couple, of a lost letter, of a consequent belief on the girl's side that her lover is no longer worthy of her, of a loveless marriage following on this belief, and of a *finale* which is happy, except in that it is necessary to get rid of the now superfluous lover. The excitement is, it is true, increased by Barbara's "Splendid Misery" being made more miserable and less splendid on account of her husband's suspecting that she is poisoning him; but the reader is never for a moment in doubt as to who is the real culprit. Perhaps neither the interest nor the pleasantness of the work is increased by the introduction of the selfish father, with whom lady-novelists have now for a long time been wont to afflict their heroines and their readers. This is a kind of trick which Miss Braddon might surely afford to leave alone. The character has, for unexplained reasons, become a stock one with certain writers. It was first introduced, if we remember rightly, by a writer of considerable cleverness and force—Miss Broughton—and for once it did well enough, although it was not attractive. But constant repetition of it is intolerable. It has not been ascertained as a fact that the head of a family belonging to the middle or upper middle class is usually a brute, and yet the study of contemporary fiction of a certain order would lead one to believe that this was so.

The *Story of Barbara* opens remarkably well with a family council between Mrs. Trevornock and her two daughters Barbara and Flossie, concerning an advertisement by which they hope to obtain a lodger in their little house at Camberwell. The conversation is lightly touched; it neither strains at wit nor sinks to imbecility. Nor are the characters either ill-devised or ill-executed, and the author is to be congratulated on having avoided giving any touch of offence to Flossie's irrepressible pertness. Perhaps it is not highly probable that a man like Captain Leland of the Honourable East India Company, home on leave and living chiefly at his club, should look out for lodgings in Camberwell; but then possibly the ways of Anglo-Indian officers some thirty years ago were unlike what they generally are now. The Captain does come, makes himself a general favourite by his pleasant disposition and by a number of little acts of attention and kindness, falls in love with Barbara, and goes back to India engaged to her. Then of course difficulties and dangers begin. A letter comes from him vaguely saying that a shadow has fallen over his life, the darkness of which he cannot ask Barbara to endure with him. She answers, telling him that so long as he is true to her and to himself she will care nothing for any accusation made against him, however hard it may be for him to disprove it. She gives the letter to Flossie to post, and Flossie loses it. Now comes the capital blot upon the story. Since Leland's disappearance, a rich but ungainly and unlovable suitor for Barbara's hand has presented himself in the person of a Mr. Penruth. Mrs. Trevornock, who has always had wild dreams of ambition for Barbara's future, greatly deplores the engagement to Leland as soon as Penruth's attentions to Barbara become marked; and she and Flossie agree between them to say nothing about the loss of Barbara's letter. This is most startling, the more so because neither of them ever appears to be fully conscious of the utter baseness of this extraordinary proceeding. In fact, it may be safely said that the thing as represented is impossible. Any one of Miss Braddon's wicked heroines of older days might have done such a thing without creating any surprise in a reader's mind; but it is altogether monstrous to represent it as being done by such people as Mrs. Trevornock and Flossie. But supposing that this impossibility was necessary, which it obviously was not, for the plot of the story, even then the course of after events is still incomprehensible. Letters—even love-letters—have been known to get lost or mislaid *in transitu*, and a girl of Barbara's temperament, with a full belief in her lover, would surely have given him another chance, instead of assuming at once that he had received her letter and had thought fit to leave it unanswered. However, if she had done this there might have been difficulties in the way of her marrying Mr. Penruth in order to secure comfort for her now invalid mother; and in that case the story would have stopped short.

She does marry Mr. Penruth; and the description of her burying Leland's letters to her on the morning of the wedding-day has considerable force and feeling. They go abroad, and she comes back listless and weary to her "gilded cage" in Cornwall. Here the story takes a new departure, and becomes less pleasant in tone. We are introduced to another set of characters, one of whom is a variant upon the old wicked heroines to whom we have referred. She is a woman of low birth and instincts, secretly married to Penruth's younger brother and heir, but passing under an assumed name as his mistress. The great ambition of her life is of course that her husband should succeed Penruth as the master of the estate; and it not unnaturally occurs to her that, as far as she is concerned, it would be desirable that Penruth should die childless. The experienced novel reader, when he hears that this notion has come into her mind, knows pretty well what he has to expect. The younger brother's wife manages to get engaged as a servant at Penruth's house, and Penruth is soon afterwards attacked with the malady which carried off his father before him —heart-disease. There is one scene, where Mark, the younger brother, has convinced himself against his will of what is going on, which is not without power. He has faced his wife, and told her that facts accuse her:—

"What facts? Who can say that I ever tampered with poison? Who can shew that I ever bought poison?"

"No need to buy the poison that grows in all our hedges. A few young foxglove leaves were all you wanted for your work. Will you go quietly, or shall I tell Dickson to put you out, or send one of the men for a constable?"

"Do you mean it? Do you mean that you can stand there, and in cold blood accuse your wife—your honest wedded wife—of being—"

The white lips faltered. Audacity was this woman's strong point, but there was a limit even to her daring.

"A secret poisoner. Yes, that is what I know you to be."

"If any one has tried to poison your brother, it must be his wife. She wants to get rid of him, that she may go back to her old sweetheart. That ought to be clear enough even to a fool like you. Didn't I see those two plotting together a month ago, and isn't he here now to see how their plot works? Easy enough for him to find out what the poison was, when it was he and she that gave it. I suppose he means to give an extra dose presently, under pretence of curing your brother. It's a deep-laid scheme, Mark; but if you weren't a fool you'd see through it as easy as I can."

"Are you going, or shall I send for the constable?"

"I am going. If I drop down dead on the way, my death shall lie at your door."

"Your life has lain at my door, and has been a heavy load for me to bear!"

"You would not shed a tear, I suppose, if you were to hear of my death?"

"Not one. I should thank God for having removed a monster from the earth."

"My children!" she cried, turning upon him suddenly like a tigress. "My three bonny boys! What is to become of them?"

"They will be taken care of; you need have no fear for them; they have done no wrong."

We do not propose to tell our readers the precise manner—ingenious enough—in which the impending catastrophe has been averted, or how things end, not indeed happily, but less badly than might have been expected. We lay down the novel having been interested in the plot, though it is composed of materials old enough, and feeling a certain regret that a writer who here and there gives indications of being capable of better things should never have attempted them. On the other hand, it may be supposed, no doubt, that by this time Miss Braddon knows accurately enough what are the wishes and tastes of her public.

THE AUSTRALIAN ABROAD.*

SELECTIONS from some lively descriptive letters furnished to the *Melbourne Argus* during a grand tour of the globe fill this pleasant volume. The writer is a quick observer of details, a tolerable humourist, and master of a crisp and nimble style. He seldom goes too far in the fashion which seems obligatory for travelling Special Correspondents, of affecting an innocent self-depreciatory kind of egotism which is nowadays deemed amusing. As a companion for a fireside visit to some of the Japanese and Chinese commercial cities, and thence by Singapore to the Dutch possessions in Java, and to the northern and eastern shores of our Australasian dominion, he will do very well. He surveys many exotic varieties of human life in a spirit free from censorious bigotry, though he has a great spite against the Dutch because they get money out of their colonial plantations. To his fancy, an ideal prehistoric civilization of the Eastern Asiatic islands is a charming vision, which the intrusion of European greediness and sordid dulness has dispelled. He is in general inclined to be rather sceptical of the presumed advantages even of our own social life and institutions, compared with the cheaper and simpler comfort of the alert and cheerful Japanese. But this we may pardon in a colonial English journalist who was going home from Osaca to Melbourne, having bidden a long farewell to London and Paris.

It was just three years ago that Mr. Hingston, after visiting India, Europe, and North America, crossed the Pacific to the Mikado's insular kingdom. Plenty of sight-seeing was ready for him on arriving in the great city of Tokio, which till lately we called Yedo; in Kioto, the ancient sacred capital; and in Osaca, an Asiatic Paris for its bustle of gaieties and light industries, an inland town of many quays and bridges seated amidst confluent rivers. To be sure, we have read many former travellers' accounts of these cities, of their entertaining fashions and manners of living. But this author's frank enjoyment of their novelty is still contagious, while his predilection for the Japanese people affords a sympathetic pleasure to the benevolent reader. That country and its inhabitants are put in such a light that our sense of moral and physical harmony is gently gratified by it. "Know'st thou the land" of such a bright exhilarating climate and delightful verdant scenery, with such a robust, active, merry, patient, good-humoured, polite, and courteous folk? They feed on fish and rice, with sips of tea and whiffs of tobacco, but do the work of horses and take it all in fun. Who would not like to live among the Japs? The "Australian Abroad," for his part, when he had compassed sea and land the whole world round, though it was in winter that he visited that country, at the fag-end of all terrestrial continents, was quite sorry to leave it.

After navigating the so-called Inland Sea, the sounds and channels between the Japanese Islands, where he narrowly escaped a midnight shipwreck, and touching at Nagasaki to express his dislike of the Dutch, our grand tourist ran over to Shanghai. His childlike pleasure in recognizing the original type of the familiar gable-roofed tea-house, with its zigzag wooden bridge of approach high over the surrounding pond or canal, depicted on the old willow-pattern plate, was an agreeable Chinese experience. But on seeing a little more of China, going up from Hongkong to Canton, he felt a humane concern for the depressed condition of its multitudinous population, miserably overcrowded, vilely lodged, clothed,

* *The Australian Abroad: Branches from the Main Routes Round the World.* By James Hingston. London: Sampson Low & Co.

and fed, toiling in hopeless drudgery, uncheered by a ray of mental light. This pitiful state of the town population met the visitor's eye as he rambled through a dizzy labyrinth of close and squalid lanes, escorted by Ah Kum, a humbug of a guide, who wore a costly gold watch, and refused to walk, sitting aloft in a palanquin. Life on the river at Canton seemed to Mr. Hingston much less unhappy; for he was placed there in charge of clever Susan, an engaging and obliging boatwoman, who embarked him with her own floating household, and carried him to scenes of amusement. There is doubtless a frightful abyss of pauperism and of desperate criminality underneath the highly conventional structure of Chinese social order and civility; but Mr. Hingston's view of it was superficial, and he does not seem to have studied the matter. His references to historical and statistical particulars are frequently incorrect, as in the dates of the British wars with China, and in the amazing estimate—perhaps, indeed, a printer's accidental error of numeration—which makes Shanghai command a plain of extent nearly equal to all the Old World. The political and military strength of the Chinese Empire seems, moreover, to be considerably underrated by this Melbourne journalist.

His view of the French settlement at Saigon, in Annam or Cochin China, is simply contemptuous; but when he gets into Dutch India, with a vehement prejudice against the nineteenth-century Hollander, we may look out for harsher scolding. It is no business of ours to plead the case in defence; but Mr. Hingston entirely fails or neglects to bring forward any substantial proofs of his severe indictment against our Dutch neighbours. Their colonial administration is likely to have its faults; but he does not show us, distinctly and certainly, what those faults are. No instances of direct oppression seem to have come to his knowledge, from one end to the other of his journeys through Sunda and Java, among some eighteen millions, as he says, of hard-working natives employed mostly on Dutch Government plantations. It is probable that their economic and industrial condition might be found to bear more resemblance to that of Bengalee opium-growers on Government account than to a positively enslaved class, such as formerly existed in the Spanish American colonies. The evidences of skilful management and of great material prosperity in the Dutch East Indies from the production of coffee, sugar, rice, and a variety of spices, making a trade by which the State gains several millions sterling a year, do not appear so very shocking. These lucrative agricultural operations, carried on in a strict and systematic manner, are described as taking up the entire available soil of Java, so far as the traveller saw, with little pasture for cattle. The native labour, which is here plentiful and efficient, requiring no importation of negroes or coolies, is superintended by about five thousand Europeans, who individually stay but a few years in that exhausting climate. Is Mr. Hingston sure that so large a native population would be able to find a tolerable subsistence without this European direction? He reproaches the Dutch, somewhat inconsistently, for not building churches and schools to teach the Javanese the ways of Western Christendom, and the next moment, for having allowed the "religion, art, and learning" of the native race to perish by a yet more culpable neglect. A more correct ethnology would perhaps have informed him that the ancient and powerful nationality, whatever it was, to which belonged the stupendous extant monuments of Buddhist architecture and sculpture, is not identical with the population now under the charge of the Dutch rulers of Java. It is but reasonable, however, on behalf of the general interests of historical science and comparative art, that the Netherlands Government should take order for the preservation, if not the further exploration, of these seldom visited remains of antiquity. We are obliged to Mr. Hingston for calling attention to the subject.

His testimony is the more opportune just now, when our learned societies have recently been furnished by Mr. William Simpson, the artist of the *Illustrated London News*, with minute descriptions and drawings of the Buddhist topes in the neighbourhood of Jellalabad. It is "a far cry," indeed, from there to Java; but Mr. James Fergusson, in his *History of Indian and Eastern Architecture* (p. 637), suggests that the Buddhist colonists of that remote island came down the Indus, and sailed round the south of India and Ceylon, instead of from the valley of the Ganges. He would lay much stress on a precise comparison of the Gandhara monastery buildings, on the north-west Punjaub frontier, with the amazing structure of Boro Buddor, which Mr. Hingston chooses to call "Boer Buddha," in the interior of Java. This is, in fact, a tope or dagoba—that is to say, a shrine for some Buddhist relics. We gladly join the "Australian Abroad" when he leaves Bantam and Batavia to their Dutch owners, and makes a pilgrimage to that magnificent temple which Sir Stamford Raffles declared to be more wonderful than the Pyramids of Egypt. It was in the brief time of the English Governor of Java, during our war with Napoleon, that "Boer Buddha" was cleared of the tangled and luxuriant vegetation which had been for ages both concealing and slowly destroying its beauties of structure and of decoration. A view of the temple is presented in the frontispiece to this volume. It consists of a solid artificial mound, square in form at the base, where it measures 350 feet on each side, and rising 200 feet in height, with eight terraces receding in the ascent, the uppermost three being circular instead of square, but the whole covered with fine stone masonry, and sustaining nearly five hundred stone buildings, cells or shrines of diverse orders, containing statues of the seated god; and all the stonework is sculptured in bas-relief with an infinite variety of groups and figures. Mr. Hingston seems not to be aware that the Dutch Government and the Batavian Society of Arts and Sciences have published very elaborate and costly works of research, to which references are given by Mr. Fergusson, concerning this prodigious monument of Buddhist art. It is likely enough that the correspondence of style, and perhaps, if it were fully interpreted, of symbolic meaning, in the artistic and historic preaching of the same creed by nations so distant from each other, might yield valuable instruction. The reading and copying of the "Boer Buddha" sculptures would be a task like deciphering some vast library of forgotten writings; there are a dozen figures, still clearly defined, in a space of two feet square. Mr. Hingston, who loves the language of exaggeration, declares that, compared with this building, the work of every modern architect "is as the squeak of a rat to the roar of a lion." He says the same, indeed, of the Taj Mahal at Agra and the Kootub Minar at Delhi. The Buddhists, in his judgment, being a third of the human race, should have something to say for their religion. Not that the "Australian Abroad" knows much of its doctrines, or of their past effects, which have been debilitating, upon the East Asiatic nations. He only thinks that its Javanese and other votaries must have had "an inner beauty in their lives," judging from these "outward and visible signs of it." It is not safe, however, to rely on the presumed sacred motive of sumptuous and ostentatious temple-building, in any style of art, whether for Christian, Mussulman, or some fantastic heathen worship.

Other Buddhist remains in Java are also visited. The temple of Moendoet, near that of "Boer Buddha," contains three colossal female figures of stone. The central statue, one of "a goddess sitting and counting her fingers," is eighteen feet high, and may "challenge the works of all sculptors, ancient and modern." This is Mr. Hingston's description of it; but Colonel Yule, in the *Journal of the Asiatic Society of Bengal*, 1862, makes it a nearly naked statue of Buddha, eleven feet high; and the two attendant figures are thought to be Vishnu and Siva, indicating a compromise between Buddhism and Hinduism. The external sculpture is copied, in part, from a cave temple at Karli, between Bombay and Poona. At Prambaran or Brambanan are the ruins of three temples, which seem to have been planned and adorned like that of "Boer Buddha," though of smaller dimensions. Two lines of railroad, one from Batavia to Buitenzorg the other from the port of Samarang to inland native towns called Soerakajarta and Djockjakarta, which names are shortened into Solo and Jockio, give access to the interior of Java from its north coast. The author found it easy by these means to visit the petty mock courts of a native Emperor and Sultan, who are pensioned off by the Dutch Government, and are permitted to keep a few soldiers, as well as pet lions and tigers. He was enchanted with the rich loveliness of tropical scenery, and was pleased to verify by actual experiment the disproof of the alleged poisonous influence of the Upas tree, showing with a lucifer match that it is the earth below the suspected tree which emits carbonic acid gas fatal to a sleeper on the ground.

Departing from Java by a steamer which then began monthly running to North Australia, in order to visit the remote colonial settlements about Port Darwin and the shores of Torres Straits near Cape York, the returning Australian journalist was no longer "abroad." His account of those struggling North-coast settlements, Palmerston and Somerset, which belong, curiously enough, to the territorial jurisdiction of South Australia, is not very encouraging; their goldfields are a failure, and the places only exist as Government posts and telegraph stations. Mr. Hingston ekes out his volume with narratives of hasty visits to Sydney and Adelaide, and several chapters of a tour through New Zealand. He contrives to be generally entertaining; but there is little for him to add to previous information regarding our Australasian colonies.

RIBOT'S CONTEMPORARY GERMAN PSYCHOLOGY.*

THE present condition of philosophy in France, if it cannot be called flourishing, may at least be spoken of as hopeful. The orthodox followers of Cousin and the Scotch philosophers do not indeed appear to exert much influence, notwithstanding the prestige given them by their official position. On the other hand, a great deal of activity is manifest outside the ranks of the authorized school. Some small part of this vitality is expended in the production of independent or partially independent systems of thought, among which the writings of M. Rénouvier stand pre-eminent. By far the larger portion of this philosophic industry, however, is devoted to the selective assimilation of the best contemporary foreign work. A number of writers have distinguished themselves by a careful critical estimate of the leading English and German thinkers. A glance at the *Revue Philosophique*, so ably conducted by M. Ribot, will show how eagerly the French mind seizes and appropriates whatever is new and significant in the philosophical literature of their countries. The side of philosophical work which seems most powerfully to attract the French student is modern psychology conceived as a positive science, and as based on biological data. M. Taine's brilliant work, *De l'Intelligence*, gave ample proof of a close study of the newest researches in what may conveniently be called physiological psychology. But the writer who has most

* *La Psychologie Allemande Contemporaine.* (Ecole Expérimentale.) Par Th. Ribot. Paris: Librairie Germer Baillière et Cie. 1879.

signalized himself in this work of critical exposition of foreign work is M. Ribot. This author has shown himself capable of original speculation in his striking little work on Heredity. But for the most part he has laid himself out to master and expound the recent developments of psychological research in England and Germany. His work on contemporary English psychology, the value of which as an exposition is sufficiently attested by the fact that the English version is frequently used by our younger students as an introduction to the subject, illustrated at once his power of seizing the central ideas of a writer, and his critical acumen. He has now supplemented this work by a volume on contemporary German psychology. It is probable that this is a subject very little known to English students of psychology. It is true that Mr. Sully in his volume of essays, and in the pages of *Mind*, has given a summary of all the principal lines of investigation here traced by M. Ribot. But these detached papers leave ample room for a full and connected exposition of this department of psychological work. Hence M. Ribot's book ought, one should suppose, to attract considerable attention in England.

In an introduction, which is pitched perhaps in a rather high key, M. Ribot shows how thoroughly he sympathizes with the intellectual movements which he is about to describe. This introduction is, in truth, a very confident shout of defiance directed to the orthodox camp. The old psychology, by which term M. Ribot means both a metaphysical and a purely subjective psychology, has, according to him, amply proved its incompetence. M. Ribot seems disposed to go almost as far as Dr. Maudsley in his contempt for the introspective study of mind, which, he says, cannot be shaped into a scientific method. All interpretation, all explanation of mind, must come, according to our author, from the region of biological law. He ridicules the way in which certain members of the introspective school coquet with the new physiological method. "Their concessions save nothing. However sincere they may be in their intentions, as a matter of fact these are not carried out. As soon as they put their hand to the task the taste for pure speculation seizes them again. Besides, no attempt to reform that which is radically false can be effective, and the old psychology is a bastard conception, which is destined to perish by the contradictions which it includes." It is possible that others besides the French chair-philosophers will feel this introduction to be a little too strong. We venture to predict that for a long time to come recourse will be had to the old-fashioned introspective way in the higher branches of psychology. The laws of our more complex intellectual and emotional life cannot yet be reached from the physiological side. Much may, no doubt, be done by an objective study of mind in its collective manifestations in national life, &c., but there will still remain many difficult problems of analysis, the solution of which requires, before anything else, a fine introspective insight.

How small is the mental territory to which the physiological method is as yet applicable is strikingly illustrated by M. Ribot's present account of the German physiological psychologists. The stress of their efforts has been directed to the problems attaching to sensation and sensuous perception. What are the precise physiological conditions of sensation; out of what elementary processes do our seemingly simple sensations arise; how is the element of inference in sensuous perception determined; how far can sensibility be measured objectively—that is to say, as a function of physical processes?—these are the sort of inquiries with which German workers have busied themselves. The value of these labours, carried on almost exclusively by trained physiologists, is placed very high by M. Ribot, and justly so. For, as he says, these workers have succeeded in introducing into psychology something like physical experiment. Yet, while fully recognizing the great utility of these researches, we should do well not to ignore their limited range. M. Ribot seems disposed in this volume to place the work of the Germans above that of English psychologists like Professor Bain, Mr. Herbert Spencer, and Mr. G. H. Lewes. He speaks of English psychology rather too loosely as a descriptive rather than an explanatory science. But, in truth, all the writers named above, more especially the last, have distinctly aimed at that kind of physiological interpretation which M. Ribot so greatly commends in the Germans. The determination of the relative scientific value of contemporary English and German psychology turns mainly on the question how far the method of objective experimentation is applicable to mental phenomena, and whether it is likely to yield any results of a large and general character worthy to take rank among laws of mind. So far, we think, and M. Ribot seems inclined to agree with us, these researches, though full of interest and throwing a flood of light on the circumscribed region of phenomena with which they are directly concerned, have failed to furnish any such wide generalizations. It is doubtful indeed whether the conclusion which most closely resembles a comprehensive induction—namely, Fechner's law, to be spoken of presently—is universally valid even in the region of sensory stimulation. This being so, it seems rash as yet to underrate the old methods of psychological inquiry, improved as they have been of late by the addition of strictly objective investigations in animal psychology, the comparative psychology of races, &c.

The group of investigations of which M. Ribot here gives an account, are not, as he remarks, closely connected by any common underlying principle corresponding to that of association in English psychology. They have been carried out mainly by physiologists, the nature of whose special studies has compelled them from time to time to enter the territory of psychological problems. Thus they have so much in common that they set out from the experimental sciences as their starting-point, and adopt a certain positive fashion of treating psychological questions. One of the main branches of this German psychological investigation has been the attempt to give quantitative precision to mental phenomena, to measure sensibility and its variations. The impulse to this kind of research seems to have been given by the metaphysician Herbart, who, adopting a strictly *à priori* and metaphysical method, endeavoured to find a mathematical expression for all mental processes conceived as the manifestations of certain fundamental opposing forces. Accordingly M. Ribot commences his exposition by a brief account of Herbart's curious mathematical psychology. It is no doubt in its method sufficiently unlike the genuinely scientific work of later positive workers, but it deserves to be studied in this connexion as showing how the German mind has been carried forward in the endeavour to bring psychology up to the level of the physical sciences in respect of quantitative exactness. From Herbart M. Ribot passes to that particular development of his doctrine known as ethnographic psychology (*Völkerpsychologie*). After this he gives us a sketch of Beneke's psychology, and then comes to his principal subject—namely, the psychology of the physiologists. We do not much like this arrangement of material. If there was any need of dealing with Beneke's psychology in this place—and it seems to have no bearing on M. Ribot's main subject—it should, we fancy, have been taken immediately after Herbart's system, while the comparative psychology of the race, based as it is on a properly objective method and being still in its infancy, might with advantage have been given after the physiological psychology.

The psychological question which the German physiologists first began to handle is the genesis of our space-perceptions, and more particularly the visual perception of direction, distance, unity of object, &c. The dispute carried on between the two parties named by Helmholtz the Nativists and Empiricists has to do with a properly scientific question—namely, the way in which these space-perceptions manifest themselves as phenomena in time. It does not, strictly speaking, touch the Kantian problem of the ultimate origin of the notion of space. The writer who shaped the question was the celebrated physiologist, Johannes Müller, who was no doubt largely influenced by Kant's conception of space as a subjective form of sensuous perception. M. Ribot furnishes an interesting account of this dispute, a sketch of which appeared in *Mind*, the beginning of last year, giving special prominence to Lotzes' ingenious doctrine of local signs. The arguments of the Empiricists appear to M. Ribot as they do to ourselves by far the more convincing. Yet the writer fully sees the difficulties which beset the question both in the limitations of objective experiment, and in the impossibility of separating the elements of immediate original sensation and acquired inference by an introspective analysis of our perceptions.

After sketching the history of the space-question in Germany, M. Ribot expounds the psycho-physics of Fechner. He gives a very clear and intelligible statement of Fechner's law of stimulation, namely, that when the stimulus increases in arithmetical progression, the sensation (as measured by the smallest perceptible variations) only increases in geometrical progression, that is to say, by some constant fraction. He further appends a valuable account of the criticisms which Fechner's doctrines have called forth. Fechner assumes that the peculiar numerical ratio just described applies to the relation between the physiological and the psychical process. That is to say, he conceives the nervous process to increase in the same proportion as the stimulus or external physical process, while the mental process fails to increase in the same degree. Fechner's critics, however, make out a good case for the supposition that this falling off takes place in the nervous process. The arguments of Delbœuf on this point, going to show that owing to a law of nervous fatigue increase of stimulus produces less and less physiological effect, seems to us to be especially interesting and valuable.

The rest of M. Ribot's volume is taken up by a very full exposition of Wundt's system of physiological psychology, following the order of that writer's last work, *Grundzüge der physiologischen Psychologie*, and by an account of the experimental inquiries into the duration of mental processes, where again our author follows Wundt's exposition. There is something unsatisfactory in this way of treating the subject—partly by topic, partly by book. Thus M. Ribot is compelled to take a good slice out of Wundt's work when dealing with the space-question, and again when treating of the investigation of the duration of mental processes. This want of a simple method of presenting the subject seems the less excusable as much of Wundt's work, though called physiological psychology, is not based on objective methods at all, but is largely speculative. If M. Ribot had wished to give his readers an idea of the full scope of the new psychology in Germany, he might with advantage have added a *précis* of Wundt's work by way of an appendix. We are fully aware of the difficulties of giving an orderly account of a number of detached and fragmentary investigations like those here dealt with; but we think a greater appearance of systematic plan might easily have been secured. It strikes us, further, that M. Ribot would have done well to incorporate some of the results of Helmholtz's researches into the conditions of visual perception as illustrated in the phenomena of chromatic contrast, &c. Helmholtz's great work on physiological optics contains something like a complete doctrine of sensuous perception; and this is by no means the least valuable contribution of German

physiologists to the new psychology. It may be added that, if M. Ribot here and there fails to hit on the best arrangement of his material, his style, by its great perspicuity, does much to make up for this defect. The young student of psychology cannot do better than take M. Ribot for his guide. He is fully master of his subject, and he thoroughly understands the art of setting forth the ideas which he has acquired.

DUNCKER'S HISTORY OF ANTIQUITY.—VOL. III.*

THE opinion which we expressed (February 16, 1878) on the first and second volumes of Professor Max Duncker's *History of Antiquity* applies with equal justice to the third. Mr. Abbott has not spent his time on a profitless task, and he has certainly succeeded in presenting the book to English readers in an almost faultless English dress. There are perhaps not more than two or three sentences in this volume which we could wish to have altered, and in these the flaw would be removed by a slight transposition of words. The antecedent and the relative are awkwardly separated in the following sentence:—"Esarhaddon undertook to subjugate Syria again to the dominion of Assyria, which his father had given up after raising the siege of Jerusalem." A translation which is open to no severer criticism than this is almost perfect. Of the work itself we may say again, as we said before, that it is one from every part of which the student may learn much. For Professor Max Duncker the history of the world exhibits an organic unity; and, although all the parts are by no means of the same importance, there is still no portion which can be profitably studied without reference to any others, and none which will not repay the labour which may be bestowed upon it. In the present volume he traces the long series of causes which after the fall of the Babylonish empire raised Persia to its overwhelming predominance in the ancient Eastern world; and in tracing them he takes care to point out the links which connect these causes with the conditions of thought and belief in the Aryan world of modern Europe. Even the Semitic kingdoms, which may be said never to have known any law beyond the will of a despot, may teach us lessons which we cannot afford altogether to despise; but when these empires come into contact with communities like those of the Greek subjects of the later Lydian kings, or again like those of the Jews, we see how far-reaching the effects may be, and we may feel ourselves justified in discerning through all of them the working of a wisdom higher than that of man. There is the more need of insisting on this because the most valuable parts of this volume may seem at a first glance to point to a different conclusion. The ritual and practice of the surrounding nations determined, in Professor Max Duncker's opinion, the development of Judaic monotheism; and the highest convictions of the Hebrew prophets were forced home to them by the horrible evils which characterized the religion of their neighbours, and indeed of their own countrymen generally. The idea of an absolutely righteous and all-powerful God, whose dominion is the wide universe, was awakened in their minds by the frightful results involved in the worship of gods whose power was bounded within definite or local limits. If on this ground we infer that the growth of religion amongst the Jews depended wholly on their own intellectual activity to the exclusion of any higher influence, or, to speak more plainly, of any Divine direction, we are not more wise than if we assert that language was produced by unaided human effort because words expressing our highest spiritual conceptions are derived from roots which at the outset denoted nothing more than purely physical notions or wants.

In a work which is virtually a universal history of the ancient world space is a matter of no little consequence; and we might therefore be tempted to regret that, even for the purpose of giving force and clearness to his arguments, the author should have filled so many pages with quotations from the historical and prophetical writings of the Old Testament. But the fault may perhaps be pardoned when we remember how often works of this kind sin in the opposite way by stringing or rather massing facts together without the smallest sense of proportion, or without imparting to them the feeblest spark of life. From such dry summaries the reader may well turn with a feeling of satisfaction to the chapters in this volume which show how far the spirit of Hebrew prophecy affected the fortunes of the Jewish nation, and how far, in the furtherance of their own purposes, the prophets employed means as to the rectitude of which there may be differences of opinion. That after so long a series of incompetent or unfortunate rulers the kingdoms of Israel and Judah should be governed at the same time by two such monarchs as Azariah or Uzziah and Jeroboam II. was a noteworthy coincidence. To all outward appearance these kings brought back the country to a condition of prosperity not below that which it had enjoyed even under David or Solomon. Its foreign trade, its internal discipline, its military energy, all underwent a marvellous revival; but in neither kingdom were there any signs which pointed to anything more than a material recovery, while there were many tokens that fatal changes for the worse were going on. There was no evidence that either in Judah or in Israel a more steady political cohesion could be looked for, while there were significant tokens of coming storms in the dark clouds discerned on the political horizon by the keen instinct of the prophets. In the meantime the energy of these two monarchs had restored to their dominions something of their ancient splendour; and the natural effect was a luxuriousness of living which ran into a more ostentatious display of the sensuous Syrian religion. Samaria more especially became filled with magnificent palaces, adorned with the utmost extravagance of Eastern voluptuousness, and the selfishness of the rich had its natural consequence in a grinding oppression of the poor. Of the nature of the ritual which fostered or produced these wretched fruits, it is unnecessary to speak more particularly. No reader of the prophetic books can have failed to form a more or less definite idea on this subject. It is enough to say that the dangers which threatened the kingdoms of Israel and Judah from the quarter of Assyria pointed to the need of an immediate and thorough political combination of all the Syrian nations, if the latter were to have the least chance in the coming conflict with the lords of Nineveh, and that the horrible excesses of Syrian worship, by rousing the indignation and giving strength to the protests of the Hebrew prophets, rendered this political combination impossible. The immediate result may have been the downfall of both kingdoms; but happily the consequences did not end here. The lessons burnt as with a hot iron on the hearts of the prophets kindled in them a spiritual conviction which insured the coherence of the Jewish people when the fabric of the old Mosaic polity had been shattered by those pitiless invaders.

That to this cause alone we owe the endurance of the Jewish society in its national aspect after the destruction of Jerusalem and the Temple by Nebuchadnezzar is proved by the complete disappearance of the Northern kingdom under precisely similar circumstances. In the times preceding the establishment of the Jewish monarchy Jehovah had been to the descendants of Jacob a tribal God, more powerful indeed than the gods of surrounding nations and more righteous, but nothing more. In devotion to him they were united as a people, and the geographical conditions of their country, which to a large extent cut them off, as Professor Max Duncker puts it, from the life of the maritime cities and the life of Damascus and Hamath, fostered this feeling of nationality. But the sensual and cruel Syrian worship still had a strange attraction for them; and the horrible life which sprang from this religion brought home more and more to the minds of the few the utter hatefulness of the whole system in the sight of the God who had brought their fathers out of the land of Egypt. The Syrian gods were entirely sensuous; the God of Israel, although ruling the physical world, must not belong to it. No human passion must mar the beauty of his holiness; no partiality must sully the equality of his justice. This "supernatural point of view," to use the author's words, "disrobed the idea of God of every material element which still adhered to it"; and this idea was more and more dissociated from its connexion with a visible temple and a sacrificial ritual. "What can the holy and just Lord in Heaven care for offerings of food, frankincense, and drink? The lips and the heart must be elevated to his greatness, his commands must be kept, and men must make themselves holy as he is holy. The only service of the holy God is a holy and righteous life. Sacrifice is not required, but recognition of God, simplicity, chastity, and moderation." In this way the religion of the Prophets (for by this title we must speak of the scanty minority which proclaimed this higher faith) was moulded into the majestic form with which it is invested in the words of Isaiah and the great teachers who followed him. The advance thus made was vast indeed; but it would have been beyond measure marvellous if their discernment of the Divine righteousness had enabled them at once to rise to a comprehension of the Divine work in the training of mankind regarded as a whole. Even the book of Job (for we may fairly take it for granted that this book belongs to an earlier age than that of the greater prophets) seemed in its final picture to reassert the conclusion which in previous chapters it had so earnestly opposed; and the prophets, while they insisted on the impartial condemnation and punishment of all sinners, insisted not less positively on the consummation of the Divine judgments during the present life. The theory may not have taken a very definite shape in their minds, and the circumstances under which it was framed left room for a certain amount of inconsistency of which they might remain unconscious; but the idea of a recompense for iniquity, to be inflicted visibly in the sight of the world, took deep root in their minds. The people hankered after the lascivious Syrian worship; and this worship, allowing unbounded licence to the animal passions of human nature, reduced the notion of religion to the mechanical performance of outward acts. It struck, in short, at the very foundations of all that deserved the name of religion, and left the soil dead for the growth of a purer faith. For such iniquity must there not be a sure visitation? Must not the Divine sentence go forth against the rulers who kept up such a system, and against the priests who played into their hands? As to the instruments to be used in the execution of this sentence, could they be in doubt? Their past history showed that the idolatries of the people had interfered with their growth and coherence as a nation, and had left them powerless against the attacks of invaders; and now, behind and beyond the Syrian kingdoms, which thus far they had had most reason to dread, the dark cloud of Assyrian power was gathering volume and casting its awful shadow over the land. The catastrophe, they saw, could not be averted, although it might be delayed, by the repentance of the people; but whether before or after the judgment Jehovah would remain still the righteous and merciful God, who desired only that the sinner might turn from

* *The History of Antiquity.* From the German of Professor Max Duncker. By Evelyn Abbott, M.A., LL.D., Fellow and Tutor of Balliol College, Oxford. Vol. III. Richard Bentley & Son. 1879.

his wickedness and live, and the prophets clung to the conviction that even the ruin of the city, the fall of the people, and the scattering of the nation, would not interfere with the final restoration of Israel and the advent of an age of true and just dealing, in which the instruments of war should be turned into ploughshares and pruning-hooks, and the earth should be filled with the knowledge of the Lord as the waters cover the sea.

In these convictions Professor Duncker finds the key to what may be called the political action of the prophets. Christian teachers, under the assurance that things here are merely tending to their consummation hereafter, are content to assert the laws of right action and the ultimate vindication of the divine justice. But to such limitations the Hebrew prophets had not yet reconciled themselves, and they vehemently interfered in matters which would now be regarded as strictly political. To them it was strictly a question of religion whether the government should ally itself with Syria or with Egypt; and, as in the case of Jeremiah, the prophet might set his face against the popular alliance and insist on submission to an irresistible invader with a pertinacity which might draw on him, not altogether without some show of justice, the suspicion of deliberate treason. The first and the paramount need, therefore, was that of a national reformation; and after a long series of efforts the prophets, in Professor Duncker's belief, resolved to add a supplementary law to the ecclesiastical enactments thus far in use. The true religion could not be found in the Levitical Code:—

> The detailed rules for the priests must be removed; a law-book for the laity was required. For this purpose the regulations scattered through the old books were collected and arranged into a compendium of the requirements which every Israelite had to fulfil. The new conceptions of the prophets must be assimilated to the old regulations, and these brought into harmony with the deeper views of the prophets.

The lofty language in which this law was set forth is "evidence of the effect subsequently exercised by the prophetic mode of conception and expression"; and its contents pointed also unmistakably in the same direction. Such, he thinks, was the origin of the Book of Deuteronomy, in which the prophet fixed "the relation of inspired religion to the rites of worship." In the sufferings which fell on the country during the reigns of the later kings the priests had, like the prophets, reason "to regard the faith of Jehovah in a more inward manner and plant it more deeply in the hearts of the people." The ritual became thus a bond of union, which, far from becoming weaker, gained strength during the bitter time of exile; and thus the union between priest and prophet was completed in the person of Ezekiel. No prophet had declared in more unequivocal terms the universality of the method of Divine government and its absolute impartiality; none had insisted more earnestly on the indispensableness of inward purity, and further, on the efficacy of hearty repentance; but

> his announcements [Professor Duncker urges], are strongly coloured by the priestly point of view on which he takes his stand. He maintains strictly the rubrics and customs of worship, the correct offering of sacrifice. It was a comfort to him in his sorrow to imagine, in minute detail, how the Temple is to be restored with all its buildings, the land divided among the tribes, what was to be allotted to the priests, and what duties would devolve upon them, if Jehovah should restore Israel again out of the captivity.

The foundations were thus more surely laid of a society which returned to its old home with a clear conviction that the life here is only a preparation for the life hereafter; and a momentous step onwards was gained in the interests of mankind amidst the shifting and perishing elements of the Eastern despotisms which, so long as they last, seem absolutely immovable.

From the history of these cumbrous and unwieldy empires Professor Duncker turns to notice the strange and mysterious tribes who were interposed between the Asiatic and the European world in the desolate regions to the north of the Euxine and the Caspian. Here, as elsewhere, his fault lies in the direction of too much quotation. The descriptions of their customs and modes of life, as given by Herodotus, might have been compressed into as many sentences as they now occupy pages; but we must content ourselves with noting his important conclusion that the widely extended hordes of Sarmatians, Scoloti, Arimaspians, and others, comprised in the great body of Scythians, were Aryans in speech and descent. Sweeping away the arbitrary explanations of Greek writers, who saw in the Arimaspians men with one eye in the middle of their faces, Professor Duncker discerns in their name the old Aryan *airyamaçpa*, or the men who have obedient horses. In the name of the three progenitors of the Scoloti, Lipoxais and his brothers, he finds the Aryan *Kshaya*, or prince; and in the story told about them he sees a repetition of the myth of Mithra, Thraêtana, and Kereçaçpa. The Paralatae are the *paradhata*, the advanced, or the *pararata*, or leaders. "Tabiti, the name of the goddess of the Hearth, means in Aryan 'the burning,' 'the illuminating'; just as the name of the deity, Oitosyrus (perhaps *vita-çura*, strong with the bow), reappears in the Persian name Artasyrus." Many of the geographical names yield, he thinks, the same results. "The names of the rivers Tanais and Borysthenes, *vouruçtana*, would mean in old Aryan the 'outstretched' and 'having a broad strand.'" If it be so, the conclusion follows that these tribes "must have separated themselves from the community of the Aryans before the eastern branch were in possession of the Punjab, and the middle branch in possession of Iran, and there arrived at the religious conceptions expressed in the hymns of the Rig Veda, and in the creed of Iran, as it existed before Zarathustra." In two excellent chapters on Lydian history, Professor Duncker points out the real position of the Lydian kings in reference to the Greek settlements which cut them off from the sea, and the full extent of the consequences involved in that which the Greeks themselves chose to call the conquest of Ionia. His argument brings out into rather strong relief the inherent and, it would seem, the incurable vices of the Greek political character. We can only add that he makes a strong effort to retain as historical the Herodotean narrative of the interview between Crœsus and Solon, his contention being that this interview took place in the last year of Solon's life. There are not a few, perhaps, who will regret that the evidence in support of this plea is so weak as to have practically no value.

IN THE SWEET SPRING-TIME.*

THE author, in describing the heroine on a certain afternoon, says that "the slumberous part of her nature had asserted itself." When we came to this passage—and we were well on in the third volume before we reached it—we felt how accurately it described the state in which we had been ever since we had taken up Mrs. Macquoid's novel. As we reached the last page, and our tired eyes closed, and the book dropped out of our weary hands, we felt that we might cry out with Bottom the Weaver, "I have had a most rare vision. I have had a dream, past the wit of man to say what dream it was." How, indeed, can we tell what this most rare vision has been? The author has through three long volumes attempted to describe nature; but we are scarcely bold enough to venture to describe her descriptions. We had not read far in the book before we saw where our chief difficulty would lie; and we at once began to take notes, so that we might be able to follow her in her "word-paintings." We began by doing our best to get before us a clear picture of the heroine, Martha Burridge. "Stay!" our lady readers will at once exclaim. "Surely you must be mistaken. No heroine for many a long day has answered to the name of Martha. They are all Mauds, and Ethels, and Gwendolines." We hasten to admit that in one way Martha is not the heroine, as she does not marry the hero. For him a Gyneth is provided; and Gyneth is a name which no heroine need be ashamed to bear. But Martha does well enough, even in the present refined day, for a poor girl who dies towards the close of the third volume of a broken heart and a ducking in the sea, and so makes way for her happier rival. Still, though she has that untimely end, yet it is on her that the chief interest of the story rests. The reader has a secret hope that after all it will turn out that her fate is happier than her name and her nature seemed to denote. We, at all events, observed her from the first much more carefully than we did her rival Gyneth. Certainly we were not a little struck by the colour of her eyes. Gyneth had merely liquid dark eyes, velvet-like eyes, eyes in which different emotions seemed to call out different hues in the green-grey ring round the pupil. Such eyes are not to be despised in themselves; but most certainly they are not the eyes of one who is to play the leading part in a long story. When compared with Martha's they are almost insignificant. For hers were "singularly green." At one time they had in them dry intenseness, and then in a moment it had fled, and they were full of soft, dark-green light. Two pages later they were sombre with despair. Sometimes the intenseness and the greenness would seem to be found together, for on one occasion we read that they were full of intense green light. Whether it was dry intenseness we are not told. Later on we are told of her deep green eyes. Then we find that the rings below her eyes, which had been purple, were now a dull brown. Next they have a depth of sweetness in them, and then a gleam of green gold darts from them. A few pages further on, an admirer says "Her eyes are so very beautiful, green-gold, and sometimes they look black when the pupils dilate." In the third volume we first learn that these green-gold eyes had a golden veil of lashes, and that they were dark, glowing eyes, that looked almost black with excitement. Her hair was not unworthy of her eyes. It was of a rich deep red, golden at the edges, lying in thick straight masses across her forehead. These rich red masses of hair, we read in another passage, were much too thick to lie flat on her forehead. She had a rich red gold crown of ruffled hair. Her face was crowned with a ruddy wealth of hair. We like to picture her to ourselves in her best gown, a myrtle-green silk. As in the mind's eye we see her green-gold eyes, her red-gold hair, and her myrtle-green dress, we have not certainly before us what the author calls a whole gamut of glorious colour; yet we have, at all events, a green and gold and ruddy wealth. Very fine is she also a few days before her death, when "she smiled proudly; she was very pale, but she looked royally beautiful, her eyes full of dark liquid light." *Dark light* would sound somewhat oddly, were not the two words happily separated by *liquid*, which comes in very well between them. If the reader considers these descriptions carefully, he will see that, after all, the heroine's beauty might have been set off in the few words in which the author hastily sketches a cat. It was, she writes, of carrotty appearance with bright green eyes. The old porter to whom the cat belonged had yellow-green eyes. Had he been young, rich, and a hero, both he and his cat would no doubt have boasted of green-gold eyes, full of soft dark liquid light and dry intenseness, crowned with a ruddy wealth of hair.

* *In the Sweet Spring-Time: a Love Story.* By Katharine S. Macquoid, Author of "Patty," "Diane," &c. 3 vols. London: Hurst & Blackett. 1880.

Both the heroines were in love with the same hero, and both the heroes were in love with the same heroine. Poor Gyneth for a long time thought her chance was hopeless, and she had good reason for her despair. "She looked across at Miss Burridge, and her last hope faded, shrivelled under the light of those intense eyes." It is not light, but heat, that as a general rule shrivels anything up. But who can be rash enough to pretend to say what effect might be produced by a pair of eyes such as we have described? She might have taken comfort had she known, as the reader does, that her rival had taken to shivering without any sufficient reason. Yet, on the other hand, one day when the air was warm, it had seemed to Gyneth, too, that there was a shiver in the scene, and a strange, heart-stirring sob among the pine-trees. This shiver and this sob were perhaps sufficiently explained. The wind, we are told, moved the branches. If she had some of the alarming experiences of the other heroine, at all events on no single occasion did a gasp quiver in her throat; nor had she a brother across whose brain, while she herself was lying at death's door, strange powers of divination lightened broadly. She was meant to marry, and marry accordingly she does. We, for our part, could have seen her hanged with much complacency, for we were heartily tired of her long before we were allowed to take leave of her at "grey old Fulham Church." And yet there is much no doubt in these funny volumes that will charm many a romantic reader of the present day. In the first place, a passage like the following has such an appearance of philosophical reflection, that we are sure it will be read with pleasure by not a few and not be detected as arrant nonsense:—

When one considers the importance of a man or woman in the scheme of creation, compared with that of a cloud, or a tree, of an ocean, or a wind, or any mere natural feature, it seems strange that mental atmosphere should not have the attributes of the atmosphere of nature; that frost and east wind should make themselves felt from one end of our island to the other, and yet that a corresponding mental atmosphere should not spread, if not from one end of the land to the other, at any rate from one home to another in adjacent places. This is a question which has yet to be investigated, for that the fact exists sometimes, is beyond dispute.

The descriptions of scenery, moreover, are so minute that they will excite no small admiration in all who know nothing of nature, and who at the same time attach next to no meaning to words. For instance, the author describes the sea. It was, she writes, in intensely blue beauty. It was framed in by the feathery green of the trees overhead. Where was the sea, we may well inquire, if the trees overhead framed it in? But to pass on. The sea was welding purple and rose, gold and crimson, into sweetest and most perfect harmony—a pearly grey. *Welding* a few years ago would have struck any one as a curious word to apply to the sea and to colours also; but our authors—especially our lady-novelists—are so rapidly accustoming us to nonsense that it is really very hard to remember that words have any particular meaning of their own. Even a live shrimp is too much for our author's control over her language. It flits to and fro, we read, like rays of light, transparent, and seemingly impalpable. A few lines further down it becomes a bright transparent atom. One of the heroes travels by railway; and, as might be expected, he looks out of the window. "He looked overhead. The fleecy white clouds were lying lazily along a pale bluish ground, and had a family likeness to the fat elms below, there was so little form in them." Here it might be justly thought that our author had reached her very tether in nonsense, with her fleecy clouds on a bluish ground, that were like fat elms which have so little form. But we are not sure that she does not go beyond even this in one or two places. She describes the Thames. It showed a phantom-like grey with a rose-coloured reflection of the sunset. It was of a luminous grey, with angry flame-coloured patches on the grey waters. Before long the stealing grey lost its luminous weirdness. In her opening paragraph she tells us that the day seemed tired of the dry heat. A little way lower down she says that the shocks of corn stood leaning one against another as if they too were faint and weary with the long day's heat. Let us be thankful that she does not take us through the whole parish, and tell us of the faint and weary look of all things on this day that seemed so tired, from the mop-stick and broom-handle that leaned as if exhausted against the wall, to the pump-handle that hung down wearily towards the ground.

If Mrs. Macquoid must describe minutely, let her keep clear of nature, and find out where her strength really lies. She is best at describing a conversation between ladies. She rarely forgets to tell her readers how each one looked as she spoke. Thus, in the fourth chapter of the second volume we have really a very clear picture of all that took place in a scene at the village post-office. The conversation, indeed, we found almost impossible to read, but at a glance we could see the various changes which passed over the heroines as it went on. We were able thereby to make some kind of guess at what they said and what was said to them. Some amusement can almost be got out of the book by thus skimming the opening words of each paragraph. We can busy ourselves with guessing at the course of the conversation. We are like a deaf person in the midst of a group of silly chatterers. He can watch their faces, guess at what they are talking about, and escape the annoyance of hearing their words. Thus, in this chapter, as our eye glanced rapidly along we read, "Martha struggled not to be shy," "Martha's cheeks grew rosy," "Gyneth came a little forward," "Martha tried to harden herself," "Gyneth smiled," "Gyneth spoke hurriedly," "Martha gave her a sidelong glance," "Martha's nervous flush deepened," "Martha's eyes dilated," "Martha glanced quickly," "Martha smiled," "Martha smiled more easily," "Martha laughed," "Martha reddened," "Martha looked at him with a long, suspicious glance," "Martha smiled," "Martha smiled spite of herself," "Martha smiled and was flushed with pleasure," "Martha was silent." We are told, moreover, how Gyneth's sister Louisa sighed, and smiled, and looked fretful, and brimmed over with triumph, and laughed merrily. This goes on from chapter to chapter, from book to book, and from volume to volume. It is very dull reading, no doubt; but it is, at all events, a great deal better than what the author calls Nature, and what any one else would call nonsense.

It is, we fear, almost useless to go on, as we do, protesting against the floods of fine, but very foolish, words that our novelists keep pouring out. The stream never lessens in its volume for all our utterances. Against dulness even the gods fight in vain; and at the present time dulness is doubly strong, for it has fashion for its ally. We can only hope that we may live to see the time when the tide shall turn, and when the picturesque rant of the present generation of novelists shall have given place to simplicity and nature.

XENOPHON IN MODERN GREEK.*

PROFESSOR BLACKIE of Edinburgh is not one of those scholars who espouse a theory by halves or swallow a principle otherwise than whole. And nowhere has he shown this more energetically than in his advocacy of the practice of teaching and learning Greek as a living and spoken language. Those who have read his papers on Modern Greek, Greek accent, and Romaic literature, and glanced at prefaces which he has contributed to handbooks (with which we are not now concerned, but which we can believe to be very valuable in the acquirement of modern and colloquial Greek) must have smiled at the sweeping way in which the Edinburgh Professor seems to find it impossible to aggrandize modern Greek without casting comparative scorn on the old. He sets much store by the gain to scholars and students of the sacred Scriptures to be derived from the modern language, which he pronounces to be identical with that in which St. Paul addressed the Athenians on Mars' Hill; and apparently subordinates precision, succinctness, and taste to the questionable advantage of mastering a colloquial modern phraseology which, whatever we may think of it, we must not call mongrel or hybrid. Old-fashioned scholars, on the other hand, will recall the story of a scholar of a quarter of a century ago who went to the opposite extreme, and discontinued the study of his Greek Testament because he found it corrupted his knowledge of the pure and classical Greek; and to all arguments for the new and compendious mode of picking up Greek (not simply for speaking, but with a view to its literary use) as young men acquire German, French, or Italian for mercantile purposes, by conversation, they are apt to rejoin, "No man having drunk old wine, straightway desireth new; for he saith, the old is better." As long ago as the 10th of August, 1867, we reviewed in these pages the lucubrations on Homeric questions of a modern Greek in his own tongue, and found that his vehicle of language admitted of his describing a Dutch nobleman as *Ὀλλανδὸς κόμης*, and colloquially twitting an unknown Homeric critic as *ὁ Κύριος οἶδε τίς*. Yet it would obviously be absurd to say that there is no gain derivable from a study of the spoken language of to-day, confessedly brought nearer as it has been in the last forty years to its normal classicalism for literary purposes, whether as regards the ordinary reader and writer or the more curious philological student. It is not a fair view of the case to represent our professed scholars as blind to the advantage of the study of modern Greek as a help to a more thorough understanding of ancient. And fortunately a little translation, with a prefatory note, was lately issued by a Professor of another Scotch University, Professor Jebb of Glasgow, which so judiciously limits and defines the bearings of the question that we cannot doubt our readers will be glad to have their attention drawn to it. It is unnecessary to say that Professor Jebb is no mere worshipper of the dry bones of classical literature, largely versed though he is in classical learning, and eminent as is his fame among English and European scholars; and it scarcely needs to be added that he is not only in theory an accomplished modern Hellenist, but is also well acquainted with the best modern Greek scholars in their own land. In view of the lately founded Hellenic Society, and of the endeavours of the Cambridge classical leaders to encourage a wider study of the archæology of Greek literature and monuments, it is plain that Professor Jebb is not likely to sympathize with an unreasonable opposition to the fullest possible utilization of the spoken language; and it will not be hard to show that his recently published work, without much ado in the way of *ambages et longa exorsa*, goes far to point out what may be done with it, and is even now being done.

From Professor Jebb's "Prefatory Note," as he modestly calls it, we learn that the modern Greek version of the Third Book of Xenophon's *Anabasis*, which he here prints on parallel pages with the original Greek of the famous strategist, was made late in life, by one Constantine Bardalachos (1755-1830), many years an eminent teacher in the Greek schools of Bucharest, Chios, and

---

* *The Anabasis of Xenophon*. Book III. With the Modern Greek Version of Constantine Bardalachos, and a Prefatory Note by R. C. Jebb, M.A., LL.D., Professor of Greek in the University of Glasgow. Glasgow: James Maclehose, Publisher to the University. 1879.

Odessa. It is part of a complete translation of the *Anabasis* and *Cyropædia*, much of which suffered shipwreck with its translator, when in July 1830 he was lost in the voyage from Odessa to Greece, where, after the end of the War of Independence, he purposed to spend the remainder of his days. Through the carelessness of a pilot the vessel was wrecked in fair weather off Cythnos or Thermia, one of the Cyclades; but some of the old man's papers, the Xenophon amongst them, were recovered from the wreck, and in 1845 M. Joannes Doumas, a Greek resident in Odessa, published the translation, at his own cost for free circulation in the Hellenic schools of Greece and Turkey. Professor Jebb owes a copy of it, printed at Athens and now rare, as well as the revision of the sheets of his sample book, printed from it at Glasgow, to Professor Michael Constantinides; and he remarks that the Greek of Bardalachos is substantially that of Koraes, a letter from whom to the future translator, urging him to undertake this very task, and dated 1814, is printed by M. Doumas. It is the third book of this translation, little altered by M. Constantinides, except where here or there a phrase or word might jar on the ear of an educated Greek reader, that Professor Jebb has printed, primarily for his class of some fifty students of modern Greek at the University of Glasgow, with the old and new Greek in parallel columns, and no other grammatical commentary or apparatus save a couple of pages detailing "a few elementary points of difference between Old and Modern Greek." He holds that, though the literary form of the version needs amending in a few details, the language of Bardalachos's translation fairly represents the ordinary current idiom. Can it, then, is the question which his tract suggests, be said unreservedly that Greek ought to be taught as a living language? "If this means that Classical Greek can be taught in such a manner that, by the fact of learning it, the student should be at the same time enabled to write and converse in Modern Greek, I can only say that, for my part, I should regard with great interest any teacher who accomplished so remarkable a feat." He evidently does not believe that aught but confusion could result from an attempt to teach classical Greek as if it were identical with the living idiom of to-day. He as undoubtedly declines to adopt with Professor Blackie the modern pronunciation by accent, which would involve in practice the abandonment of Greek verse composition. But, in another sense, he has no doubt that Greek ought to be taught as a living language; *i.e.* while the student can only pick up differences of vocabulary by practice in reading, writing, and speaking modern Greek, he may have differences of grammar pointed out to him as a student of Old Greek as he goes along. He will not hereby immediately or *ipso facto* learn modern Greek, but will be put in the way of learning it, should he desire to do so; and, what is more, he will strengthen his interest in classical Greek at every step, both by gaining collateral light on special points, and noting curious links and strains of continuity in the history of the language.

Professor Jebb's device for comparing the best form of the modern literary language with the normal classicalism of Xenophon shows, we think, at every point the superiority of the old, and palpably condemns the inartistic structure of the new. By practice in reading off the version of Bardalachos alongside of the original, after noting carefully the two succinct pages of "elementary points of difference," an observant linguist will get acclimatized, and feel himself little more at sea than if he were in Dorsetshire, Lancashire, or Scotland, after a youth spent in cockneyland or a midland county. The differences of the Infinitive, for instance, are not grave, *e.g.* the use of an aorist subjunctive with *νὰ* for *ἵνα*, or an aorist with an indicative after a present; or the alternative use of *τὸ λέγειν*, or *τὸ νὰ λέγῃ τις* in the negative sentence *τὸ λέγειν* (or *τὸ νὰ λέγῃ τις*) *πολλὰ δὲν εἶναι καλόν*. It is a somewhat more roundabout manipulation of the classical future or aorist to substitute for it a circumlocutory concatenation of words in which *θὰ*, the modern abbreviated form of *θέλω*, does duty, one while with the infinitive, at another with the particle *νὰ* and the subjunctive aorist. The modern substitute for perfect and pluperfect makes two verbs necessary where one sufficed in classic Greek; and the imperative seems to launch into needless periphrases when the modern Greek interlards his discourse with such words as *ἄς = ἄφες*, interjected, it would seem, only to weaken and qualify the force of the mood. It takes some time to realize these queer forms of late prescription. As regards the pronouns, it strikes us that in the modern Greek there is a great falling off in distinctiveness, and much more need of recourse to special stress in order to mark various meanings; while it is simply a trial to a cultivated ear to find such prepositions as *ἀπὸ* taking the accusative oftener than the genitive; *διὰ* with the accusative instead of the old dative of part affected; *εἰς* with the acc. for the old *ἐν* with the dative; *μὲ* for *μετὰ*, with acc. in the sense of "with," "together with"; and a commoner use of the prepositions *παρὰ* or *ἀπὸ* to denote comparison than of the genitive case in classic Greek. The first chapter of the revised Bardalachos will suffice to illustrate some salient points of difference between Old and New, and it is needless to go further afield to find evidence that the teacher of Odessa had a fully competent knowledge of his author. If we take up Mr. R. W. Taylor's Third Book of the *Anabasis* (Rivingtons, 1877) we shall see, in c. 1, § 3, that *ἐπὶ τὰ ὅπλα* meant, in Xenophon's language, "the place where the arms were piled"—*i.e.* the headquarters, the place where the evening muster was held. It will be seen, by comparing the new version in c. 1, § 33, with the old, that Bardalachos rightly understands the act of the Greeks in piling arms as identical with assembling at the place of evening muster.

The simple comparison of a single section of c. i. § 26, in old and new will show convincingly how colloquial is the latter, not to say unpolished, unadorned, and circumlocutory. We give the latter, and shall seek to elucidate it by the help of the former. *Ὁ μὲν Ξενοφῶν ταῦτα εἶπε, οἱ δὲ λοχαγοὶ ἀκούσαντες τοὺς λόγους τοῦ, τὸν ἐψήφισαν ὅλοι στρατηγόν των, πλὴν ἦτο Ἀπολλωνίδες τις, ὁμιλῶν ὡς Βοιωτός· οὗτος δὲ εἶπεν, ὅτι φλυαρεῖ ὅστις λέγει ὅτι μὲ ἄλλον τρόπον ἤθελε τύχει σωτηρίαν, παρὰ μὲ τὴν ἄδειαν τοῦ βασιλέως, ἂν εἰμπορεῦῃ νὰ τὴν λάβῃ, καὶ τὸν αὐτὸν καιρὸν ἤρχισε νὰ λέγῃ τὰς δυσκολίας.* No exception is to be taken here to the modern description of the pseudo-Bœotian who turned out to be a Lydian porter, and whom Xenophon designates as "Bœotian-speaking"; but we are launched on a sea of slipshod when, in place of Xenophon's explicit phrase for the unanimous decision of the captains that he should lead, his modern Greek counterpart crowds *τοῦ τὸν τῶν* into the space of six words without regard to euphony or lucidity. In keeping with this we have the conditional sentence *ἤθελε τύχει σωτηρίαν*, and the modern resort of comparison after the adj. *ἄλλος*, *παρὰ μὲ τὴν ἄδειαν τοῦ βασιλέως* with another circumlocution for *εἰ δύναιτο* after it, at a manifest sacrifice of grace and conciseness. For other illustrations of the various resorts of the modern comparative we may cite in § 37, *πλειότερα ἀπὸ τούτους*, "more than these," with which may be paralleled *πλειότερα παρὰ τούτους*, both much commoner with the comparative in general conversation than the genitive simply. Other clumsy colloquial forms of the comparison might be instanced which savour of unclassical surplusage, and suggest the thought, "How happy could I be with either" betwixt the claims of two competing forms. Another section, c. i. § 2, is singularly illustrative of the superiority of the old Greek. The Greeks of the *Anabasis* reflect that *πανταχοῦ ὁλόγυρα τῶν ἦσαν πολλὰ καὶ ἔθνη καὶ πόλεις ἐχθρικαί, τὰ ἀναγκαῖα δὲ οὐδεὶς εἰς τὸ ἑξῆς ἔμελλε νὰ τοὺς προμηθεύσῃ ν' ἀγοράζωσιν.* Not to mention that *ὁλόγυρα τῶν* is surely a quasi-barbarism (we avoid the word "patois"), for the classical phrase means "all round them," it is needless to show how much more direct and explicit is the old Greek *ἀγορὰν δὲ οὐδεὶς ἐτὶ παρέξειν ἔμελλεν* than the roundabout phrase which stands nowadays for, "and no one henceforth would purvey them provisions to purchase"; to say nothing of similar sentences, such as § 18, where Bardalachos's version, which may be translated—"would he not, think you, resort to every form of harsh and dishonourable treatment, so as to inspire all with a dread of ever warring against him," is a very ineffectual representative of the old Greek. We omit to notice such peculiarities of the new Greek as *κανεὶς* and *καθεὶς* for *οὐδεὶς* and *ἕκαστος*; the supererogatory addition of *μου* to *ἑαυτόν*; the reversal in new Greek of the good old rule that "neuters plural have a verb singular," and a good many like peculiar usages. It is reasonable and consistent with common sense to use modern Greek as a light and a clue to the history and philologic study of ancient, but this is about all that can be said, though we are far from auguring ill of the attempts of Hellenists of Athens or Glasgow to revive some of the classical purity of antiquity by teaching the corrupt modern Greek to copy Xenophon. "No one," as Professor Jebb has remarked elsewhere, "who is a stranger to Greek literature has seen how perfect an instrument it is possible for human speech to be." But the comparative tests which we have to thank him for laying before us can scarcely be better instanced than by setting alongside of the unwieldy modern sentence (c. i. § 38) *πρέπει νὰ κάμωμεν πάντα τρόπον νὰ μὴ πέσωμεν εἰς τὰς χεῖρας τῶν βαρβάρων*, so full of repetitions and quasi-tautologies, the neat, handy, self-contained devices of the verbal adjective enshrined in the Xenophontean Greek clause, *πάντα ποιητέα ὡς μήποτε ἐπὶ τοῖς βαρβάροις γενώμεθα.*

FRENCH LITERATURE.

THE second volume of the Memoirs of Mme. de Rémusat (1) yields nothing in point of interest to the first. It covers the years 1805 and 1806, and abounds with curious details. The trial of Moreau and Polignac, the arrival of the Pope in Paris, the coronation of Napoleon and Josephine, the opening of the campaign of Austerlitz, the battle of Trafalgar, the death of Pitt are some of the public incidents which come in for notice. But, as before, it is in its revelations of the inner life of the Imperial household, and especially of the character of Napoleon, that the real value of the book consists. The position of Mme. de Rémusat's husband as Master of the Robes enables her to give most curious particulars about what may be called the tailoring part of the Coronation and other gorgeous ceremonies, in which the Emperor and his new-made grandees took a *parvenu* delight not dissimilar to that of Mr. Tittlebat Titmouse. The volume concludes with a minute description of the economy of the palace, and with some criticisms of the celebrities of the period in literature and art, which fully bear out the compliments paid by Talleyrand and others to Mme. de Rémusat's powers of mind. It is curious that her grandson, in his editorial notes, does much less than justice to these powers, and in particular makes a most unfounded objection to the criticism of Mme. de Staël as "wanting in repose." A better characterization of the perpetual uneasy effort, the stilted grandiosity, and the unceasing "posing" of

(1) *Mémoires de Madame de Rémusat.* Tome second. Paris: Calmann Lévy.

Corinne we do not remember to have seen. The scandalous portion of the book is at least as scandalous as before. The intrigues of Napoleon with more than one lady of his wife's Court, his still more heinous conduct to Stéphanie de Beauharnais at the very time that he was describing her in pompous edicts as his dear daughter, and the general coarseness of his manners and language are represented with no deliberate malice perhaps, but in colours which could hardly be darker.

The Memoirs of Prince Metternich, published simultaneously in English, French, and German, have already received full notice in our columns. The French edition (2) may perhaps be said to deserve the name of original more than either of the others, the most important, if not the greatest, part of the contents having been originally written in the language of diplomacy.

The fifth volume of the new edition of M. Louis Blanc's *Dix ans de l'histoire d'Angleterre* (3) deals with matters so recent and yet so remote that the reading of it has a curious effect. The last struggles of the Confederates, the general election of 1865, the Jamaica business, are points on which almost every Englishman who is old enough to be a bishop held decided, and perhaps vehement, opinions at the time. Other matters, such as the spiritualist performances of the Davenport Brothers; the deaths of Cobden and Palmerston; the *causes célèbres* of Müller and Constance Kent; the Edmunds scandal, and so forth, if they were at no time such burning questions as the others, bring into still sharper contrast the interest that was felt in them then and the antiquarian indifference with which one reads of them now. In M. Louis Blanc's treatment of his subjects his usual characteristics are apparent; very definite standpoints and manners of seeing, joined to an impartiality which is considerable in so decided a partisan, and an accuracy of fact, not indeed irreproachable, but far from common in Frenchmen.

In the splendid series of editions of French classics published under the title of *Les grands écrivains de la France* there has just been issued the first instalment of one of the most extensive of these undertakings. This edition of St.-Simon (4) is thought by its editor likely to extend to at least thirty of the bulky and handsome volumes in which it appears; and, judging from the first two, it will leave little to desire. M. de Boislisle does full justice to M. Chéruel, the first editor of these famous memoirs who deserved the name. This is not the place for any comments on the memoirs themselves. But it is difficult, when one sees the statement that previously to this no fewer than nine editions of this bulky work have been sold in the last fifty years, to avoid comparing the fate of French and English authors in this respect. How many complete editions of our great English classics have appeared in the same time? And how long would French publishers have allowed such a writer as Defoe to remain, as far as a complete edition goes, absolutely unpublished in any form?

Meanwhile M. Chéruel himself is employing his knowledge of the seventeenth century in more original work. The third volume of his history of the minority of Louis XIV. (5) extends from the beginning of 1648 to the beginning of 1650, thus including the earlier period of the Fronde. The strife between the Parliament and Mazarin, the battle of Lens, the Peace of Westphalia, the siege of Paris, fall within this time, and the volume lands us in the very middle of the singular combinations and dissolutions which the private spirit and self-seeking of the princes of the blood brought about, and closes with the *coup d'état* by which Condé, Conti, and Longueville were arrested and imprisoned at Vincennes, in January 1650.

M. Chéruel's history has over M. Baudrillart's (6) the inestimable advantage of dealing with a definite and manageable subject. Without being given to split hairs, we may ask the question what is luxury? M. Baudrillart somewhere says that candles are a luxury, implying that the natural man goes to bed in the dark. From this point of view everything that is not necessary to an arboreal animal with or without pointed ears would appear to be a luxury, and the range of subject then becomes somewhat impossible, including as it does all arts and manufactures from the beginning of time. Short of this little is possible but a more or less cursory essay. This is what M. Baudrillart's book really is; an essay written in a rather rhetorical style, at somewhat undue length, and without that fulness of dates, references, and such like matters which the modern student loves and demands. The present volume extends from the break-up of the Western Empire to the Renaissance, and deals mainly with Europe and (of European countries) chiefly with France. The pictures of Court manners and costumes under the Valois kings are not without interest.

The late M. Cochin's social and economic writings (7) are for the most part purely occasional, and of no great permanent value, but still form an interesting memorial of an earnest philanthropist. Two papers, however, a report on the condition of the working classes in France, read in London at the time of the Exhibition of 1862, and an historical and descriptive essay on the St. Gobain Glass Works, deserve more definite commendation than this, and are likely to be consulted with advantage by inquirers in future. The other essays or lectures are either reviews of books or addresses urging the formation of co-operative societies and savings banks. M. Cochin seems to have been a strong but reasonable Anglomaniac, and he was at the same time actuated by a religious spirit not very common among French men of business. Both these peculiarities are here prominent.

Among volumes of a topographical and descriptive character the palm must be given to some excellently translated sketches of Signor de Amicis, an Italian writer better known by his recent work on Morocco. The style of these sketches of Paris and London (8) is decidedly exuberant, and, like most modern Italian work, highly reminiscent of certain favourite models. The influence of Gautier is very apparent, and in the article on "A Visit to Victor Hugo" it is impossible to avoid thinking now of Théo's first visit to his master, now of Heine's introduction to Goethe. But there is great vivacity and vigour in the essays, and the picture of London, though highly wrought, is far from ineffective. M. Achard's Black Forest sketches (9), of an uncertain date, will not add much to the reputation of that industrious and often successful novelist; and M. Camille Farcy's *Rhin français* (10) is tiresomely full of the spirit of *La revanche*.

Of educational books M. Fleury's "Elementary History of French Literature" (11) deserves first mention. It is a wonderfully compact little volume, giving an immense amount of information in a very small space. The room allotted to modern authors since the Revolution is indeed disproportionate, amounting as it does to nearly half the volume; but M. Fleury probably had to consider the special market—that of Russia—for which he was manufacturing. His excellent book on Rabelais has already acquitted him of any disrespect to the great ages of French literature. M. Pellissier's book (12) is one of those rhetorical manuals which are common in French educational literature, and which account perhaps more than anything else for the superficial and inaccurate character of French culture. M. Pellissier has, he tells us, had in view the exhibition of "the qualities and virtues which are most necessary to our democratic France." The expression gives the keynote of the book, which is a kind of abstract of the history and literature of the ancient world. The useful Pitt Press Series of French authors for schools has received two additions (13), Scribe's *Verre d'eau*, edited, with somewhat too copious notes, by Mr. Colbeck, and the second part of Voltaire's famous *Siècle de Louis XIV.*, by M. Gustave Masson and Mr. Prothero.

Of the three new volumes of the *Bibliothèque de philosophie contemporaine*, the translation of selected passages of Schopenhauer (14) is of most general interest. M. Espinas's review of the present state of experimental philosophy in Italy (15) contains a series of sketches of Italian men of science and letters rather than anything else; and the translated work of Signor Siciliani (16) shows one of these men of science engaged in assimilating, for the benefit of his hearers or readers, the results of more original thinkers.

We can only briefly notice a batch of scientific monographs. M. Bourgault-Ducoudray's lecture (17) discusses a subject almost proverbially obscure and debated. Mrs. Ayrton's contribution to ethnology (18) consists in a record of her application of the late Mr. Bonomi's measuring system to a certain number of Japanese, while the titles of the works of M. Deltour (19) and M. Siouffi (20) sufficiently explain themselves.

The second volume of M. Paul Stapfer's study of Shakspeare (21), completes a work which is of all the more interest because it is written from a point of view different from any commonly taken in England. M. Stapfer is neither a disciple of the Shakspearian minute philosophy which counts letters and words, nor does he regard our poet as an occasion for eloquent rhapsodies or gracefully affected conceits, nor has he given in his adhesion to the recent school of German Shakspeare-haters. The first volume of the work, which appeared some eighteen months ago, dealt chiefly with the origins of the various plays. The second contains a discussion of some points both of tragic and comic handling in Shakspeare,

(21) *Shakspeare et l'antiquité.* Par Paul Stapfer. Tome second. Paris: Sandoz et Fischbacher.

compared in the former case with the Greek tragedians, in the latter with Molière. It will thus be seen that the title *Shakspeare et l'antiquité* must be construed liberally. The merits of M. Stapfer's book are to be found in the absence of prejudice—if we except a somewhat unreasoning adoration of Racine—in wide reading, and in considerable critical acuteness and observation. Its faults lie chiefly in a certain desultoriness and absence of method, in an abuse of quotations, often from quite insignificant authorities, to support positions which the author might generally very well defend with his own forces, and occasionally in a want of thoroughness—as, for instance, in the treatment of the important question of Molière's method of exaggerating particular aspects of character. Perhaps M. Stapfer has had Saint-Mark Girardin's famous *cours* too much before his eyes. But his book has not the less great value and interest for students.

M. Ferdinand Brunetière (22), as a critic, presents to critics an interesting study. He is a neo-classic, or perhaps, as that word is ambiguous, we may be permitted to call him a neotato-classic. Since 1830 there have been various attempts to reverse the work of that great epoch, and to throw out of fashion the catholic and comprehensive study of all periods of French literature which it introduced. M. Brunetière belongs to the very straitest sect of these reactionaries. This sect is not contented with abjuring M. Victor Hugo and all his works. It is not enough for them to regard the great writers of the sixteenth century as at best well-intentioned pioneers who saw but afar off the Promised Land. To them Corneille is an athletic barbarian, and Voltaire a rickety *petit maître* of the Decadence. Beyond the school of Louis XIV. there is no literary salvation in their eyes, and even then they are like the old Scotchwoman, "no that sure" of anybody besides Racine and Boileau. The essays, most of them reprinted from the *Revue des Deux Mondes*, which M. Brunetière here publishes, are admirable specimens of this curious pedantry. The first of them is entitled "Littérature française du Moyen-Age," and consists chiefly of an attempt to prove that there is no such thing. M. Brunetière is indignant with the people who republish, praise, and pretend to relish *chansons de geste, fabliaux, pastourelles*, and mysteries. According to him, their admiration is mere affectation. No rational person who knows Rabelais and La Fontaine can care to read a *fabliau*; no rational person, shall we say, who can read the Namur Ode can care to read *Roland* or *Aliscans*. The only excuse that we can make for M. Brunetière is that, to do him justice, he does not seem to have read the literature he condemns. He ingenuously confesses that as long as *Roland* was *non traduite* the claims made on its behalf might have been allowed. In another essay on Racine a somewhat similar suspicion is excited. M. Brunetière would have us think that, so far from Racine being merely an improver of Corneille, as his admirers have hitherto contended, it was Racine and not Corneille who was the second founder of French tragedy. "Corneille," says he, "has nothing more than Rotrou Mairet and Du Ryer, except greater genius." We are bound to say that, to any one who has read the authors in question, this is ample and sufficient proof that M. Brunetière has not, unless perhaps he has opened *Venceslas* and *St. Genest*, forgetting that Rotrou did not write these till long after Corneille's masterpieces. In short, we fear that we must deny either M. Brunetière's judgment or his knowledge of the facts. Of course slips of this kind do not decide the question against the neo-classics, but it is unfortunate and remarkable that they are generally to be discovered in their arguments.

It may seem a bold thing of any Frenchman to attempt a translation of *Elia*. M. Dépret (23) has adopted the plan of strictly literal translation, and the effect is better than might have been expected. But the truth is that an English critic, reading such well-known work as Lamb's, naturally and unconsciously reads it in English with his mind, though the French words may be before his eyes. The translator has prefixed a long introduction on Lamb, on humour, and on things in general, which is more destitute of method and composition than is usual with Frenchmen of letters. He is constantly digressing; it is often difficult to make out in what particular galley he is for the moment sailing, and still more difficult to make out what business he has there. His critical dicta again are not happy, as may be judged from his dismissal of Thackeray as *âpre et triste*, and from the fact that he cannot find in *Gulliver*, in *Tom Jones*, or in *The Vicar of Wakefield* any of the moral character upon which Thackeray himself insists.

M. Lemerre's *Petite Bibliothèque Littéraire* has received two accessions. One is the thirteenth volume of the new edition of François Victor Hugo's translation of Shakespeare (24) containing *Timon of Athens* and *Coriolanus*. The other is the third volume of the *Heptaméron* (25), perhaps the most characteristic after Rabelais of all the literary monuments of the French Renaissance.

Two slight but pleasant works of M. Coppée have been recently published. The first is an edition of the little poem of *Bleuette* (26), sumptuously printed in the blue ink which has recently become fashionable with Parisian publishers of choice editions, and illustrated by M. Henri Pille. The poem is a fairy story, written in flowing and elegant verse. The illustrations do not contrast at all favourably with the somewhat similar work to which Mr. Caldecott and some other artists are accustoming English children. *Le Trésor* (27) is from a literary point of view more ambitious, though even in this case M. Coppée has not attempted a *magnum opus*. It is a comedy, or rather a comedietta, written in orthodox Alexandrines, but containing only three personages—the Duke Jean, a reduced noble of the days of the Consulate, the family confessor, and his niece, Véronique, a young lady of what would be called in France *candeur adorable*. A faithless damsel of high rank looms in the distance, and the recovery of a family treasure (which is no treasure) supplies the simple plot of the play. Instead of the diamonds expected, and as it seems found by Véronique, it is discovered that a heroic ancestor, after selling them to meet the necessities of Henri IV., has substituted imitations, and the real *trésor* which comes to his descendant is of course Véronique. The Abbé, who has nineteen tragedies all copied out in full, is rather a pleasant personage, and the piece breathes the air of somewhat calculated simplicity and artificial nature which M. Coppée knows well how to give, and which has made his work popular.

The novels of the month are few and unimportant. *Linda* (28) is a dull and commonplace story of the intrigues of a villain with Judas-coloured hair. *Un Bâtard légitime* (29) approaches the manner of Balzac's less successful work, and deals with the peculiar class of speculators and officials of the First Empire which Balzac loved, but has also some of the features of the novel of adventure. Henry Morel's work (30) attains a much higher literary level than either of these, but it is too painful and disagreeable in subject to obtain or deserve popularity in England. It is a laborious history of the sufferings of a young girl who is guiltless (or all but guiltless), though generally sinned against, and the author has evidently endeavoured to be scrupulously realistic. M. de Queux de St. Hilaire's translation (31) is much the pleasantest of the four. It recounts the escape of a young Greek and his family from the Scio massacres, and is said to be founded on fact. A certain absence of sufficient material is all that can be urged against it.

Two important periodicals of a specialist character have begun with the year 1880. The *Revue égyptologique* (32) appeals to a limited but earnest class of students. It contains a lengthy and unfinished article on the chronology of the Ptolemies by M. Revillout, a philological discussion by Brugsch Bey, and a geographical paper on Lake Mareotis by the same accomplished *savant*. *Le Livre* (33) addresses itself to a wider audience. It is started (under the editorship of M. Octave Uzanne), as a receptacle, in the first place, for bibliographical papers; in the second, for articles on the literary movement in all European countries. The first number is full of interesting matter, though it would perhaps be unfair to expect that it should be perfect. But if the editor wishes it to circulate in England, we should recommend him not in future to insert, under the title of "Bibliography in England," articles on privately printed catalogues of obscene books which have no right whatever to the title of literature. This objectionable article is distinct from the monthly *Chronique* on English literature, which has been entrusted to the capable hands of Mr. Arthur O'Shaughhessy. Mr. O'Shaughnessy's work is of course not intended for his fellow-countrymen, but for foreigners. He has, however, done some injustice to the former in representing himself as *presque seul* in a knowledge of MM. Leconte de Lisle, de Banville, and so forth. And we must say that, in speaking of the *style charmant* of *Theophrastus Such*, he is playing his French readers something of an unkind trick. The publication is very handsomely printed, contains some interesting articles, and must be regarded as indispensable to the bibliomaniac.

HERAT.

THE vague language lately used by Lord BEACONSFIELD with respect to the future settlement of Afghanistan has received an unexpected interpretation. The *Times* of Tuesday last contained a statement, evidently derived from some official source, that the Persian Government was to be released from the obligation of abstaining from the assertion of its ancient pretensions to the sovereignty of Herat. The renunciation was the consequence, as it had been the main object, of the Persian war of 1856. Sir JAMES OUTRAM'S victory had convinced the Persians of the inutility of further resistance; and for nearly a quarter of a century the Afghans have retained undisputed possession of the most important city and territory of Central Asia. When a few years ago a dispute arose between Persia and Afghanistan as to the province of Seistan, no question was raised with respect to the sovereignty of Herat. Although the provincial capitals have been jealous of the supremacy of Cabul, SHERE ALI, when he had finally established his claim to the inheritance of DOST MAHOMMED, was represented by a Governor of his own nomination at Herat. Even during the short and troubled interval between the conclusion of the Treaty of Gundamuk and the renewal of the war, AYOUB KHAN, who is still the nominal ruler of Herat, professed loyalty to his brother the AMEER. According to doubtful and imperfectly intelligible rumours, Herat has for some months past been subject to disturbances which almost attained the dimensions of civil war. Regiments from Cabul and indigenous troops have sometimes engaged in actual conflict, with results which are not fully known. Sometimes it was stated that AYOUB KHAN proposed to advance at the head of an army to Candahar; but, if any such purpose was entertained, it was apparently baffled by the mutinous disposition of the soldiery. Statements that Russian agents were busy at Herat, though not improbable, have been founded on mere conjecture; and those of the inhabitants who are said to wish for the annexation of the city and province by England may not perhaps be the dominant party.

The solicitude which has been felt as to Russian designs upon Merv has related exclusively to Herat. Merv itself is a fortified collection of huts, perhaps only periodically inhabited, in an oasis of considerable extent. The Russians, if they possessed Merv, would probably make it the site of a fort, with a garrison sufficient to control the Turcoman nomads in the neighbourhood. The military and political importance of the place consists almost wholly in the basis which it affords for an expedition against Herat. It is true that Russian writers have lately affected to prefer the route of Bokhara, perhaps with the object of diverting attention from Merv. The English Government has never relaxed the vigilance with which Russian movements in the direction of Merv have been watched. On more than one occasion inquiries have been made as to the ultimate purpose of the expedition which is intended to retrieve the failure of last year, and to reduce the Teke Turcomans to submission. Count SCHOUVALOFF assured Lord SALISBURY that it was intended to establish a frontier line considerably to the north of Merv; and similar declarations were made to Lord DUFFERIN by M. DE GIERS, by Baron JOMINI, and by the EMPEROR himself. It is right to admit that none of the communications amounted to promises; so that the Russian Government could not be charged with bad faith if General KAUFMANN took possession of Merv. M. DE GIERS remonstrated against a statement made by the Government to the House of Commons on the ground that it seemed to imply a definite engagement; but he afterwards repeated to Lord DUFFERIN the statement that the intentions expressed by the EMPEROR had not since been modified. The Russian journals have uniformly assumed that Merv was the object of the expedition, and some of them have complacently expatiated on the facilities which the place will afford for an early advance on Herat and an ultimate invasion of India. It was hardly worth while to protest against the conquest of Merv, if entirely new arrangements were to be made as to the sovereignty of Herat.

The formal answers given by Lord BEACONSFIELD and Sir STAFFORD NORTHCOTE to the leaders of the Opposition virtually confirm the statement in the *Times*. There is no longer any doubt that negotiations for the transfer of Herat from Afghanistan to Persia are in progress, and in such matters, as in the question of Home Rule, inquiry implies a preconceived determination. Oriental diplomacy, however obstinate or tortuous, will place no impediment in the way of a coveted acquisition. Persia will assent to any conditions which may be proposed in preference to breaking off a profitable bargain. It will be interesting to learn whether any Afghan negotiator has taken part in a discussion which concerns his countrymen in the first degree. There is no doubt that the Ameer of CABUL was intended to be a trustee for England in defending Herat from foreign aggression; but it can scarcely be denied that he and the nation which he represented had also beneficial interests of their own. In time of war it may perhaps be allowable to dismember an enemy's territory; but it is not perfectly clear that England is at present at war with the Afghan people. The version of the story which was published in the *Times* cannot be complete, although it may be accurate as far as it goes. It is inconceivable that the Government should simply cancel the agreement of 1856, leaving Persia to choose a convenient time for taking Herat by force from its present possessors. A treaty which could only be enforced by a war between two foreign Powers would be equally anomalous and unjustifiable. If England has really undertaken to convey Herat to Persia, some means of accomplishing the transfer must have been provided; yet it would be a strange and hazardous proceeding to undertake a siege of Herat for the purpose of afterwards handing the place over to a claimant whose title has hitherto been consistently disputed by England.

There is yet a fourth party to the negotiation, who may perhaps be found to be the author of the whole combination. The proposal of a transfer of Herat to Persia originated with Russia. Again and again, within a few months, official and semi-official journals have dwelt on the expediency of a friendly understanding between Russia and England, to be cemented by the arrangement which now seems to approach completion. The motives of Russia are more intelligible than the considerations of expediency which may have weighed with the English Government. Although Persia has of late been supposed to incline to the English alliance, no reliance can be placed on a weak Power which has again and again made itself the instrument of Russian policy. A generation ago Herat was defended from a Persian invasion, on the ground that, if it were taken, it might become a Russian possession or dependency. It is possible that, if the transfer is effected

with the consent and indeed at the instance of Russia, the sovereignty of Persia may for the present be nominally respected; but there can be no security against a future conquest or cession. It will also be found that an immediate price must be paid for the consent of Russia. A part of the price of Herat will be paid by Persia in the form of a surrender of so much territory on the southern bank of the Attrek as may enable Russian troops to turn the flank of the Turcomans and to avoid a laborious march through the desert.

The Turcomans have no claim on England as friends or allies; but, on the other hand, they have given no provocation which would justify the conclusion of a treaty hostile to their interests. It may not be possible to apply to Asiatic States the extremely elastic rules of European international law; but the disposal by Great Powers of the territories of their neighbours with exclusive regard to their own convenience resembles too nearly the habitual policy of NAPOLEON at a time when public law had almost ceased to exist. It is probable that the first impression produced by the account of the negotiations may be modified by the explanations which the Government is at present compelled to reserve. If an amicable understanding has been established with Russia, an additional reason will have been furnished for the refusal of the Government to publish the Russian correspondence found at Cabul. It is useless to guess at the Duke of ARGYLL'S reasons for pressing for the publication; and he will have an opportunity of explaining his own conduct. For the present there is, as always, a strong presumption against any measure which tends to produce irritation without yielding any substantial result. The statements of the late Ameer YAKOOB KHAN to General ROBERTS are only historically important as they confirm the belief that SHERE ALI was first alienated from the English alliance in 1873. The two volumes of despatches lately issued contain but little new information. The suspicion that ABDURRAHMAN was deliberately released is fully confirmed; and it appears that at one time his destination was Herat. As his arrival in the city has not been reported, he may perhaps have been restrained by superior orders, until the supposed negotiation with England had either failed or succeeded.

ENGLISH ELECTIONS AND HOME RULE.

THE Conservative victory at Liverpool has afforded a legitimate triumph to the winning party. The Liberals were trying to get a Conservative seat, and they offered to show that their incessant denunciations of the Ministry had been so effectual and convincing that a very important constituency had been converted, and would prefer an adversary to a supporter of an erring Government. They did succeed in polling a very large number of voters, a number exceeding that by which the Conservatives had at former elections seated their members. But the Conservatives outdid them, and by a majority of more than two thousand proved that Liverpool was not converted. This may fairly be described as a test election. The whole conduct and policy of the Ministry was under review, and one of the leading towns of England manifested approval of the policy of the Ministry. The election was also a test election in another sense, for it raised in a distinctive form the question of the relation of English parties to Home Rule. It showed that a Liberal candidate, although bidding just high enough to catch the Irish vote, can still command the general support of the local Liberal party; and it also showed that the mere fact of the Irish vote having been caught stimulates voters who might otherwise be indifferent to show their resentment at Irish dictation. But, with a general election so near, elections even in places much less important than Liverpool show something of the feelings of constituencies generally, and are, after their fashion, test elections. The Barnstaple election shows that in a quiet West of England town where Home Rule is a subject very far from the ordinary thoughts of men, and a contest is fought out on the old-fashioned party lines, the Liberals have been able to maintain the advantage they gained six years ago, and to secure the whole of a representation which they used to share with the Conservatives. The policy of the Government has not been bad enough to convert Liverpool, nor good enough to convert Barnstaple. The Southwark election may also claim to be considered a test election. A Conservative is being opposed by two Liberals. If only one Liberal was standing, and his party heartily supported him, he would probably win. If the Liberal party is divided or sulks, a Conservative may probably get in. The contest has thus become a contest inside the Liberal party, and the rival Liberals oppose each other much more fiercely and openly than either section opposes their common enemy. One section insists on the treason to the party generally which is involved in dividing it. The other insists on its right to have a man exactly after its own heart. Home Rule only enters into the contest in so far as it provokes the question whether it or anything else shall be allowed to divide the Liberal party. So many seats were lost to Conservatives at the last election through the divisions of the Liberal party, that, from a mere electioneering point of view, considerable interest attaches to a contest which may serve to show whether the feeling in the Liberal party that it must not waste its strength is sufficiently powerful to override its perennial impulses to division.

The questions raised by the Liverpool election as to Home Rule were taken up in Parliament immediately on its reassembling. Lord BEACONSFIELD opened the Session by expressing his latest views on Home Rule; and Lord HARTINGTON was questioned as to the part he had taken in supporting Lord RAMSAY. Lord BEACONSFIELD laid down two propositions, which are perhaps true in a remote and inferential sense, but which are open to the charge of unstatesmanlike exaggeration if taken literally. The first proposition was that it was the same thing to talk of Home Rule in Ireland as to talk of Home Rule in Yorkshire. It is contrary to the plainest facts, past and present, to speak as if Ireland were related to England exactly as Yorkshire is related to the rest of England. Ireland is not, and never has been, on the footing of an English county. It has had to be conquered over and over again. It has had a Parliament of its own, and has managed to convince England that it cannot be allowed to have such a Parliament any more. It still has a Peerage of its own, and a Court of its own. It is not allowed to have the English suffrage, or to raise Volunteers. The Established Church has been disestablished, and it has had a Land Act given it which is supposed to be exceptionally adapted to its peculiar needs. It is quite statesmanlike to say that, in spite of these things, Ireland cannot have a new Irish Parliament; but it is not statesmanlike to affect to ignore peculiarities in the situation of Ireland which every one knows to exist. The proposition that every one who supports Home Rule is false to his QUEEN and country evidently reflects nothing more than Lord BEACONSFIELD'S feelings at the moment. It cannot possibly have been consistent with his duty to the Crown to appoint as special representative of the QUEEN in an Irish county a man whom the Minister appointing him thought false to the QUEEN. Lord HARTINGTON had a very different task to fulfil from that of anathematizing Home Rulers. He had to defend himself, not to attack others. He had to explain how it happened that he supported Lord RAMSAY. He frankly acknowledged that he could not have supported Lord RAMSAY if Lord RAMSAY had declared that he would join in asking for an Irish Parliament; but he said that all Lord RAMSAY had done was to promise to join in promoting a formal inquiry whether an Irish Parliament is possible or desirable. This Lord HARTINGTON thought was not enough to alienate him from a candidate who in every other respect was most satisfactory to him. It is extremely undesirable that the lines of party should be made too rigid; but when it is said that Home Rule means something very bad, while an inquiry into the desirability of Home Rule means scarcely anything, we must ask what such an inquiry really does mean; and we cannot find in Lord RAMSAY'S letter justifying his alliance with the Home Rulers any trace of his having given any attention to this very important point.

The simplest way of looking at Home Rule is to regard it as a demand that the Irish shall be placed towards England in the same position as the Canadians. Many other objections to this demand might be urged; but there is one objection to it which is fundamental and sufficient in itself. The Irish could not be in the same position to England as Canadians are. The bases of our relations with Canada are, that in the last resort we can afford to let Canada go, and that we have a reasonable expectation that the Canadians will not

come into collision with the Imperial Parliament. Neither of these bases exists in regard to Ireland. We cannot afford to let Ireland go. We cannot hazard our position in Europe by having a hostile independent little State at our very doors. We have not merely a reasonable expectation, but a full assurance, that the Irish would come into collision with the Imperial Parliament. They are as unfit as any nation could be for a separate representative government. Their leaders spend their time in showing, not how Parliamentary work can be carried on, but how it may be stopped altogether. They themselves are the victims of agitators or the tools of priests. They have scarcely any notion of obeying the law, and regard assassination as a smart national habit. Their dreams are dreams of confiscation and communism. Unless the Imperial power was present to restrain and control, Irish society would break up into anarchy. It is not right that any set of rulers should allow any of those they govern to bring on themselves so much misery as the Irish would bring on themselves if they had not England to keep them in order. But, apart from considerations of humanity, the Irish Parliament would be sure to come into collision with the Imperial Parliament. Things which the Irish Parliament wished for would be vetoed by England, and then this veto would be a new grievance. Sooner or later, and probably before long, this difference would lead to resistance, and then England would have to use force. The logical end of Home Rule is the reconquest of Ireland. An inquiry into the desirableness of Home Rule really means an inquiry into the desirableness of having to reconquer Ireland. How is it possible that such an inquiry should be conducted? An inquiry into Home Rule is useless unless it includes an inquiry into the objections to Home Rule. Either the inquiry would be a mockery, or it would drive the Irish wild. The only justification English candidates have for promising to vote for such an inquiry is that they secretly feel sure that what they are to vote for will never be carried. This is a very poor justification; and they had better face the unpleasant thought what the inquiry they are to vote for really means before they engage to vote for it.

THE DEBATE ON IRISH DISTRESS.

THE objections to the course adopted by Mr. SHAW in moving his amendment on the Report of the Address were as technical as his own reasons for anticipating the debate on the Government Bill were conventional or simply rhetorical. The discussion itself was both proper and inevitable; and the time and occasion for beginning it mattered little. It would perhaps have been more logical to wait for the Bill for enlarging the powers of the Government, especially as the part of the measure which is retrospective raises the whole question of the policy which has been followed to the present time; but there is no need of haste in granting an indemnity which cannot be withheld. If some hours were wasted by Mr. SHAW's refusal to proceed on the first night of the Session, and if the adjournment of the debate on Monday was unnecessary, it cannot be said that the conduct of the Irish members thus far can be rightly described as obstructive. No other question of equal importance requires the attention of Parliament; and it was right that the serious nature of the existing distress should be fully explained. Mr. SHAW, Mr. MITCHELL HENRY, Mr. BLENNERHASSET, and several other members, may be acquitted of any desire to prefer political or party interests to the object of averting famine. Mr. O'DONNELL and a few like-minded associates are responsible for the spiteful and factious extravagance of the invective against the Government which he thought fit to embody in an Amendment. Mr. O'DONNELL did his best to provide an excuse for any disinclination which Parliament might be supposed to feel for considering the charges of agitators who do their best to render government impossible in Ireland. It is a monstrous and insolent falsehood that the petitions of starving cultivators have been answered by arbitrary arrests and displays of military force. An Irish patriot must care but little for the distress of his countrymen when he diverges into idle rant about abuses committed by Ministers which are said to be more dangerous than open treason to the State. Mr. O'SHAUGHNESSY drew a more practical conclusion from the negligence which, like his colleagues, he imputed to the Government. His proposal that, as a penalty, the whole cost of relief should be charged to the Imperial Treasury had the merit of simplicity and boldness.

The proposal of a vote of censure did the Government the service of procuring an almost unanimous acquittal by all sections of the House of Commons, with the exception of the party of Home Rule and the extreme Radical section. It was improbable that any Government should at the same time neglect its duty and sacrifice its own credit by refusing to aid a considerable part of the population which was exposed to severe suffering and imminent danger. There were many concurrent causes of distress, such as the low price of agricultural produce and the refusal of shopkeepers and money-lenders to give further credit; but the greatest of all evils were the deficiency of dry turf and the failure of the potato crop. It was stated in the course of the debate that the crop was short of the average to the value of several millions sterling; and, in default of external relief, the deficiency would be prolonged into future seasons by the unavoidable consumption of seed-potatoes for food. There can be little doubt that, whatever had been done or omitted, the Government would have been blamed. On the other hand, it is not to be assumed that mistakes may not have been committed. At the beginning of September the Irish Local Government Board directed the Inspectors to inquire into the state of the potato crop and on the supply of fuel; and the reports were sent to the Board in the middle of October. It would probably have been impossible to form a judgment of the condition of the crop earlier in the season. The Inspectors were also instructed to ascertain whether there was likely to be an increased demand for Poor-Law relief during the winter. It was already known that indoor or outdoor relief had been given to 7,000 or 8,000 persons in excess of the numbers of the previous year. The official reports confirmed on all points the apprehensions of the Local Government Board. On the 28th of October they accordingly addressed the Irish Government, with which they had probably been already in communication; and an application was made to the Treasury for a relaxation of the terms on which money is advanced to landlords for purposes of improvement.

The Local Government Board at the same time desired the Board of Guardians to take care that the unoccupied wards in the workhouses should at once be cleaned and whitewashed, and placed in every respect in good and habitable order. One of the speakers in the debate declaimed against the alleged inhumanity of the Government in taking measures which pointed to the administration of indoor relief. Under the provisions of the Irish Poor Law, no person can be admitted to the workhouse while he occupies land beyond the extent of a small garden. Small farmers will consequently submit to almost any hardship in preference to resorting to the workhouse. It was insinuated that the Local Government Board desired either to leave the people to starve or to evict them from their holdings. The indignant critic omitted to read the next paragraph of the circular by which the Guardians are directed to take care that the relieving officers may be ready to discharge their duty efficiently "should the condition of the poorer classes render it necessary to afford "relief out of the workhouse more freely than at present." The risk of injustice to occupiers of land had not been overlooked, while precautions were taken against the sufferings to inmates which might have resulted from any unusual crowding in workhouses. The very poorest of the people are not occupiers, but labourers; and it is better that they should be kept alive in the workhouse than that they should be left to starve. At a later time the rules which limit outdoor relief were suspended in cases where the Inspectors thought relaxation necessary; and the Government is not to blame for postponing as long as possible measures which, even when they are necessary, must tend to diminish self-reliance and to encourage pauperism. The exact moment of interference with the ordinary course of law and practice must necessarily be left to the discretion of the responsible authorities; and those who sincerely wish that their duties should be efficiently discharged will place a candid and generous construction on their acts. The person who has to do a thing is more likely to do it well than a hostile critic to be right in condemnation of his conduct. The Government might, as the result has

shown, have judiciously offered at an earlier period the liberal terms which have induced landlords to borrow considerable sums for improvement. The proposal that loans should be made to occupiers as well as to owners is wholly inadmissible. A loan on insufficient security is, as private lenders well know, a gift in all respects, except that it is not rewarded by gratitude.

The CHANCELLOR of the EXCHEQUER informed the House of Commons that the Government had satisfied itself that food and seed potatoes could, if necessary, be despatched without delay into the distressed districts. It was therefore thought unnecessary to accumulate stores of provisions; and his own announcement had been deliberately delayed. The trade supply would be instantly checked if it were known that Government competition was to be feared. The experience acquired on a large scale in India has thrown much light on the difficulties which beset the relief of widespread distress by the most intelligent and beneficent Government. During the great famine in Bengal Lord NORTHBROOK was justified by the result in refusing, against the strong opinion of Sir GEORGE CAMPBELL, then Lieutenant-Governor, to prohibit the exportation of grain. Artificial disturbance of prices would have done more harm by discouraging production than any scarcity which could be attributed to the drain caused by foreign demand. On the whole, no sufficient argument was produced in favour of the practical part of the Amendment. Those who would have taken the place of the Ministers if the vote of censure had been carried declined to pledge themselves to a more lavish expenditure. Mr. SHAW himself can have attached little importance to the proposition that the tenure of land was the cause of the distress. Laws which have existed in good as well as in bad times must be compatible with prosperity; and it is obvious that no change which could now be made would affect the present distress. Recriminations as to patronage of Home Rule at Liverpool or in Sligo were entirely irrelevant to the question, though they perhaps formed the most exciting portion of the debate. Lord HARTINGTON virtually approved the measures of the Government as to turf and seed-potatoes; and he had a right to amuse himself by drawing nice distinctions between his own opinions and Lord RAMSAY'S.

M. DE FREYCINET AND THE AMNESTY.

M. DE FREYCINET has made a speech the reception of which supplies a curious commentary on the esteem in which Ministries have lately come to be held in France. He has actually put his foot down—put it down indeed in the mildest and most provisional way, but still put it down—and the Chamber of Deputies seems to have been reduced to speechlessness by the spectacle of so much determination. His oratorical triumph, the *Times* Correspondent informs us, was "surpassed by the moral "triumph of the honest patriot and statesman." The Left, we are further assured, "evidently felt a pleasure in "at length rallying round a chief capable of leading it to "battle." It is with extreme curiosity that we turn to the text of the speech which has earned such exceptional praise. A throng of spectators, the same authority informs us, was waiting to hear whether a French Premier would at last give a fitting answer to the restless agitators who demand a plenary amnesty. And this is what the spectators heard. "The Government," says M. DE FREYCINET, "altogether reject this proposal for a "plenary amnesty." Here, then, France had at last an unmistakable declaration on the part of the Cabinet. Perhaps, when M. DE FREYCINET had spoken his second sentence, France did not feel quite so confident. The Government "will not pledge themselves as to the future "either one way or the other." Surely a foot was never put down with so little determination. You shall not have a plenary amnesty, says this resolute and daring statesman; and then, remembering the relation that ought to exist between valour and discretion, he adds, At least, you shall not have it to-day. It would have been hard upon the advocates of a plenary amnesty to have left them in this uncertainty as to what the morrow might bring forth; so M. DE FREYCINET kindly went on to lay down the conditions under which a plenary amnesty may be granted. First, the amnesty must have ceased to be a matter of agitation out of doors; next, it must have ceased inside the Chamber to wear the appearance of opposition to the Government. An amnesty can only be given when the Government possesses "the moral strength derived "from stability and durability." Plainly, therefore, it is the business of the advocates of an amnesty to help on the realization of this condition. If they want a result that can only be had from a stable Government, let them set to work to make the Government stable. As it is, they are doing nothing of the kind. Instead of trying to give stability to the Government, they systematically withhold their votes from it. "If they sincerely wish to make the "amnesty practicable, let them strengthen the Republican "party by supporting the Government." If they help the Cabinet to carry all the measures it has in hand, then —in a France tranquil and prosperous by reason of its railways, its canals, and its schools—a strong Government may say that the time has come for a complete amnesty to be proclaimed.

The *Times'* Correspondent is full of admiration at the Parliamentary strategy which M. DE FREYCINET'S speech displayed. No doubt if the plan succeeds, it will have a fair claim to be called clever; but it is permissible to doubt whether the snare is not spread too completely in sight of the bird. In the first place, M. DE FREYCINET has completely abandoned the position originally taken by the opponents of the plenary amnesty. He no longer rests his refusal on the exceptional character of the crimes for which the amnesty is demanded. The burning of Paris and the murder of the hostages are not now treated as unpardonable sins. On the contrary, they are sins which it will be proper to pardon by and by, when the Government has been victorious in a certain number of divisions. How many of these triumphs will M. DE FREYCINET think it necessary to reckon up before he regards his Cabinet as sufficiently strong to grant what is asked of it? Judging from similar cases, it may be expected that the very argument which is now used to postpone an amnesty will shortly be used to hurry one on. If there is a necessary connexion between an amnesty and a strong Government, M. DE FREYCINET may soon find it convenient to grant the amnesty in order to create a belief that his Government is strong. No Minister can go on for ever proclaiming his own weakness, and calling upon his lukewarm friends to show their consistency by making him stronger. In the end he will be forced to persuade the country that strength has come by acting as though it had come. Whenever this necessity arises—and it will be strange if it does not soon make its appearance—M. DE FREYCINET will have no choice left him as to the way in which he must act to make the country believe that he is strong. He has proclaimed the symptoms beforehand. When France is tranquil and prosperous, and the Government stable and lasting, the amnesty may be granted. So long, therefore, as the amnesty remains unconceded, France is not tranquil or prosperous, and the Government is not stable or lasting. It is very well for a Minister to say this of his Cabinet and his country when he is fresh in office. He is not then responsible for the absence of these desirable characteristics. But will M. DE FREYCINET venture to say the same thing eighteen months hence? When the elections are next held will he venture to say to the constituencies, I have been Minister for nearly two years, and I have not made either my country or my Cabinet what I wish to see them. I wished France to be tranquil and prosperous; she is neither. I wished my Government to be stable and durable; it is neither. M. DE FREYCINET will be a man of very remarkable courage if he does say this, and if he does not say it, how will he resist the demands for an amnesty? If things have turned out as he wished, why should the concession be delayed? If they have not turned out as he wished, why should he be any longer retained as Minister?

It will be surprising, however, if things are left to go on without further disturbance as long as this. M. DE FREYCINET frankly acknowledges that the Government cannot attain to stability unless it can obtain the entire support of the Left, and in order to get this support, it holds out the amnesty by way of a bribe. If you will vote with me, he says to the advocates of a plenary amnesty, I will see whether I cannot let your friends come back to France. It seems far from unlikely that the Left, having their strength thus openly admitted, will not be long before they give the Cabinet the choice between paying for their support on delivery, or making way for a Cabinet which is willing to do so. The minority in favour of the

amnesty has steadily increased, and though 115 is not a large vote, it is a vote which may greatly embarrass the Government if it is given against it at a critical moment. What the Left will probably say to M. DE FREYCINET will be something to this effect. If you concede the amnesty we will support you in the Chambers, and thereby give you the strength, and France the tranquillity, which you have specified as the conditions under which an amnesty may be granted. In order to enable you to say that these conditions have already been obtained, we will even vote with you in two or three divisions before we raise the amnesty question for the last time. If, on the other hand, you do not concede the amnesty, we shall take the earliest opportunity of upsetting your Government. We shall easily find some occasion on which we can patch up a momentary alliance with the Right, which, though from different motives, is as anxious as we are to see a genuinely Radical Cabinet in office. If M. DE FREYCINET turns a deaf ear to these solicitations, he is not likely to retain power long. If he yields to them, it will not be long before the plenary amnesty is granted.

As regards the absence of agitation out of doors, there is a particular kind of agitation which it seems safe to say will, supposing it to be resorted to, hasten the grant of an amnesty rather than delay it. Whether the Communists who have been condemned in their absence will carry out the design attributed to them and come back to France is, perhaps, doubtful. A man may not like to put his head in a noose, even though he knows that the chances are infinitely against its being drawn tight. But, supposing they do come back, it seems morally certain that the plenary amnesty cannot long be withheld. If no notice is taken of them, they will practically have amnestied themselves. If they are arrested, and tried, an agitation of a new and highly embarrassing kind will at once begin. There was much that accompanied the suppression of the Commune that a French Government will not care to have paraded in the full light of day nine years later, and the counsel for the defence will be perfectly well aware of this. As the Government will not be able to silence the advocate, they will probably think it wise to pardon the client.

EGYPT.

THE documents contained in the French Yellow-book on Egypt, taken in conjunction with a very interesting and able article by Mr. DICEY in the current number of the *Nineteenth Century*, enable English readers to form a fuller and juster notion of the present state of things in Egypt than has hitherto been possible. It is by examining the circumstances under which the strange institution of a joint Protectorate has been established that we can best understand what this Protectorate really means. Every one knows who knows anything of Egypt that TEWFIK is Viceroy in place of his father ISMAIL, that there is a native Ministry with RIAZ PASHA at its head, that MM. BARING and DE BLIGNIÈRES are the Controllers who keep everything in order, that the Egyptian Government has recently made a proposal for the settlement of its debt which has met with the general acceptance of the public, and that the question of the Domain Loan has been settled by a compromise. A document contained in the French Yellow-book gives in detail a statement of the powers and functions assigned to the Controllers. They do not nominally govern, but they supervise the whole government of the country. They attend at the Councils of Ministers, and vote in those Councils if they please. Every functionary from the highest to the lowest has to give them every information they may require. They act in conjunction with the Commissioners of the Public Debt whenever they please. They have a staff of their own whom they appoint and dismiss, and whose pay they fix, and they are irremovable except with the consent of the Governments appointing them. Since their arrival in Egypt, scarcely three months since, they, and the system they work, have given great satisfaction. Egypt is, for the moment at least, flourishing. The crops have been excellent, the new VICEROY has given no trouble, the old Viceroy has abandoned his hopes of a restoration, the fellahs have been allowed a respite from extortion; the Controllers themselves are recognized as men of unusual ability and honesty; they are warmly supported by their Governments; and few, if any, obstacles are thrown by other Powers in the way of England and France. All this is encouraging and pleasant to hear. But, even when we have heard it all, we may feel that we do not yet know what are the bases of the Protectorate, and what is the real relation of Egypt to France and England. An examination of the French Yellow-book and of the information which Mr. DICEY furnishes will, we think, supply the answer. The secrets—if such a term may be used—of the Protectorate may be said to be two. In the first place, the Protectors decide the fate and fortunes of persons; and, in the second place, they undertake to represent Egypt in regard to all other Powers.

If the Protectors want a person to go, he has got to go; if they want him to be appointed, he has to be appointed; if they say he is to be in disgrace, he is in disgrace. They have invented their system of control, and they enforce it by clearing out of the way any one who thwarts it. Their quarrel with the Khedive was entirely a personal one. He did not suit them, and so they made up their minds to be rid of him. We learn from the French Yellow-book that so early as March of last year Mr. VIVIAN was instructed to suggest, not officially, but by way of a happy thought, that the Khedive should abdicate. The answer of the Khedive was practically given by his contemptuous dismissal of his European Ministers. It had been hinted to him that he would have to go, and he accepted the challenge, and said that, instead of his going, Mr. WILSON and M. DE BLIGNIÈRES should go. The Protectors did not trouble themselves with the Khedive's justification of this step. They took it, as it was meant to be taken, as a stage in a personal quarrel, and pronounced it to be most disrespectful to them. So, again, when the Khedive launched his own private scheme of insolvency, it was the Italian Consul who asked whether he meant to submit the scheme to the Powers or to put it into execution at once; and it was Germany and Austria that gave him notice that they would not hear of a scheme being put into execution which had not been submitted to them. The Protectors were considering not what details in the Khedive's conduct were objectionable, but what was to be done with the person who had displaced them. And here it may be remarked that, in working the personal side of the Protectorate, France has shown herself much more resolute and audacious than England. For some time England kept back France from dealing with the Khedive; but at last France would not be kept back any longer, and so the Khedive was deposed. When the new KHEDIVE was installed, he was ordered to accept Controllers, and France ordered him to accept M. DE BLIGNIÈRES. The KHEDIVE begged hard for some one else, but he begged in vain. France liked the notion of M. DE BLIGNIÈRES supervising a Government from which he had been dismissed, and so he was made supervisor. But there were to be Ministers as well as Controllers, and the beginning of the quarrel with ISMAIL had been his dismissal of NUBAR PASHA. The Protectors at first thought of insisting that NUBAR should be taken back, and only yielded in consideration of a right of veto being accorded to their Ministers. It might have been thought that NUBAR PASHA would have been sent back as soon as there was an opening for him under the new VICEROY. But NUBAR PASHA had fallen out of favour. It was decided that not only should he not go back to Egypt as Minister, but that he should not go back to Egypt at all, until the Protectors had made him feel what it cost to displease them. He was in Paris, and in Paris he had to stay, a decree of exile being fulminated against him. Such is the mode in which the Protectorate is made to work; and it must be owned that it is a very practical mode. All Oriental Governments are personal Governments; and the easiest way of controlling them is to make those composing the Government feel that they have no political existence except that which they are allowed to have.

But the Protectors not only manage Egyptian affairs in Egypt, they represent Egypt to the outer world. To begin with, they settle the relations of Egypt to the Porte; and the most adverse critic must admit that they have shown much firmness in insisting that the proper relations of Egypt to the Porte were those, and only those, which they from time to time considered it advisable they should be. When they were trying to get the Khedive to abdicate, they told him that, if he did not abdicate, they would have him deposed, and that his deposition would involve the revocation of the Firman of

1867, by which, in contravention of the Mahomedan law of succession, the Viceroyalty was to pass to the Khedive's eldest son. While the Protectors and the Khedive were still hesitating, the Porte took the initiative, and telegraphed to the Khedive that he was deposed, and was replaced by his son. This was precisely the result at which the Protectors had been aiming, but the Porte thought it could do a stroke of business on its own account. It seized on the ground occupied only a day or two before by the Protectors, that the same power that could depose the Khedive could revoke the Firman regulating the succession. But this view of the relations of the Porte to Egypt did not suit the Protectors when once they had got TEWFIK in and ISMAIL out. They pointed out to the Porte that it was monstrous to suppose that the SULTAN could play fast and loose with his Firman to Egypt. That of 1867 had been communicated to them, and they had got used to it, and would feel uncomfortable if it was not left in force. The French and English Ambassadors were directed to see that the Porte did not issue any Firman installing TEWFIK until France and England had seen it, revised it, and approved it; and the Porte was plainly told that it must not insert anything in the Firman which would place TEWFIK in a different position from that which he would have occupied if his father had died and he had become Viceroy by inheritance. For a whole month the diplomatists hammered away at the draft Firman; England and France representing Egypt, and Turkey trying on a series of astute dodges, by which it was hoped that words might be slipped in making Egypt more dependent. When the French and English Ambassadors at last got the Firman they wanted, they communicated it to their colleagues. They, as representing Egypt, settled the Firman, and then told those who did not represent Egypt what it was they had settled. But the Protectors have to do, not only with the Porte, but with the Powers having treaty rights against Egypt—that is, all the Powers who joined in setting up the International Tribunals. With these Powers the Protectors treat, not through Egypt, but directly. When the question of the Domain Loan had to be settled the KHEDIVE was ignored. The Controllers went not from Cairo, but from London and Paris, to Vienna, and settled it there. At the same time the Protectors made a proposal that the settlement of the Egyptian debt should be left to a French and English Commission, and that the Treaty Powers should accept the conclusions of this Commission. Austria refused, and it is not perhaps surprising that she should have refused. But what deserves to be noticed is the nature of the proposal and the mode in which it was made. France and England negotiated for Egypt just as if they were Egypt; and this is what the Protectorate means externally, just as internally it means the removal, promotion, or punishment of this or that person according as the Protectors approve or disapprove of his behaviour.

THE DUKE AND THE EMPRESS.

THERE was once a leader of men, in fiction, who was accustomed, on the testimony of his biographer, now and then to divert his followers with "some jokes he had "kept for a season of need." It must be acknowledged that the present Government have followed this practice, not without success, in the matter of the Duke of ARGYLL and his unfortunate propensity to edit the telegraphic compositions of the late Sir JOHN KAYE. Lord GEORGE HAMILTON appears to have profited by his sojourn at the India Office. He discovered, or somebody discovered for him, that in the course of his famous Secretaryship, guided as it was by principles the reversal of which has led to untold woes, the DUKE had bestowed upon HER MAJESTY the title of Empress of India. He mentioned this discovery on that Midlothian visit which Sir WILLIAM HARCOURT, with ominous infelicity, described as the campaign of DAVID against GOLIATH. Then followed the neat little comedietta of Friday night in last week, wherein Mr. STANHOPE and Sir H. D. WOLFF played their parts with much gravity and discretion, and brought down the House very deservedly. The Duke of ARGYLL looked into the facts, and alas! the facts were exactly what had been stated. Even the energetic eloquence of Mr. BRIGHT could not have found occasion for the utterance of his famous and favourite monosyllable. Half a dozen years before an immoral Cabinet imposed the blot on the QUEEN's head, the Duke of ARGYLL had himself upset the ink. If the title "Empress of India" was an insult to the native or neighbouring princes, the DUKE had sanctioned that insult as far as in him lay. If it was a base and tawdry imitation of tawdry and base originals, so much the worse for the DUKE. If it menaced English liberty with unutterable things, and was, as we have since seen, directly responsible for the violation of the Bill of Rights, the conversion of England to immoral principles of action, the failure of the Irish turf harvest, and the unsatisfactory depression of the revenue, all these things were in a manner upon His Grace's head. At least he ought to have foreseen them; and, if he did not, his character for statesmanship is damaged to serve his character for good intentions. Obviously the joke was a very good one against the Duke of ARGYLL, and not a bad one by any means against his colleagues and his party.

The DUKE, however, is evidently possessed by the eager spirit of the true artist, who never thinks a thing so good that it may not be better. Lord GEORGE HAMILTON's joke was, as we have said, a good one; Sir H. D. WOLFF's and Mr. STANHOPE's diversion was a good comedy well performed. But the Duke of ARGYLL set to work to improve upon it, and on the whole he succeeded. It was laughable as the matter stood on Friday night, but it was much more an occasion for mirth by the same hour on Monday. By that time he had taken his case into his own hands and the Lords into his counsel. He entreated them to allow him to make an explanation, and a very odd explanation it was. In the strict proprieties of the English language it should perhaps rather be called a confession, for the DUKE admitted the facts as they stood. Now, had he stopped there and joined in the laugh against himself, all had been comparatively well for him. For as the supporters of the Government are not for the most part animated by that holy conviction of the villany of all their adversaries which is a pleasant feature of the mental attitude of those adversaries themselves, they would have been contented to laugh at the Duke of ARGYLL and his friends without describing them in the vocabulary of seventeenth-century fanatics. Nor, we should have thought, would such laughter have broken the DUKE's bones. He had indeed been able to show that he did not himself speak against the Royal Titles Bill. This, it seems, made a Conservative friend of his, who thought he had so spoken, a "sadder and a wiser man." We all know that there is infinite room in the Conservative constitution for increase of wisdom, but this particular Conservative must be an easily saddened man. Perhaps it might have been expected that the DUKE, to whom "Em-"press of India" seemed so natural and useful a title, would have given his friends a hint that they were taking the matter a little too seriously. But, things being as they were, he certainly should have held his tongue on Monday; or, at any rate, have abstained from endeavouring to defend himself. For in the course of that defence he succeeded in producing several arguments of some strength, if not of great novelty, in support of the much-condemned designation, and one against it which was a singularly unpleasant one for his own side. The title he had given was, he said, one which had become more or less customary in Hindostan. So said the Government at the time. It was useful to express the sense of the word "sovereign." So argued the supporters of the Ministry. But, says the DUKE in effect, "Though I did "not vote or speak against the measure, I am rather sorry "I did not." And he then quotes an expression of SHERE ALI's on receiving the official intimation of the title, which goes to show that that prince at any rate saw in the title of Empress something like an assertion and confirmation of our position in Asia. Here is another ratification of another argument for the title which, good or bad, was advanced at the time. So that the Duke of ARGYLL has proved three things. The first is that the joke against him is a thoroughly good joke, founded upon fact. The second is, that the sound and fury which his friends emitted on the subject—unchecked, if not encouraged, by himself—was mere sound and fury, inasmuch as a prophet of their own had used the terrible phrase without a suspicion of its wickedness. The third is, that the ridicule with which they also assailed the title was from his present, and probably his past, point of view quite unfounded. Therefore, those who did not laugh at the figure the DUKE

out before may justly laugh now, and those who did laugh may be excused for laughing again. The Conservative friend whom he so unkindly saddened may unbend his tristful visage, and allow his lungs to crow, without fear this time of a reference to *Hansard*, which is indeed of itself calculated somewhat to sadden. For the DUKE has very emphatically written himself down a forgetful person, and the reverse of a humorous one. In the words of a famous apologue which was once, we believe, told for his own benefit in the House of Lords, if it pleases him to do this, it certainly does not hurt his political opponents. Parliament is not very full of jokers just now, and in default of somebody to laugh with, it is always a consolation to have somebody to laugh at.

We should be much more thankful to the DUKE than we are at present if we could think that his woful case would convince his friends of the folly of mounting the high horse on inappropriate occasions. We ourselves did not pretend to admire the addition to the Royal title, for "QUEEN" seemed to us to be good enough; but what volumes of patriotic high-falutin' were uttered and written about this Empress of India business! Only the groves of Blarney could appropriately hold the defunct imperial personages whose evil deeds were quoted against it. The morals of TIBERIUS and the manners of the first NAPOLEON, the mild domestic pastimes of NERO and the foreign policy of CHARLES V. were, or might consistently have been, all declared to be part and parcel of the conceptions of Empire, Emperor, and Empress. It was difficult sometimes to make out whether the disputants were making most of the fact that there had not (at any rate for a long time) been an Empire in England, or of the fact that there had very recently been an Empire in France. And all the while HER MAJESTY had been for years decorated with the obnoxious title by the authentic hand of the Liberal Indian Secretary in the very form which was afterwards adopted. How deeply the Duke of ARGYLL must have meditated on the counsels of the wise but wicked philosophers who deprecate handwriting in certain relations of life! How much better would it have been for him to accept the simple language of his subordinates, and not to rush into elaborate literary composition of his own. In just this arbitrary and tasteless way, it will be remembered by many, pastors and masters at school and college used to alter and refashion the chaste Greek and Latin of our hexameters and iambics. The DUKE'S case should be a warning to all critics and other improvers. Whether it will be a warning to his political friends is, as we have hinted, a point on which we should like to feel more confidence than we do feel. Hitherto there have doubtless been many worthy people who have held that by no possibility could such an abomination as "Empress of India" be the sprout of any but a thoroughly Tory, and therefore thoroughly wicked, brain and heart. They have probably thought that it must have taken even a Tory a great deal of trouble to commit such a wickedness as this; and now it appears that it was, if not invented, at any rate first officially done, by no less a personage than the Duke of ARGYLL. Between the theory of a momentary temptation of the Evil One to which the good DUKE innocently succumbed, and the theory that Tories are not so wicked after all, it seems that these distressed persons will have to decide. It cannot be doubted that they will choose the former.

DISCIPLINE WITHOUT FLOGGING.

AN inquiry is now being carried on at Pietermaritzburg in Natal into the truth of certain "gross exaggerations" and "transparent untruths" which have lately been uttered against the British troops in the Transvaal. Considering who the author of these "gross exaggerations" and "transparent untruths" is, it is certainly expedient that such an inquiry should be instituted. Dr. RUSSELL has not his reputation to make in journalism, and he is consequently not at all likely to make startling stories more startling in order to gain acceptance for his letters. Neither he nor the journal for which he has been acting as Special Correspondent in South Africa is under any special temptation to circulate malicious stories against an English army in the field. On the contrary, if either the *Daily Telegraph* or Dr. RUSSELL had any bias in the matter, it would rather have been towards making much of the gallant regiments who had gone out to defend the peaceful colonists against the bloodthirsty Zulus. The last thing that could have been expected in the columns of a journal which has been a fervid supporter of that and every other war which the present Government have waged was a demonstration that, from the peaceful colonist's point of view, there was not very much to choose between the Zulus and the defenders. Nor is Dr. RUSSELL a man who is likely to be shocked at any trifling breach of discipline. He has seen a great deal of war, and something of most of the armies of the world. He knows what young recruits are like, and how much allowance must be made for the demoralisation whether of defeat or of victory. His testimony comes accompanied, therefore, with almost every recommendation that such evidence can possess, and we frankly confess that upon a matter of this kind the report of a military inquiry being instituted comes attended with singularly few recommendations. It is almost impossible that such an investigation can be begun with a simple desire to arrive at the truth. No Government likes to discover that its troops are utterly undisciplined, that they have no notion of yielding obedience to their officers, and that their favourite pursuit is the harrying of the civil population. It is impossible that such a state of things should exist without some one being to blame for it; and, if it is proved to exist, the second stage of the inquiry is likely to be the unpleasant one Who is to blame for it?

The fact that Sir GARNET WOLSELEY should have anticipated the result of the inquiry by describing statements as to the accuracy or inaccuracy of which he could not possibly know anything as gross exaggerations and transparent untruths is in itself an indication of the attitude of the military authorities towards Dr. RUSSELL. They may not in the end deny that some of his accusations are partially true, but they will not give judgment in his favour even to this extent unless facts make terribly against them. Nor is it likely that the witnesses on Dr. RUSSELL'S side will be at all anxious to come forward to make good his statements. Unless they are called by the military authorities, they will apparently know nothing of the inquiry until it is over; and unless the military authorities are very peremptory in summoning them, or very liberal in payment of travelling expenses, they will not be disposed to go a long distance for the purpose of giving evidence which, as they will shrewdly suspect, the Government can have very little desire to hear. The one expedient which could have secured public confidence for the inquiry seems unfortunately not to have been thought of. Dr. RUSSELL says that, though his letter was published in London on the 21st of November, and he did not leave the Transvaal till the 23rd of December, and Cape Town till the 13th of January, he had no information that an inquiry was about to be held. The absence of the prosecutor is so injurious to anything like confidence in the result, that it is strange that the military authorities should not have tried to keep Dr. RUSSELL in South Africa until they had heard what he had to say. At least it would have been strange except on the assumption that they already knew too well what it was, and that they were not prepared to disprove it. If that was so, the wonder disappears. It must be a very strong Secretary of State or Commander-in-Chief who is not disturbed by reading of nightly "scares," and "stampedes," of "wild "alarms and outbursts of musketry and cannonading at "nothing," and by finding as he goes on that this was the conduct of the troops in presence of the enemy, and that when they had left the enemy behind them it became far worse. All along the road from Pietermaritzburg, towards the front, Dr. RUSSELL heard "stories of indis-"cipline and excesses." The soldiers had to be forbidden to go into the towns and villages they had come to defend. Most of Dr. RUSSELL'S narratives are derived from officers, and in one case he says that the taverns had to be closed by order of the commanding officer, in order to prevent the soldiers from running riot on the march. It does not seem to have made much difference whether they were drunk or sober. The desire for liquor made them just as mad as the drinking of it; when they were denied it they wrecked the public-houses; when they got it they wrecked any building that came handy. In one town Dr. RUSSELL was told that not a single store had escaped pillage. If this was the conduct of British troops in British territory, what would it have been likely to be in an enemy's territory?

There are three morals which follow very plainly from

this narrative of Dr. RUSSELL's. One is the mischief that comes of not keeping the regiments first on the roster for foreign service up to their full strength. It was pointed out at the time that the regiments that left England for South Africa upon the news of Isandula were largely composed of officers who had never seen their men, and of men who had never seen their officers. With seasoned soldiers this may be comparatively a small matter. To them an officer is an officer. It is the institution they obey, not the man. But to recruits it matters a great deal, and the volunteers who came forward to fill the gaps in the regiments ordered to the Cape were largely recruits. What Dr. RUSSELL describes is very much what was predicted when the regiments were embarking. Things are worse than they were expected to be, but the difference is in degree, not in kind. The second moral is, that we have dispensed with flogging without dispensing with the acts for which flogging used to be inflicted. The despised and contemned lash would have put a speedy end to these outrages. If the first offenders had been flogged into sobriety and a moderate regard for rights of property, the complaint would not have proved as infectious as it did. A great deal was said last Session of the superiority of other punishments to flogging. Perhaps the authors of this view will be ingenious enough to point out what punishment they would have inflicted under the circumstances detailed by Dr. RUSSELL. The colonel who told Dr. RUSSELL that, if he carried out his orders, he would not have a man for duty, because one half of the troops would be guarding the other half, exactly describes the situation. When men are wanted for service, a military prison is the last place in which they ought to be. The punishment suitable to their offence is something unpleasant enough to constitute a deterrent force, and rapid enough not to keep either them or those who have the charge of them away from duty. The third moral is that our officers have suffered from the discussions of which military discipline has lately been the theme. It might have been hoped that, in view of such a state of things as that described by Dr. RUSSELL, a commanding officer would have flogged, with or without law, and trusted to the necessities of the case to justify him. If English officers will not maintain discipline at any risk to themselves, it is a bad look out for the English army.

EMPLOYERS' LIABILITY BILLS.

THE House of Lords has already had two Employers' Liability Bills before it; and the House of Commons will shortly be in possession of several more. Lord CAIRNS has declared that the Government would not support Lord DE LA WARR's Bill; and it has been already withdrawn, its author consenting to plead his cause in the Select Committee on the Government measure. At all events strenuous efforts will be made to import provisions similar to those of Lord DE LA WARR's Bill into the Government measure as it passes through the Commons; and on this ground it may not be time lost to examine in what points the two Bills differ from one another. The LORD CHANCELLOR contents himself with a single alteration in the existing law. He proposes to make the employer liable for the negligence of a "servant in authority." If a workman is injured or killed by such negligence, he or his representatives shall have the same right of action against the employer as though there had been no common employment. The term "servant in authority" is defined in three alternative ways. In reference to a railway it stands for any person entrusted by the Company with the management of the railway or traffic, or of any particular part of the railway or traffic, or of any station or works connected with the railway. In reference to a mine, it stands for any person holding the office of agent or manager. In reference to manufactures or works generally, it stands for any servant appointed by his employer to manage such manufacture or works, or any portion thereof.

The fault of this Bill is that it does not fairly carry out the principle on which it seems to be based. By giving a workman injured by the negligence of a "servant in authority" a right of action against the common employer, the Bill admits that it is fair that a workman should be compensated for injuries against which no care of his own could have protected him. An employer, on this view of the case, is bound not to injure his workman, either by his own act or by that of his immediate agent. It would be unfair to hold him responsible for acts done by servants over whose selection he had virtually no control; but where the injury can be traced to the act of a servant picked out by the choice of the employer to exercise a certain delegated authority, the reasoning does not apply. A man who employs a thousand men cannot be expected to ascertain that none of them are careless or awkward. But if he employs ten men to manage those thousand, he stands as regards them in a wholly different position. There is nothing impossible in such a degree of choice as may guarantee the prudence of the ten men to whom he makes over his power. He knows that he is investing them with authority to which the workman has no choice but to submit or lose his place. For his own sake he must make certain inquiries into the character and antecedents of the men thus picked out from among their fellows, and it will be no more difficult to inquire into their possession of the qualities which will prevent them from bringing those under them into avoidable danger. The position of a workman towards the men thus specially set over him is also different from his position towards his fellow-workmen. The latter cannot order him to do what he does not choose to do. If he thinks that the thing they propose to do, or the way in which they propose to do it, will involve danger to life or limb, he can refuse to join them in doing it, or in doing it in that particular way. If both sides hold to their own view, it is the servants in authority who have to decide between them. But when a workman differs in a similar way from one of the men set over him, he must either submit or risk being discharged. Consequently it is of infinitely greater importance to him what manner of man it is that gives him orders than what manner of man it is that has to obey orders in common with him. The Government Bill recognizes this in principle, but stops far short of any rational application of the principle. Why is a person "entrusted "by the Company with the management of the railway "or of the traffic" to involve the Company in liability for his negligence, "and no other person"? The platelayers or signalmen may nominally be under the orders of the General Manager or the Traffic Manager, but they have no more to do with him than they have with the Railway Commissioners. Even the station-master at any large station is far too exalted a personage to be appealed to at every point by every porter or pointsman. The service of a great railway is a hierarchy in which there are many subordinate ranks, and to each man the man immediately above him—the man to whom he looks for instructions, and whose orders he is directed to obey—is the "servant "in authority." Lord DE LA WARR's Bill was in this respect decidedly preferable to the Government Bill. He aimed at creating the same kind of liability, but he extended it to every "person of any superior grade in the "service of the employer who has superintendence en-"trusted to him," and to every "person to whose orders "or directions" the workman is bound to conform. This definition makes the wrong and the remedy co-extensive; the definition given in the Government Bill provides a remedy which is co-extensive with the wrong merely in name. Lord DE LA WARR's Bill was a Bill which would make a substantial difference in the law; the Government Bill will profess to make a difference in the law, while all the time it will leave it pretty much what it is.

There are two other points in which Lord DE LA WARR's Bill differs from the Government Bill. Lord DE LA WARR proposed to make the employer liable for the wrongful act of any person in his service, if this wrongful act be done in obedience to the employer's rules or by-laws, or to instructions given by any person acting under the authority of the employer. This provision seems to follow so naturally from the principle assumed in the Government Bill that we can scarcely suppose that Lord CAIRNS will refuse to introduce it into his Bill. If an employer may be held liable for an injury caused by the negligence of a servant in authority, for which his responsibility may, morally speaking, be the very slightest possible, much more ought he to be held responsible for acts done in obedience to rules for which, as being put out under his direct authority, his responsibility, morally speaking, is complete. As regards the other point of divergence from the Government Bill the case is not quite so clear. Lord DE LA WARR proposed to make the employer liable for any injury caused to a workman "by reason of any defect in the works, ma-"chinery, plant, or stock used for his employer's business."

Both sides have something to say for themselves on this head. The contention of the workman is that the law ought to protect him against dangers caused by the fault of other men and against which he has no power of protecting himself. The instance commonly given is that of a bricklayer who is injured by the fall of the scaffolding on which he is standing. Building has its recognized risks against which no amount of care will insure a man, but this is not one of them. Upon scaffolding, if it is made of proper materials put together with proper care, a man may stand as safely as on the ground beneath. It is only when the wood or the rope is faulty, or when the poles and planks are badly tied together, that the ordinarily careful and skilful workman is in any danger of coming to harm. He has no means of knowing the quality of the materials employed or the manner in which they have been put together. He must take all this on trust; and therefore, if his trust proves to be misplaced, he looks to his employer for compensation. The employer has provided the scaffolding, and he ought to have taken care that it was fit for the purpose for which it was used. The employer answers that he knew no more about the character or construction of the scaffolding than the workman himself. It was made of materials selected and put up by workmen serving under another employer, of whose acts he—the employer against whom it is sought to establish the liability—knew nothing, and for which he cannot be held responsible. In controversies of this kind the chief consideration is how a liability can be most conveniently asserted. It is not denied that a builder may be quite ignorant of the badness of the scaffolding he uses; nor, again, that the maker of the scaffold may in turn throw the blame upon the timber merchant or the rope manufacturer. But, if the workman has to hunt for compensation through all this long series of possible offenders, it is plain that he will never obtain it; and a most effectual safeguard against the supply of dangerous goods will be lost. If, on the other hand, the remedy lay in every man's own hand—if the workman had his right of action against the builder, and the builder had his right of action against the scaffolding-maker, and the scaffolding-maker had his right of action against the timber merchant and the rope-maker, the real culprit would be reached at last; and the knowledge that this would be the case would constitute a powerful safeguard against the particular wrongdoing which it is desired to check. In all respects, therefore, Lord De La Warr's Workman's Compensation Bill is in our opinion superior to the Lord Chancellor's Employers' Liability Bill.

STATESMANSHIP AND MORALITY.

On the first day of the month of Moses last an address was delivered by Mr. Frederic Harrison to a gathering of believers known as Positivists, which address was afterwards published in the world at large, in the *Fortnightly Review*, on the first day of the present month, vulgarly called February. The scope of the address or essay, which is entitled "Empire and Humanity," is to demonstrate that the former and the latter are mutually exclusive terms; that the British Empire is morally on a level with slavery and the slave-trade; that, like these odious institutions, it is a "huge crime against mankind"; and that, since we cannot get rid of it all at once, we are to look upon it as a passing responsibility which unfortunately prevents for a time this "petty island" from attending to its proper work. Moses, who is often referred to by Positivists in terms of cordial approval, was, as is well known, strongly opposed to a policy of invasion and annexation; he had no belief at all in the superiority of his own race and in any preferential rights which might flow therefrom; and a chief aim of his policy was to foster the budding civilization of Og and Sihon, of the Amalekites and Canaanites. But this is by the way. The point on which we wish to fix the attention of our readers is the charge of "wickedness" brought by some against our Empire and by others against those who now administer it. This accusation is not made by Positivists only. If it were confined to that funny little sect it would hardly be necessary to discuss it at length. But for a year or more the same sort of talk has resounded from a hundred Liberal platforms, and been echoed back from a hundred Nonconformist pulpits. At the next election the criminality of the Government will be insisted on by Opposition candidates as much as its imbecility. A charge repeated so often comes at last to be believed by many both of those who make it and of those who listen to it. The intelligence of the average voter cannot be termed active or acute; and the frenzy of partisan feeling into which many Liberal politicians have gradually lashed themselves allows no hearing to the remonstrant voice which pleads for fairness, charity, and moderation. When it is said that a scientific frontier to India means theft, neither more nor less, and that the war in Zululand was downright unprovoked murder; and when this is said often enough, and by men of sufficient authority, the average hearer, who may at first have had an obscure sense that these statements are distortions of the truth, comes at last to think that so after all it must be, else so many people would not go on saying it. The average voter hears only one side—his own side—of the question; or if he by chance looks at the other, it is simply for polemical purposes, and not with the aim of understanding it. In ordinary times there is a sort of instinctive good sense at work which leads people to recoil from fierce and violent and sweeping and insulting charges brought freely and glibly against opponents. Our opponent is of course in the wrong, but still he is not a bad fellow after all. But in times of great and prolonged excitement this sort of diet is the natural food which the passions crave; and even if the public mind shows a tendency after a time to cool down, there are too many persons interested in keeping up its temperature for it to be left to its natural course. And, as it cools, the vexation and disappointment of the bellows-blower increase. In the very hotbeds of a cantankerous Radicalism the artisan voter is not inflamed with the passions which it suits his leaders to attribute to him, and by which his leaders are themselves too often inflamed. He can neither get into Parliament nor into office, nor even into the Town Council; and he is free therefore from that stimulus of rivalry and ambition to which much of the righteous indignation of his leaders is due. But his means of enlightenment are scanty, and when he hears his country charged without ceasing by those whom he is accustomed to trust with robbery, murder, perfidy, tyranny, aggression, and the like, he may end by fancying that there must be something in it, and give his vote to the virtuous accuser.

Mr. Bright asked the other day what was the difference between the homicide which brings a man to the gallows and the homicide which wins for him the Victoria Cross. This was, at all events, the purport of his question. And from the point of view of the Society of Friends the only difference is that the latter crime is more wholesale. On the same principle, the guilt of the assassin and of the judge who sentences him to be hanged is much the same. Tried by this standard, Mr. Gladstone is even more "wicked" than Lord Beaconsfield, for he is answerable for more bloodshed, and was himself a member of that "incapable and guilty administration" which five-and-twenty years ago Mr. Bright denounced in one of his finest bursts of eloquence. But Mr. Gladstone, we are told, is a penitent sinner, a prodigal who, having once fed swine among Conservatives, has come at last to his true home amid the Radicals; while Lord Beaconsfield's heart remains as hard as the nether millstone. The former is now "as good as he is great"; the latter is a compound of Ghenghis Khan and Mephistopheles. It is hardly possible to keep up any political agitation for a long period without the free use of superlatives, and the more signs the country gives of a reaction, the more highly spiced, not to say poisonous, are the epithets to which the agitator is forced to have recourse. But as the stock of adjectives in the English language, though extensive, has yet a limit, and as only a certain percentage of them are uncomplimentary, an end must come to this at last. Unskilful in tactics, the Liberals made the mistake of using up the most telling epithets early in the fray. After calling a man a villain and an idiot to begin with, you cannot very well, at a later stage of the proceedings, produce an effect by saying that his conduct is not thoroughly sagacious and moral. You have to keep on calling him a villain and an idiot, and, as the proceedings are lengthy, you end by becoming a bore. After listening to the oratory which was so plentiful last autumn, many a hearer must have ejaculated, as the American did to the young Englishman who quitted the Uffizi Gallery in a transport of delight over an anæmic Virgin by Botticelli, "I guess, stranger, you've been whipping yourself up with your own tail." By the wholesale use of the most denunciatory terms which the dictionary furnishes the opponents of the Government must have forced some, even among their own supporters, to ask themselves if such epithets can be well deserved, and have led many impartial bystanders to reflect anew on the moral problems which statesmanship involves.

"What is right," one often hears, "for an individual is right for a State. What is wrong for an individual is wrong for a State." To dispute or to qualify this proposition brings down on one's head an amount of virtuous indignation enough to turn a steam-engine. And yet, like many other general propositions, it may be, till qualified and explained, either perfectly true or utterly false. If it means that there is a moral law which nations, in their corporate character, are bound to obey, which they defy at their peril, and the breach of which involves certain retribution, it is true. But if it means that the application of the general principles of morality to particular cases is necessarily identical in the case of nations and of individuals, it is false and misleading. By shuffling the cards cleverly, by using the words now in one sense and now in another, it is easy for an adroit speaker to gain the reputation in the eyes of the unwary of being a man of high moral tone when he is really only a sophist. The fallacy which underlies the proposition, when stated absolutely and without any qualification, is plain enough to those who read it at breakfast-time in the morning paper; but it escapes notice overnight amid the exhilarating hubbub of Kentish fire and prolonged cheering. The fallacy lies in just ignoring the main difference between the two cases. Behind and above two or more individuals whose interests clash, or whose feelings one to another are unfriendly, is seated the

law, stronger than each or all of them; to that they can appeal, to that they must bow. When nations quarrel, there is no appeal except to arms.

Even in the case of individuals it is recognized that, where the law is absent or powerless, or where wrongs have been committed of a kind for which the law can provide no remedy, a course of action may be permissible or even praiseworthy which would be culpable or criminal if legal redress were to be had. The difference which the presence or absence of the law may make in the morality of acts outwardly the same is measured in part by the difference of the sentiments with which we regard Charlotte Corday and those with which we regard a mere ordinary murderer. The latter is felt to be a mere beast of prey; the former lives in history as a heroine. It is true that there are well-meaning people who, if they hear the killing of Marat spoken of as a good deed, produce a little string of texts and precepts to show that it was very wrong; but everybody will at all events admit that between such an act, even if we feel bound to blame it, and the taking away of human life to gratify a private grudge or to gain possession of another man's wife or property, there is a wide difference. Whenever, in short, an emergency arises in which the protection ordinarily given by society to its members is not forthcoming, we are thrown back on that primeval right, that mere struggle for existence, which preceded the social organization of mankind. Our notions of right and of duty are inevitably shaped and coloured by the legal and social conditions of our environment. We live in an orderly and law-abiding society. This is the postulate which in ninety-nine cases out of a hundred underlies our judgment on the morality of our own acts and of those of others; and a careless thinker, such as most of us are, easily falls into the snare of fancying that what holds good of the ninety-nine cases holds good also of the hundredth, in which this postulate is absent. Now the exception and emergency of private life is unhappily too often the rule among nations. For an injury or an insult suffered by one nation from another, there is no redress except by an appeal to arms. There is no international tribunal before which the peoples of the earth can carry their grievances, and whose decision they will accept as binding. We are far from thinking that, even if such a tribunal existed, it would put an end to war. Armies would be as necessary to enforce the verdict of this tribunal against a refractory litigant as policemen and gaolers are to deal with a man who will not pay a fine in a police-court. But wars under these circumstances would lose that character of lawlessness and wantonness which now so often distinguishes them. However, such a tribunal is not yet established, and there seems no reasonable hope that it will be soon established. And there is a certain class of cases which, even if it existed, it would be utterly incompetent to deal with. The expansive power possessed by certain races brings up a set of moral problems which cannot be met by any general rule. The German and the Slav have lived alongside of one another for ages, and the German prospers at the expense of the Slav. He has taken his land; he has Germanized him and absorbed him; and he will go on doing so. The overflow of population from this country drives us, whether we will or no, to a policy of colonization, and in many cases of conquest. It may be safely said that no great international change has ever taken place, and, indeed, that no nation has ever been founded, except by means which, tried by the standard of private right, are more or less indefensible. And yet it is this private right only to which appeal is made by that class of persons who now seek to prove their own virtue by slandering their country.

These considerations are wholly overlooked by those who declaim against the "wickedness" of the wars in South Africa and Afghanistan. We are not here discussing the wisdom of those wars; that is another matter, on which well-informed and right-minded people may fairly differ. We are not saying that it would not have been practicable to avoid them; and of course a war which can be prudently and safely avoided is morally unjustifiable and wrong. But this is a question of fact and argument; "wickedness" is a matter of motive and intent. When Liberal speakers denounce these wars as sins against Heaven and mankind, we can only ask, What would Germany do if France were to summon to arms every able-bodied man in the country? Would it be "wicked" to anticipate, if possible, a blow which could not be averted? And this, it is plausibly alleged, and is by many persons besides Sir Bartle Frere honestly believed—it may have been erroneously alleged and too hastily believed—was our situation with regard to the Zulus. It is at least certain that Cetewayo's warriors were not brought together for the purpose of promoting peace on earth and goodwill among men. They were there to fight, to kill, to conquer, to plunder. What, again, would Germany do if a French embassy was received with honour and confidence at St. Petersburg, and the German ambassador turned back with menace and insult at the Russian frontier? Would it be concluded that French and Russian statesmen were laying their heads together for the benefit of Germany, or would the task of seeking an explanation be handed over by Prince Bismarck to Count Moltke? We may think it injudicious to have interfered at all in Afghanistan; we may criticize as severely as we please the time, the mode, the extent, the objects of the interference; these are points on which the opinions of competent judges are divided. But the Government judged otherwise. Impugn their judgment, if you like; but have done once for all, if you do not wish to lose all character for fairness, for sense, and for decency, with mere vituperation. The feeling that the Government has not had fair play has led not a few Liberals to transfer, at all events for the moment, their support to a party with which they are in many respects out of sympathy. The Government represents the country before the world; and though a continuance of the tactics of late adopted by some of the Liberal leaders can only win the Government votes, moderate men, who think more of their country than of their party, will deplore a course of action which tends more and more to destroy the wholesome and manly traditions of English public life.

THE CHANNEL ISLANDS AND LAND REFORM.

EVERY student of politics knows the hard duty which a fact or supposed fact has to do when it has been once prominently brought forward to prove or illustrate some political point. Since Mill's well-known reference to Jersey and Guernsey in his *Political Economy*, these islands have always been a favourite battle-horse of the advocate of small properties, and of late they have been frequently brought forward in this connexion. Mr. Shaw Lefevre told the old story over again no longer ago than last October in the *Fortnightly Review;* and Mr. Shaw Lefevre has recently announced his intention of keeping the Government up to the plan of facilitating the acquisition of small properties by Irish tenants and labourers. Indeed, from the experience of the end of last week and the beginning of this, it might be imagined that the Session had set seriously in for the discussion of such points. This being the case, it may perhaps be worth while to see what the lesson of the Channel Islands really does teach, and whether any such unmistakable evidence of the beauty of small proprietorship, divisibility of inheritance, and so forth, exists in it as is generally assumed. Such an investigation is not likely to throw any discredit on the land system of the Islands, which is probably very well adapted to their necessities. It is undeniable that land is there very much subdivided, and at the same time excellently cultivated. It is certain that the system of land transfer and registration, as well as that which permits the creation of small rent-charges on the land, works very well. But when we are asked to accept the smiling plenty of Jersey and Guernsey as a result of these institutions, it may perhaps strike long-headed inquirers whether it may not be well to inquire what the other circumstances of the case are before assuming that the same cause, or assumed cause, will always have the same effect, or assumed effect, if set to work elsewhere. Short of Mr. Parnell's plans for polite robbery, short of Mr. Bright's vague and ill-defined suggestions, there are many arrangements for the instant and total cure of Irish distress which are based upon our venerable friend the "magic of property" and the like. The partisans of these arrangements may well be asked to look a little more narrowly into the circumstances of what has usually been one of the stock cases quoted on their side.

We shall take Guernsey for examination rather than Jersey, because the former, though the smaller, is in some respects the more typical of the two; but, in truth, the arguments which apply to one apply to the other, with hardly any variation. In the first place, then, Guernsey is an island of a compact shape some hundred miles (in round numbers) distant from the Needles. Its size is about thirty-three square miles; its population at the last census, still in round numbers, was thirty thousand. But, when we come to look a little closer, we shall find that these thirty thousand inhabitants of about two-thirds that number of acres are distributed in a very singular fashion. More than half of them dwell in a town, the town of St. Peter Port. Two or three thousand more live in what is also called a town, but is really a large straggling village, St. Sampson's, and great part of a third parish, St. Martin's, is also thickly dotted with houses. Hence the large majority of the inhabitants of Guernsey are really an urban population. The same is the case with Jersey; and as this similarity is pretty constant there will be need to recur to it. Here at once is a circumstance rather staggering to the inquirer. By a peasant proprietary he does not usually mean dwellers for the most part in the suburbs of a large town—large, that is, comparatively speaking. Again, the island is, so to speak, grouped with unusual compactness round this town or towns. They lie on the centre of its eastern shore, and such is the conformation of the land that hardly any part of it save one outlying portion is more than five miles from the market-place. Again, as every part of the island is within easy reach of the town, so is the town within easy reach of a much larger market. Potatoes and broccoli which are put on board in the afternoon can without any extraordinary celerity of despatch be sold in Covent Garden next morning. Hence all the conditions for profitable cultivation of those things in which the *petite culture* is most profitable are here eminently present. But we must look a little closer even than this. Of what class are the people who inhabit the town? If we inquire we shall find that they contain an extraordinary proportion of the class called in French *rentiers*, the class which lives on its means. The pleasant climate of the island, its reputed and partly real cheapness of provisions, the immunity from Customs duties and other Imperial taxation, and the presence of good schools, besides certain peculiarities of the natives—to be mentioned further on—have attracted a number, varying of course, but relatively very considerable, of moneyed residents. Two or three generations ago, moreover, large fortunes were made by the

islanders in ways more or less legitimate, and these have been husbanded and increased since with a diligence worthy of Scotchmen. Guernseymen of the upper and middle classes who have served in the army, navy, or Civil Service, or have tried the colonies, to a very large extent return home with their half-pay or their savings. These, with the strangers already mentioned, create a resident moneyed class, which, in proportion to a population of thirty thousand, is unusual even in England, and is absolutely unheard of elsewhere. For them plenty of shops and other commercial appliances must exist, and they require numerous domestic servants. At the second town of the island, again, a flourishing industry, that of stoneworking, exists, at which many members of a family often work together, earning wages which may be called, not only relatively, but absolutely, high. This in its turn gives employment to a small fleet of ships. But we are not nearly at the end of the list. Hitherto we have only referred to the exemption from taxation. Taking the incidence of taxes at 2*l.* 10*s.* per head in the United Kingdom, which is near enough to the truth, this, it will be observed, is equivalent to a bonus of 75,000*l.* a year to Guernsey, in return for which nothing is given except an almost nominal service in the militia. But, though the island pays nothing to the Imperial Exchequer, it receives from it not a little. A garrison of considerable strength is kept up, and a staff with several highly paid officials. Probably not less than 50,000*l.* a year comes into the island from this source, for which, let it be remembered, no penny of return or contribution has to be made. A vast sum has in time past been spent on fortifications and military works, much of which has gone directly into the pockets of the islanders, besides indirectly contributing (in the shape of roads, &c.) to their prosperity. To all this, which is the gift of art, we must add yet other gifts of nature. The climate is singularly clement, and at the same time singularly favourable to moderate labour at almost all times of the year. Manure is chiefly obtained from the rocks, the seaweed being cut under legal restrictions and costing nothing. A cheap lean-to greenhouse run up against an artisan's cottage will, without artificial heat, more than pay his rent with grapes or such-like produce. And lastly, the coast everywhere close to the cottage or farm offers fish for the catching, to eke out the produce of the ground, besides the chances of pilotage, coasting traffic (which is considerable), and other such-like gains.

Now we ask any intelligent person to put a finger on one single item of this long list which can be said to be even indirectly connected with land laws or small properties. Yet with such advantages it is impossible for the Guernseyman, save by personal misconduct, not to be prosperous. He is untaxed, the trifling local expenditure is necessarily far lower than local burdens in the most favoured spot in England, and very large sums of money brought from abroad are expended among the people, creating abundance of well-paid employment for surplus hands. At least one thriving non-agricultural industry supplements these. His markets are close at hand, and crave unceasingly to be supplied with the particular produce which soil, climate, and situation make him best able to supply. To make the argument still clearer, let us sketch what Mr. Shaw Lefevre and his friends must do with the South and West of Ireland if they wish really to put it on equal terms with Guernsey. For every compact district of seven miles by five, there must be a central town of more than half the population of that district. That town must contain private persons of means who create a demand for shops, for domestic labour, for labour of all kinds, and pay for what they want with money drawn from sources other than the district itself. Each of these districts—there will be some six or seven hundred of them—must be within easy and cheap reach of a first-rate market, must possess some little manufacture, mining, or other similar industry, to occupy a thousand or more hands, and the sea to fill up any deficiencies of food. It must have a good natural harbour, a soil neither too wet nor too dry, a climate where drought need not be feared, but where floods are physically impossible. Lastly, absolutely no taxes must be raised from it, and England must spend instead at the rate of 30*s.* a head of Imperial money. When this is done the system of small holdings may be tried, and it may be seen whether the Irishman can rival the Channel Islander. Does not the mere exposition of the case, without more words, sufficiently expose the folly of heedlessly coupling causes and effects without looking to see whether the effect is not already explained by another cause? It cannot be too much insisted upon that no one of the advantages we have catalogued has anything to do with the supposed panacea. Small holdings and free land, or rather land subject to an exceedingly delicate and ingeniously arranged set of "servitudes," have not exempted Guernsey from taxation, nor endowed it with a grammar school, with camellia trees growing freely in the open air, with endless granite quarries gaping towards the streets of London, with sea-wrack at the door for gathering, and fish at the door for catching. They certainly will not endow the hills and bogs of Connemara and the sullen plains that rot around the Shannon with any one of these things. If, as we have suggested, Mr. Shaw Lefevre and his friends could cut neat little pieces out of Ireland, dot them about the English Channel, and shape and finish them nicely to pattern, perhaps something might be done, and the experiment would be interesting. But, as it is, though we certainly shall not say that the Guernsey land system has checked the prosperity of the country, we have made it sufficiently obvious that that prosperity has other causes more than sufficient to account for it. In truth, little as it may suit preconceived notions, the tiller of the ground is at the present day little more than a player of the second fiddle in either of the Channel Islands. He is a useful caterer for the towns which other causes have created, and he derives no little prosperity from them, and from the other sources of emolument we have mentioned. In Ireland, on the other hand—at least in the West and South—he is practically the population. In short, the cases are so utterly different that to attempt to argue from one to the other is impossible. It is even unnecessary to hint at the contrast of temperament between the thrifty Norman peasant and the unthrifty Celt. The distinctions which exist of a character undeniable in point of fact, and not likely to excite any bad blood by mention, are enough to expose the fallacy.

MR. BRIGHT ON NONCONFORMITY.

MR. BRIGHT is nothing if not pugnacious, and the allocution he delivered the other day at the Union (Congregational) Chapel, Islington, by way of preface to Mr. R. W. Dale's course of lectures on the "Origin of Evangelical Nonconformity," forms no exception to the rule. He observed indeed in the course of his address that his own religious creed, like that of most people, probably depended on the accident of birth, but it was for the purpose of immediately adding that "if Churchmen had not imprisoned his forefathers for many years in Bedford gaol," he might have been a Churchman himself. And he began by assuring his hearers that he had from boyhood gloried in being "sprung from the stock of the martyrs and sufferers of two centuries ago," and was afraid his coreligionists were not always sufficiently mindful of their honourable descent. In short his feelings are not, *mutatis mutandis*, very unlike those of the little clique of converts who have lately been agitating for the canonization of the Elizabethan martyrs. Mr. Bright may be a Dissenter by the accident of birth, but he is "not ashamed of it," and would evidently be willing to appropriate the popular Dissenting version of a well-known hymn, with the substitution of Quaker for Baptist:—

> I bless the goodness and the grace
> That o'er my birth hath smiled,
> That I was born of Baptist breed
> And not a Churchman's child.

He is anxious that both Nonconformists and Churchmen should carefully study the history of the origin and course of Nonconformist opinions, that the former may learn how much they have to be proud of, and the latter how much they have to regret. Dissent has grown up, on the one hand, through the noble self-sacrifice of the fathers of Nonconformity to the claims of truth and conscience, and on the other through "the unhappy and narrow policy" of the Churchmen who for ages cruelly and vainly persecuted them. The Dissenters have been "the great advancing and reforming force in English political life," the great pioneers and champions of "civil and religious liberty." Now we have no intention of disparaging the moral and political forces which the Puritan element may have contributed to the development of our national life; still less do we desire to justify the feelings of dread and hate and contempt of Dissent which Mr. Bright—somewhat gratuitously perhaps—is pleased to attribute to the Church. No well-informed and reasonable Churchman can wish to deny that the Puritans of the seventeenth century did good service, if not quite in the way they intended, in resisting the absolutism of the Stuarts, or that the Wesleyans of the last century deserve credit for reviving a religious spirit in a period of spiritual deadness. But these admissions, if we may judge from his discourse, would by no means satisfy Mr. Bright. The burden of his tale is that, ever since Nonconformity began—and that, as Mr. Dale reminds us, was in the reign of Queen Elizabeth—the English Church has been persecuting Nonconformists, though not quite so badly as the French Church persecuted Protestants, while the martyrs and sufferers for conscience sake have been testifying through evil report and good report to the great and sacred cause of civil and religious liberty. This view of the matter is at least quite as unhistorical as that which would represent the Church as always ideally perfect, while all heretics and schismatics were simply wicked rebels against the reign of holiness and truth.

The first remark that occurs to one is that the persecuting power, generally speaking, was not the Church of England as a religious body at all. And so much as this would certainly seem to follow from Mr. Bright's not very polite description of Anglicanism as "a system of religion which has been built up, not on the foundation laid down by the Prophets and Apostles of old, but rather on a foundation laid for political purposes by monarchs and statesmen." To whatever extent this may be true, it goes to show—what is really in the main the fact both as to English and French intolerance of Dissent from the dominant faith—that monarchs and statesmen rather than Churchmen were the persecutors, and that their motives were chiefly political. Moreover, if there was ever a time to which Mr. Bright's description applies, it was notably the reign of Queen Elizabeth—by far the most Erastian period of English Church history—and that is just the period Mr. Dale dwelt upon, not without some justice, to illustrate the persecution of the Puritans. He made indeed the odd remark that the Queen "only kept the peace between Catholics and Protestants" while she persecuted Puritans. But his acquaintance with the history of her reign must be something less than moderate if he is not aware that Elizabeth "kept the peace between Catholics

and Protestants," in just the same way as between Churchmen and Puritans, only by fining, imprisoning, or executing those who refused to conform to the established worship. The only difference was that the persecution of Roman Catholics was by far the severer of the two, partly from their suspected complicity with foreign designs against the English Crown, partly because the Queen's policy at first was to conciliate the Puritans as far as possible, and hence their leading men, like Cartwright and Travers, and many others besides, were allowed to act as preachers and beneficed ministers, though without episcopal ordination. It was not until their "discontent," as Mr. Dale terms it, took a form which no Government in that age was likely to tolerate that they were at length put down. And this leads us to a further observation, which Mr. Bright has altogether lost sight of, or rather which he throughout implicitly contradicts. To his mind "the fathers of Nonconformity" were martyrs for the principle of civil and religious liberty. There was really no principle they more heartily detested or more unequivocally condemned. We will not now refer to the opinions of the leading Reformers, like Luther, Calvin, and Knox. Every one who knows anything of the subject is aware that they one and all denounced the toleration of heresy—that is, of whatever they adjudged to be such—in language not unworthy of Torquemada, and acted consistently on their avowed convictions whenever opportunity occurred. But Mr. Bright may not care to include the Reformers in his spiritual ancestry, and we will confine ourselves here to the testimony of Puritans and Nonconformists, with whom he is immediately concerned.

Now the sort of language in which the Elizabethan Puritans expressed their yearning for the sweet reasonableness of civil and religious liberty was of this kind, as it is cited in Strype; we venture to italicize a few words. "Our bishops and proud, popish, presumptuous, petty, pestilent, and pernicious prelates, *are usurpers*. They are cogging and cozening knaves. The bishops will lie like dogs, impudent, shameless, wainscoat-faced bishops." And again, "Our lord bishops, as John of Canterbury [Whitgift], with the rest of such swinish rabble, are petty Anti-christs, petty popes, proud prelates, *enemies to the Gospel*, and most covetous, wretched priests." This was the language of claimants not for toleration but for absolute and exclusive dominion. And they made no secret of it. "The Puritan preachers would have all the remnants and relics of Anti-christ *banished out of the Church*, and not so much as a lord bishop (no not his Grace himself), dumb minister (no not dumb John of London himself), non-resident, archdeacon, abbey-lubber, or any such loiterer, tolerated in our ministry." Even John Milton, in his *Treatise on Reformation*, deliberately consigned all the English bishops, "after a shameful life in this world, to the darkest and deepest gulf of hell," where he proceeds to depict their future torments with a minute and horrible particularity into which our regard for our readers will not allow us to follow him. It is hardly necessary to add that the Puritan aspirations of Elizabeth's reign took an exceedingly practical shape, which served to illustrate their true significance a generation or two afterwards. But the genuine temper of the early Nonconformists, whose history Mr. Bright is so desirous that both Churchmen and Dissenters should more thoroughly master, may be still better illustrated if we follow them across the Atlantic. If there was any set of men who might *a priori* have been expected to practise toleration towards others, surely those who had felt bound to expatriate themselves for conscience sake should have been taught by their antecedents to do so. Yet the "pilgrim fathers," when once settled in New England, became the most ruthless of persecutors, and that too—as Bishop Wilberforce points out in his *History of the American Church*—"years after the true doctrine of toleration had been carried out in Maryland" by Roman Catholic settlers, where "all who professed the faith of Christ were allowed the free exercise of their religion, as long as Romanism was the dominant belief." In New England, on the contrary, "the Puritan magistrates used without scruple the very arms of which at home they had made the loudest complaints." And they did this systematically and on principle. "To say that men ought to have liberty of conscience is impious ignorance," says one of their great authorities. "Religion admits of no eccentricities," says another. "For the security of the flock," says a third, "we pen up the wolf." The use of the Common Prayer-book was rigidly suppressed, but neither did Mr. Bright's spiritual forefathers find any more merciful treatment. "No food," says one of the laws, "shall be allowed a Quaker, Adamite, or other heretic." A whole family was expelled from the town of Salem because its head was confessedly "a dam-ned Quaker." Anabaptists were fined or "whipped unmercifully"; absence from "the ministry of the word" was severely punished by the very persons who in England had bitterly complained of being compelled to attend their parish church. But "the accursed sect of Friends" were the most severely dealt with of all. They were regarded as "energumens"—*i.e.* possessed with devils—and the law ordered that, "if any man turn Quaker, he shall be banished, and not suffered to return *on pain of death*." And many Quakers were actually put to death for their religion in New England, until an order from Charles II. brought this violence to a close. We commend these facts to the attention of the future students of the "origin and career" of Nonconformity, who will be obliged, we fear, if "sprung from the stock of the martyrs," to confess that they are also sprung from the stock of the persecutors.

Mr. Bright quotes with approval a highly characteristic passage from Macaulay—not perhaps the most unimpeachable witness on such a question—to the effect that "it is unquestionable, and a most instructive fact, that the years during which the political power of the Anglican hierarchy was at the zenith were precisely the years during which national virtue was at the lowest point." The reference of course is to the era of the Restoration, and, considering the abundant and obvious ways of accounting for the general demoralization of that age, quite apart from the influence of the Caroline bishops, the implied argument of *post hoc, propter hoc* will probably appear to those who approach the subject from a somewhat less onesided point of view than Lord Macaulay or Mr. Bright, closely akin to the typical fallacy of the old logic books, *Cometa fulsit, bellum erit*. At the period on which Mr. Dale especially dwelt the influence of the Anglican hierarchy was not at its zenith but at its nadir, as well from the dominant Erastianism of the time as from the indifferent character of too many of the Elizabethan bishops, to which Mr. Hallam calls attention, but which was of course chiefly the fault of those who appointed them. It was a time when the Queen was in the habit of treating her "proud prelates," whom she was fond of assuring that she could "frock or unfrock" them at her pleasure, in a way in which no footman would in this day endure to be treated by his master. Yet we fear, if contemporary authorities are to be trusted, "national virtue" was not then at a much higher point, in spite of the impotence of the hierarchy, than at the later period when their increased influence—which was partly due to their own much higher character—worked so disastrously, according to Macaulay, on the morals of the nation. And the persecution of the Puritans was at least as severe under Elizabeth as under Charles II. Nor does Mr. Bright seem to us happier in his estimate of the present than of the past relations of Churchmen to Dissenters. He is unable to conceive "why the Church should so dread, and hate, and despise Dissent," which entertains, we are left to infer, none but the most amicable sentiments towards the Church. But the only detailed evidence he adduces of this hatred and contempt does not strike us as very convincing. It seems that some years ago Mr. Bright met a clergyman from Warwickshire, who professed to be very liberal towards Dissenters, but, when asked why he did not occasionally attend the Dissenting chapel in his parish, "he fell back upon what he called his Orders, his Apostolical Succession"—a statement received with cheers and laughter by the audience. The joke is, however, scarcely obvious. Mr. Bright, as a Quaker, naturally looks upon orders, and sacraments, and Apostolical Succession as all moonshine, and nobody challenges his right to his own opinion on the subject. But why should not the Warwickshire clergyman have an equal right to his opinion, which happens also to accord with the teaching of his Church and the belief of the great majority of the Christian world? Or why should it be thought a conclusive proof of his narrow and bigoted hatred of Dissent that, after preaching to his parishioners in the morning, he does not feel called upon to go and hear the not perhaps very savoury truths which his dear Dissenting brother of Little Bethel may be desirous of impressing upon him in the evening? The position and attitude of the Bishops in the House of Lords is another question, on which we have no room to enter here, and moreover it is not, properly speaking, a question between Church and Dissent. There are Churchmen who agree with Mr. Bright in thinking that it would be better for the Bishops to be exclusively devoted to their spiritual work, and there are countries where the chief official representatives of episcopal and non-episcopal Churches sit side by side in the Upper House of the Legislature. But as the mere name of Bishops appears to produce on Mr. Bright very much the same impression as the sight of a red rag on a bull, it it is perhaps fortunate both for them and for himself that he is, to use his own phrase, "a product of Nonconformity," and need not therefore be brought into too close contact with the disturbing spectacle of lawn sleeves. However deplorable it may be that "the people of this country are parted into two great divisions, the Church and the Dissenters," it is surely as well, if they cannot unite, to let them agree to differ. That end will hardly be promoted by urging on Dissenters with varied and elaborate emphasis that, whenever they choose to trail their coat-tails, the Church may be trusted to tread upon them.

BURGLARS IN COUNTRY PLACES.

AMONG the public benefactors who relieve the tedium of country life burglars may surely claim a prominent position. When there has been no contested election, or colliery accident, or run upon a bank in a rural district for some years, the inhabitants naturally feel a want, and that want is well supplied by a burglar panic. Many ladies live in perpetual dread of robbers; but, although reports of recent burglaries increase their fears, they afford them a large amount of satisfaction. It is a pleasure to them to feel that it is not for nothing that they have looked under their beds for so many years and disturbed their husbands so often when they fancied that they heard that vague but terrible horror, "a noise." The laugh is now turned against the unbelieving male sex who formerly scouted the very idea of the much-dreaded robbers. During a robber panic the female element is decidedly in the ascendant, and the defeated sceptics are obliged to eat humble pie and buy revolvers at their gunsmiths. Above all, the hitherto unheeded victims of chronic terror have the intense gratification of saying to their husbands and brothers "I told you so."

In the depth of winter some country gentleman finds on returning home after a month's absence that mysterious footmarks had been noticed in one of the rooms. His sagacious butler had allowed a week to elapse before communicating with the police upon the subject, and after another day or two one of the rural constabulary had paid a visit to his house to investigate the matter. Over a friendly glass of beer in the pantry, the officer of justice had asked the butler his opinion on the subject, and that functionary had attributed the appearance of the footmarks either directly or indirectly to "them servant women," of whom he entertained a profound detestation. Finishing his second "half pint," the policeman observed that he thought so too. *Causa finita est.* The master, however, takes a different view of the affair; and after due examination of the case he comes to the conclusion that there is strong *primâ facie* evidence of a burglary having been attempted, and only frustrated by the disturbance of the intending thieves. But this opinion is to little purpose. The matter has been already settled in the pantry, and the police and the servants treat the views of the master with scorn. The superintendent assures him that the supposed robbers can only have been "followers," and pooh-poohs the whole affair. In a few days, however, news comes of a serious robbery of plate in a neighbouring rectory, and then the whole aspect of things is changed. The local papers announce the "Daring Robbery," and there is terror among ladies and servants. Before people have had time to get over their first alarm, another burglary is reported as having taken place at a house twenty miles off, and then another attempt is heard of at a place close at hand. A regular panic now sets in. People talk about little else but the burglars, and even men awaken to a sense of danger. Paterfamilias proceeds to put his house into a state of defence. He buys bells for his shutters, and revolvers for himself and his men-servants. He makes all kinds of arrangements with strings and wires which shall indicate the arrival of any nocturnal intruder. Truckle-beds are made up for the men in studies and libraries, and alarums are connected with door-handles. Gamekeepers and gamewatchers are told off for outpost duty, gardeners are placed as sentinels during the dinner hour—a proverbially dangerous time—and terriers, pugs, and poodles are carried off to bedrooms as protections by the ladies and gentlemen of the household. The gunsmith does a brisk trade in pistols, and the ironmonger displays a tempting thief-proof safe in his doorway. The wildest rumours are spread abroad of robberies which have never taken place, of deadly encounters which have never occurred, and of wholesale captures of burglars who are still at large. There are other stories in circulation which are more veracious. A servant who had been posted in a downstairs apartment with a double-barrelled gun was disturbed in his midnight slumbers by the sound of footsteps. Rushing to his window, which he opened, he observed a figure standing between two bushes at a few yards' distance. "Who are you?" said the servant; and receiving no answer, added, "If you don't speak I'll fire." In a few moments he discharged his gun at the legs of the figure, and when the smoke had cleared away and the male portion of the household had rushed to the rescue clothed in night attire and armed with firearms and clubs, it was discovered that the faithful guardian had shot a favourite pony in the legs. One gentleman had surrounded his house with wires which were tightened at a certain hour every evening and connected with spring guns. Contented with his security and oblivious of his ingenious defensive contrivances, he one night went out to see whether it was freezing, and while pacing about near his door he touched one of the treacherous wires, when there was instantaneously a terrific explosion close to his ear, and before he had fairly recovered from the surprise, he narrowly escaped receiving a severe blow on the head from a servant who had hurried to the spot on hearing the noise. Another gentleman who had taken no special precautions against thieves, on getting into bed, distinctly heard a steady filing going on in a room below. The stories of recent burglaries immediately flashed across his mind in their most ghastly form. Lacking a better weapon, he thrust the poker between the bars of the grate, while he bedecked himself in slippers, evening trousers, and a long dressing-gown of Oriental fabric. Looking out of the window, he perceived a faint glimmer from the room beneath, and the filing was more distinct than ever. Despite the entreaties of his wife, he sallied forth to the fray, bed-candle in one hand and red-hot poker in the other. On arriving at the door of the suspected room he could see the reflection of a light beneath the door, and on trying the handle found it locked on the inside. The filing, which had been proceeding very briskly as he reached the door, now ceased altogether. There was an awful pause of a moment's duration, after which, with true British pluck, he burst the door open with two mighty kicks—to find his butler sitting in his pantry engaged in decorative wood-carving. As may be easily imagined, that valuable servant thought that what a recent writer calls "the devil of Scripture" had come for him, when the gorgeously dressed figure of his master brandishing his fiery wand burst with a crash into his chamber.

There is, however, an aspect of a burglar-panic which is far from comic. When, after an hour's peaceful sleep, one is disturbed by one's wife, one's troubles begin. We ask what she is doing. "Listening" is her reply. The suggestion that she should lie down and go to sleep is snubbed by an authoritative but alarming "Hush." Nature asserts itself and we again doze, to be immediately awakened by the words, "I am quite sure I heard a noise." We offer to get up and take a walk through the house to see if any thieves are in it. "Oh, no, for goodness' sake don't do that," is the reply. Of course one gets a refreshing night's rest after this little episode. On another night, at two in the morning, one of the dogs is heard to bark. We look round, and finding all quiet, give it as our opinion that he must have heard the gamekeeper walking round the house, or that, if some thieves had come with burglarious designs, they have been certainly frightened away by his barking. His furious noise gradually subsides into occasional melancholy "yaps," until, after a dismal howl or two, he becomes silent. At last we drop off to sleep, but in a few minutes we are once more disturbed with, "My dear, there is that dog again." On one occasion there could be no doubt that a noise had been really heard, and we had been allowed to venture forth with plenary powers. After examining the lower part of the house we had taken a dark lantern, and had sallied forth and made a tour of the outside of the building. After a fruitless search for thieves and vagabonds, we had returned to our room, and had just settled down again with a satisfactory sense of our virtuous and gallant conduct, when we were aroused by a violent knocking at the front door and jingling of the hall bell. On going downstairs—we may observe that not one of the servants heard the deafening noise—we found two officious policemen at the porch, who had come with the valuable information that they had lately seen a man with a dark lantern walk round the house and enter it.

We must say a word about the houses which the burglars enter. A house is well furnished with men and revolvers, double-barrelled guns, and alarums. After a particularly comfortable and quiet night it is discovered by the housemaids when they go downstairs in the morning that it has been broken into. A piece had been cut out of a plate-glass window and the catch quietly opened. The shutters had offered but little resistance. All the drawers in the room were lying open. The silver tops had been removed from some inkstands, and a few odds and ends had disappeared. The door of the room first entered had been locked on the outer side; but a neat square hole had been cut in the panel by means of a large gimlet and a sharp knife, and through this hole some person unknown had quietly slipped his hand and turned the key. Then the other rooms downstairs have been searched, and some few things have been stolen; but, on the whole, little of value has been taken. The thieves have unaccountably missed things which would have proved rich booty. They have opened drawers in which were bags or purses of money without noticing them; they have walked off with plated goods which they evidently imagined to be silver, and have left massive silver ornaments which they probably considered too large to be real. Altogether, having one's house broken into, considering the risks run, seems oftener than not to be a comparatively harmless affair.

One day the exciting news is spread abroad that a burglar has been caught. Almost accidentally the poor man has fallen within the clutches of the police. It is a matter of good luck rather than cunning, but by some means or other he has tumbled into their hands, and is in the lock-up. There is immense delight and excitement among the inhabitants of the district. The thing is as good as a Cetewayo-hunt. The whole population crowd the square to catch a glimpse of the malefactor as he is taken from the lock-up to the police-court. Ladies sit on the bench to feast their eyes with gazing on the cause of their bad nights. The biggest policeman in the local force stands behind the culprit in the dock. An ordinary screw-driver, some large gimlets, and a chisel that were found upon him are examined with as much interest as if they were antiquities from Mitylene or the jade tools of our Aryan forefathers. In the prison the burglar cannot resist the temptation of inflicting a little chaff upon the country constables, a force for which he entertains a supreme contempt. It is a satisfaction to him to feel that his capture was owing to a mere accident, or possibly to the over-developed art of photography, and not to the exertions of the local police or to any careless or slovenly workmanship on his part. He is pardonably proud of his skill in his craft, and even when standing in the dock feels himself to be a hero. He is perfectly aware that the leading journals will give him a certain back-handed praise in describing his misdeeds, to say nothing of the glories of *The Police News*, and in his penal servitude he will reflect with pleasure upon his notoriety.

After the climax of the capture of the burglar, the panic subsides with wonderful rapidity, although the rest of the gang are still at large. Revolvers are allowed to get rusty, servants take little more trouble than before about fastening window or shutter catches, and ladies abstain (till the next time) from hearing noises in the small hours of the morning.

WASTE OF JUDICIAL POWER.

MISAPPLICATION and waste of power is always a thing to be deplored, especially when the power misapplied and wasted in one direction is urgently needed in another. The general who, having twenty thousand men wherewith to meet two hostile forces of nineteen thousand and one thousand respectively, should confront the larger force with only one thousand men and despatch the residue against the enemy's smaller body, would be justly regarded as a madman; while a contractor who set five hundred men to do the work of ten, and ten to do the work of five hundred, would not be likely to make his fortune. Such, however, are practically the tactics adopted with reference to the trans-

action of judicial business. There are eighteen judges on the bench whose office is to try Common Law and criminal cases, fifteen of these being judges, so to speak, of first instance, and three members of the Court of Appeal. When all these eighteen judges are at work in town, they have as much as they can do to keep pace with the business assigned to them. They have to provide for the Court of Appeal, three Divisional Courts, *nisi prius* trials in London and Westminster, Judges' Chambers, and the Central Criminal Court. At the present moment there are six hundred causes for trial at Westminster alone, besides arrears at Guildhall, in the Divisional Courts, and before the Court of Appeal. And yet, in the face of this pressing need, the metropolis is wellnigh denuded of Common Law judges. Fourteen out of the eighteen are away, one is ill, and three alone are left to do what they can against the ever-accumulating mass of London business. Of course they can do little or nothing. One sits steadily at Chambers, the other two constitute an occasional Divisional Court, or nibble at the cause list; while of these three, two have been lately requisitioned to conduct the Surrey Assizes, leaving for the time being one solitary judge to represent the whole Common Law staff at head-quarters. Such is the dearth of judges that an unlucky suitor who desired the other day to appeal against a decision of the judge at Chambers in a matter requiring speedy determination was fain to betake himself to the Court of Appeal in Chancery as being the nearest thing he could find to a Divisional Court of Common Law, where of course he met with the answer that the Court could do nothing for him. Here was an absolute miscarriage of justice—an appeal given by the law, and yet practically unattainable. The point in the particular case was, if we remember right, an application for a prohibition to a County Court, and, considering how exceedingly well County Court judges, as a rule, know and do their work, probably no substantial harm was done; but the question might have been one of "discovery" or some other of those intermediate proceedings which so often predetermine the fate of a cause.

So far at least as Common Law business is concerned, London is worse off now than in the Long Vacation, inasmuch as there is but one judge at Chambers, and a great deal more for him to do than could possibly arise between August and October, while the chance of appealing within a given time from a decision of that judge when it is obtained depends, as shown in the above instance, upon the assembling of a Divisional Court pretty nearly as uncertain as that which is supposed to meet in the Long Vacation. Moreover, there are the feelings of the suitors in London and Westminster to be considered. In the six hundred causes at Westminster alone there must be at least six hundred people who are either being kept out of their rights or have unfounded actions hanging over their heads, according as the plaintiff or the defendant is in the right—a not inconsiderable item of human inconvenience which ought to carry some weight; and, unfortunately, the two judges who might have done something, however small, towards alleviating this block, both found themselves at the outset involved in well-nigh interminable cases, which occupied many days and prevented any appreciable impression being made on the list. Where is the golden promise of the Judicature Acts as to continuous sittings in London and Westminster? Gog and Magog are the sole tenants, for aught lawyers know, of Guildhall, and day after day the law notices for Westminster consist of little or nothing beyond the ominous announcement, "The Court will not sit in banc to-day," "There will be no *nisi prius* sitting of the Court to-day."

Of course, if it could be demonstrated that the absent judges were well employed elsewhere, there would be no fair ground for complaint, and Londoners would have to put up with the inconvenience they suffer; but the assize reports go very far to prove that a waste and misapplication of force is taking place which is but slightly exaggerated by the imaginary illustrations we adduced at the outset of this article. The eighteen absent judges were despatched a month or so ago on the full winter circuit; that is to say, the assize town in each county of England and Wales has to be visited by one, or, in the large majority of cases, two judges, for the trial of such prisoners as may be found there, and such causes as may be entered there. To receive these judges with due honour as Her Majesty's representatives, the whole array of high sheriff, undersheriffs, chaplain, trumpeters, state carriage and horses, coachmen and footmen, has to be in readiness at each assize town, and fitting lodgings must be prepared for them under pains and penalties. Each judge has, for his part, to transport his personal staff with him, while the nation, at a cost of 75*l.*, considerately supplies him with a marshal to bear him company. Now the least that could be expected is that these elaborate preparations should not be wasted, that this complicated machinery should not be set to grind wind. Yet, at a very large proportion of the assize towns this circuit, this has practically been the case. There is, unfortunately, no possibility of ascertaining, at the time the circuits are fixed, what amount of business is likely to present itself at each place; and it is perhaps too much to expect that persons will commit crimes or institute actions for the sole purpose of affording employment to Her Majesty's judges of assize. Anyhow, the assize reports present a lamentable series of covers, so to speak, drawn blank, or nearly so. To cull but a few from the numerous instances; at Aylesbury there were no causes, and only two prisoners; at Bodmin the whole business, civil and criminal, was over by half-past four the first day; at Huntingdon there was one cause, and one criminal charge in which the grand jury threw out the bill; Nottingham afforded two criminal cases only; at Oakham and Welshpool there was nothing whatever for the judges to do, while in many other places one or more days had to be passed by one or both of the judges in enforced idleness. The culminating absurdity was reached at Beaumaris. There was only one prisoner to be tried there, for a trifling offence, and he was by chance imprisoned at Carnarvon, where the assizes had just concluded. There was nothing for it, however, but that the judge, with all his following, should cross the Straits, taking the solitary culprit with him, and, with the assistance of the Anglesey high sheriff, grand and petty jury, hold a solemn court at Beaumaris for the trial of this one man.

Judges are, as a rule, a long-suffering body, and consider themselves bound in ordinary circumstances to do as they are told, and to carry out their instructions without questioning the wisdom of those instructions. But it fell to the lot of Mr. Justice Stephen to have to go through the solemn farce of opening the Commission at Oakham on the occasion above referred to, and the righteous soul of that most conscientious judge was vexed at the absurdity of his own position, and the anomaly of his being where he was not wanted instead of where he was wanted; so that, having nothing else for himself or the Grand Jury to do, he could not refrain from expressing to them his views on the present state of affairs. As his remarks have already been before the public, there is no need to recapitulate them at length. In substance they were to the following effect. Up to 1876 there were two annual circuits, one in the spring and the other in the summer, at which civil and criminal business was transacted at every assize town throughout England and Wales. A winter circuit also existed almost exclusively for criminal cases, which was only held in counties where there were a sufficiency of prisoners to make it worth while. This was found to weigh heavily upon persons ill-advised enough to commit serious offences in unimportant counties, inasmuch as, to use Mr. Justice Stephen's own illustration, a man charged in August with committing murder in Rutland might have to lie in gaol till the following March, though he might be ultimately acquitted. To remedy this grievance an Act was passed in 1876 empowering the Crown to take steps to amalgamate counties into assize-centres for the purpose of the winter assizes. By reason of the economy thus attained the Legislature saw its way to affording another criminal assize in the autumn, and in 1877 an Act was passed authorizing a similar grouping in the months of September and October. Finally, in 1879, another Act was passed providing for the same amalgamation at the spring circuit, provided that in any case assizes should be held in each county twice a year. On account of this proviso and on account of the above-enumerated Acts applying only to criminal business, it has been the practice to consolidate the assizes on the spring and autumn circuits, and retain them in their original form for the summer and winter circuits. The experience, however, of the present winter circuit seems to point to the necessity for some further remodelling of the system. Mr. Justice Stephen suggests a remedy. "Apply," he says, "to all the circuits, and to both civil and criminal business, the principle of the Winter Assize Acts." He pointed out how a short Act embodying this principle would rid the Statute book of three superfluous Acts, and at least tend to obviate such anomalies as maiden assizes. If a tendency in the opposite direction developed itself, and the agglomerated criminal business of several adjacent counties assumed inconvenient proportions, the difficulty might be met by a rectification of the present somewhat unscientific frontier of the respective jurisdictions of assizes and sessions, which should reduce the work allotted exclusively to the former tribunals. We do not altogether advocate any extension of the jurisdiction of sessions as at present constituted. The existing list of offences triable at sessions contains quite as many serious offences as it appears wise to submit to the adjudication of bodies, many of which do not include a single member possessed of special legal training. But, as we have said, the classification of offences into those triable at sessions and those not so triable is arbitrary, and very possibly a re-classification might be accomplished, which, together with the adoption of a scheme for holding the sessions immediately before the assizes, would keep within reasonable limits the criminal work to be got through on circuit. With regard to the civil business, the statistics of the present circuit would seem to afford a reasonable expectation that, even lumping two or three counties together, the judges would be competent to cope with any number of causes likely to be submitted to them, especially if, as Mr. Justice Stephen appears to suggest, civil business were to be taken at all assizes, so as to avoid accumulation. Moreover, civil business on circuit frequently includes causes which have no earthly connexion with the county in which the assize is held, the venue being laid in that particular county for the convenience of the plaintiff or of both parties. Judges frequently complain of this abuse of the circuit system as a hardship upon county jurors, who have to sit and hear cases not legitimately within their duties; and a reformation in this respect would effect a saving of time on circuit, while redressing a wrong of which county jurors are justly intolerant. Then the continually advancing jurisdiction of County Courts has eat largely into the materials of assize causes, and from all accounts is likely to do so still further. Finally, the facilities of railway travelling are such that after all it is not such a very great hardship if suitors are gradually brought to look to London as the main seat of justice. Save for the Palatine Courts, all Chancery cases have to be tried in London, and though there is a difference between them and Common Law trials, inasmuch as the attendance of the parties and their

witnesses is not so invariably required in the former as in the latter, the difference is not now one of so vital importance as in the days when a journey to the metropolis was a matter of considerable expense and risk. If fewer judges had to be told off for circuit duty, and if those judges were enabled to get through their work without waste of time, there would be more left to get through the cause lists in town, and the main source of expense to country suitors who bring their cases to London—namely, the maintenance of themselves and their witnesses while waiting for the cause to be reached—would be to a very great extent avoided. At any rate the experiment suggested by Mr. Justice Stephen seems worth trying, if only to obviate the recurrence of such absurdities as have taken place this circuit, and which must tend to bring the administration of justice into ridicule. The proposed Act might be worked, like the existing ones, by means of Orders in Council, which could be issued for specified periods only, and thus, if the experiment proved unsuccessful, the old method could be reverted to without the necessity of fresh resort to Parliament.

ST. JOHN OF RYLO.

II.

THE precise date of the foundation of the monastery is uncertain; but it was towards the end of the tenth century, and during the reign of the warlike Simeon, son of Boris, the first Christian among Bulgarian monarchs, that St. John, afterwards named of Rylo, but born of village parents on the plain of Sofia, being dissatisfied with the ordinary routine of the priestly life which he had already embraced, betook himself in quest of higher things to a life of absolute seclusion and uninterrupted prayer in the mountains. The exposed and easily ascended slopes of Vitos—too near, also, it might be, to his native hamlet of Skrino—not affording the retreat he desired, the future saint sought and found a securer concealment among the crags and forests of Rylo; and there in a cave, not far distant from where the monastery now stands, he passed twenty years, his existence unknown to all except to a pious shepherd who supplied him with his daily bread through a rift in the cavern roof. The grotto has since been changed into a chapel, where a monk, who lives ensconced in the rock close by, officiates; pilgrims often visit the spot, and revere the stone-hewn sarcophagus in which the body of the saint is said to have made its first resting place after death. Quitting the cave, for whatever reason, St. John next took up his quarters in a hollow tree; this, too, after a time, he left, and passed the last seven years of his life on the summit of the precipitous rock that overhangs the monastery of his name. Towards the close of his life the fame of his sanctity, amply attested by the customary miracles of hagiographic legend, spread far and wide, till it attracted the Czar Peter himself, son of Simeon, to pay him a visit in person. Not long after, in the year 946, he died, having, in spite or in consequence of his austerities, attained seventy years of age, and eclipsed every ascetic competitor—and of such there were many during the first fervours of Bulgarian Christianity—not merely in the wonders, but still more in the abiding results, of his long career.

Even during his lifetime numerous disciples, amongst whom the most renowned was the young Lucas, a very popular saint whose relics are venerated in a small mountain chapel near the hermitage of his master, had gathered round him; and it was not long before the monastery into which they coalesced obtained the acknowledged primacy among all other national Lauras, and, by a natural result, drew pre-eminently to itself the devotion and the wealth of Bulgaria and her kings. Asen II., the most powerful monarch of the third, or Bulgaro-Wallachian, dynasty that reigned at Tirnova, with his successors, vied in munificence towards the holy place; nor were the monks of St. John wholly undeserving of the bounties they shared. Fifty zealous preachers, sent forth from their mountain cloister in yearly succession to every town and village of Bulgaria (a denomination in which Thrace and Macedonia were then included), maintained the national faith in something of its primitive steadfastness against the conjoined attacks of Latins, Paulicians, and Islam; while a goodly number of subsidiary convents, some of which, in the plain of Sofia, exist to this day, owed not only their foundation, but their maintenance, to the parent monastery of St. John of Rylo. It was at this time that the heroic Relza, lord of the Strymniza province, and alternately rebel and vassal to the Servian monarch Stephen Dushan, after a long and brilliant career of arms, abandoned his princedom for ascetic quiet within the holy walls, where he constructed, it is said, the tower and chapel that yet bear his name, and died a monk in the habit and discipline of the Bulgarian brotherhood.

Half a century later this very tower, with its ribbed walls of massive stone, was all that remained of the monastery of St. John; the rest of the edifice, then not improbably in great part of wood, had been consumed by fire, and the monks butchered by the soldiery of Sultan Bayazid. But after another half-century of desolation, the ruins were visited by three brothers of noble family—Joseph, David, and Theophanes—who left their native home at Krupnik in Macedonia to assume the austerities of hermit life, where St. John had first set the example. Gradually others joined them, till, nearly seventy years after its destruction, the monastery was formally reconstituted by a firman obtained, tradition says, through female influence from Mahomet II., and was reconsecrated by the timely presence of the relics, genuine or supposed, of St. John himself, brought back with solemn pomp from Tirnova, where they had long lain neglected among the ruins of the patriarchal cathedral, and now at last replaced in their proper sanctuary. Each stage of the procession from Tirnova to Rylo is faithfully chronicled in Bulgarian annals; and the halting-place where the bearers rested with their sacred charge on the final mountain ascent, is yet marked out by popular veneration; while the Feast of the Translation of St. John of Rylo, which coincides with that of the Apostles Peter and Paul, is a favourite day of pilgrimage to the shrine of the national patron.

That shrine is now enclosed within the walls of the stateliest church Bulgaria can boast; a church worthy both in dimensions and style of the great monastery it adorns. The length of the building, which stands isolated in the midst of the quadrangle, is a hundred and thirty feet, exclusive of the wide open-arched portico that surrounds it on three sides; the breadth of the nave is a little over sixty feet; the extreme height from the pavement to the cross that tops the central cupola, about eighty. The portico, a graceful arcade constructed of various-coloured marbles hewn in the neighbouring Balkans, shelters the curious fresco paintings with which the outer walls of the church itself are decorated or defaced. One series represents to the gazing pilgrim crowd the life and miracles of the Saint and his disciples; here St. John supplies the defects of the Bulgarian commissariat by miraculously feeding his country's helmeted defenders; there he is no less miraculously fed himself; here he expels demons; there he holds converse with kings; another series exhibits the various seductions of wicked demons, tempting men, women, and even children to sin—the devils very varied and hideous; the joys of Paradise, the terrors of the Last Judgment, the tortures of Hell, all portrayed in the most materialistic imagery, form a third series; while a fourth reproduces the principal parables of Gospel record. One group in particular, that of the Angel of Death requiring the rich man's soul from him at an hour's notice, is considered the masterpiece of the entire collection—it is certainly the biggest. The colouring, it need hardly be said, is throughout better than the drawing; but the latter, even when at its worst, displays a certain freedom of touch and a creditable attempt at realism in form and perspective, which suggest, with time and study, a possibility of artistic improvement wholly absent from the stereotyped symbolism of the Byzantine school.

The interior of the church deserves less qualified praise. Slender marble columns, supporting arches of bold span; light judiciously supplied from above; a roof vaulted into five shapely cupolas; breadth well balanced by height, and strength combined with grace—such are the distinctive features of a building constructed wholly by Bulgarian architects, themselves simple village craftsmen and disciples of no school except that of utility, good sense, and a strong innate feeling for design and ornament. The system of these builders was the same that, to quote Mr. Fergusson in his well-known work, "prevailed since the art first dawned, in Egypt, in Greece, in Rome, in Asia, and in all Europe down to the sixteenth century"; and it had here the same successful result as elsewhere. It is a system destined, there is too much cause to fear, soon to pass away from Bulgarian architecture before the contagion of European imitation and the demon that whispers "Have a taste"; before the apings of sham Classic, sham Gothic, sham Byzantine, and whatever else the models of Paris or Petersburg may supply. But should Bulgaria, true to her unbroken traditions, content herself with cultivating her own native store of constructive and decorative skill, she may yet achieve the task of solving the problem which has long baffled alike Turk and modern Greek, that of how to adapt the laws of architecture, taken in its wider sense, to the exigencies of modern thought and life under the sky and amid the climate and scenery of the Balkan Peninsula.

Inside the church the wood-carving of image-screen, pulpit, and stalls—imitative almost exclusively of fruit and foliage—is in the best style of Bulgarian workmanship, though the gilding with which it is covered detracts somewhat from the effectiveness of the execution. But, indeed, there is scarcely a square inch throughout the whole wall-surface of the interior that is not either overlaid with gilding or bright colour. In front of the Iconostasis, a wooden chest, covered with a pall of embroidered cloth, contains the relics of the patron saint, rarely exposed to view; a few votive offerings—silver candlesticks, lamps, censers, and pictures by Roumanian or Russian artists—are placed close by. The pavement is of variegated marble; a huge round slab placed under the span of each cupola bears the name of one or other of the mason architects, else unrecorded, whose joint labour reared the building. The date of its completion was 1844.

Near the church and also within the monastery court stands the square stone tower often, though erroneously, called after the Servian monarch Stephen Dushan, during whose reign it was erected by his tributary chief or vassal, the Macedonian Relza. Outside, the tower is fluted with lancet-formed bays, three on each side, and crowned with a machicolated parapet; the low door that gives entrance to the interior is placed at a considerable distance above the ground, so as to require the help of a wooden stair or ladder from without—no unusual precaution in buildings of early date. Within, the tower is divided into seven stories, the lowest of which formerly served, and may yet, it is said, occasionally serve, as a prison for conventual ill-doers; it is a dark oubliette worthy of a mediæval castle; above this four successive stories,

each consisting of a single room with narrow loopholes in place of windows, tell of defence rather than of comfort. Evidently it was a tower of refuge in the intention of the builder, but one that could not have held out many days. The uppermost story but one is partitioned into two rooms, and enjoys a more liberal allowance of air and light; it may have served as a dwelling-place for the old ex-warrior monk; above it is a small stone chapel surrounded by a low gallery; here Relza, tradition tells, performed his daily devotions. No contemporary inscription or carved symbol tells of person or date; an omission unfortunately common throughout the whole of Bulgaria, where the very Turkish tombstones, the most unfailing, if not the most trustworthy, recorders elsewhere, are almost always blank. It is not easy to say why it should be so. On the contrary, a mania for inscriptions has seized on the country of late years, and there is scarcely a fountain, an arch, a lodging-house, or even a common dwelling of recent construction, that does not bear its date; a symptom of awakened self-consciousness that has in it a promise of the future.

On the further side of the quadrangle a low postern gate, well furnished with iron-plated doors and bolts, gives egress on a little hamlet made up of the abodes of the convent-guards, of servants, farm-labourers and other dependents; here, too, are stables, cow-houses, sheds for lodging pilgrims who may on crowded festivals be unable to find room within the main building; besides great store-rooms for fuel during the long months of winter, which may be reckoned here at an average as over half the year. Yet, in spite of the great elevation, the cold, though long in its duration, is seldom intense, thanks to the towering peaks and dense woods that screen the glen; but the snow-falls are heavy, and often cut off all intercourse with the nether world for days and even weeks. Beyond these huts a shaded wood-path leading along the edge of the ravine conducts to a sort of Belvidere, whence a view of rare beauty reaches up and down the gorge; the forest foreground is walled in by precipitous rocks and splintered crags of gigantic size, while beyond and above them snow-covered peaks stand out on every side against the violet sky. A foot-track winds up to the left among trees, torrents, and boulders to the pretty little hermitages of St. Lucas and St. John; the horse-path follows the ravine through beech and pine, till at a height of more than six thousand feet it crosses a bare ridge, and thence descends northwards, by steep rocky passes and wide ravines that recall the scenery of the Grisons or Tyrol, till it reaches the bleak plain of Samakow and the Isker. This pass is generally blocked with snow from eight to nine months in the year.

The neighbourhood of the monastery abounds in game; deer, elk, bears, and chamois stock the mountain, unmolested except by a few huntsmen from among the convent-guards, or the villagers of Samakow. No professional Tyrolese sharp-shooter could desire a better ground for his skill; nor need he as yet fear much from native rivalry in this pursuit, the Bulgarian sportsman being at present only an undeveloped possibility. Nor is the peculiar interest afforded by volcanic action wanting here. The monastery is frequently shaken by earthquakes that have from time to time imperilled even its strong construction; and six years since a rift opening among the peaks that overlook the valley widened and deepened rapidly into a kind of crater whence smoke, accompanied at first by an eruption of heated stones, was discharged for several days; and which still gives vent to steaming vapours that melt the fallen snow for some distance round.

WOOD-ENGRAVING IN AMERICA.

SOME little while ago we found occasion to remark upon the exceptional excellence of American woodcuts. The American engraver, it was observed, had acquired in the practice of his art a degree of delicacy and refinement scarcely attempted by the engravers of this country, and rarely equalled even by the most skilful craftsmen of the Continental schools. He had, in fact, as we pointed out at the time, given to the resources of his art a new direction and a larger development. In the determined effort to reproduce the original work of the painter or the draughtsman with as little sacrifice as possible, he had greatly enlarged the means at his command, and had discovered richer and more varied modes of expression. The justice of these observations will, we think, be readily acknowledged by all who are familiar with the admirable wood-blocks published from month to month in the American illustrated magazines. Many of these blocks are executed with a fineness of artistic feeling and a subtle power of manipulation which few English engravers could hope to equal; and, what is no less remarkable, they are printed with an amount of care and finish such as, under similar conditions, would be altogether unattainable in this country. But, although the general excellence of American wood-engraving is widely acknowledged, there is, it would seem, considerable difference of opinion as to the value of the recent development of the art to which we more particularly directed attention. Our favourable criticism, reproduced in the current number of *Harper's Magazine*, has been made the text of a series of short essays, contributed by several of the principal American engravers; and in those papers, which are chiefly interesting by reason of the practical knowledge possessed by their authors, the present aims and resources of the art are thoroughly discussed. Nearly all the writers belong more or less to what may be called the new school of wood-engraving. To the work they produce, therefore, our comments more particularly apply. But the value of their efforts for the advancement of the art has lately been called in question by an older professor of the craft, who has himself exercised a very considerable influence upon the progress of American engraving. Mr. W. J. Linton, whose hostile manifesto was published some little time back in the *Atlantic Monthly Magazine*, is by birth an Englishman, but he has been for many years resident in America, where his skill as an engraver is warmly appreciated. He would seem, however, to be very little satisfied with the progress made during the last few years. The liberty which many of the younger men allow themselves, he is disposed to denounce as a license unwarranted by the inherent laws of the art; and he regards the recent attempts that have been made to reproduce the varied effects of tone and colour, and to imitate the different modes of execution in pen, brush, or charcoal, as a waste of time and a wanton perversion of skill and labour. It would take long to follow Mr. Linton in all the details of criticism, nor is it necessary for our purpose to do so. His general position in regard to the capabilities of the art may however be clearly and briefly stated. He starts with the principle, which no one, we suppose, would be inclined to deny, that the mode of execution in wood-engraving must be governed by the practical conditions under which the engraver has to work. But to this principle he attaches a particular limitation. An engraver, in his judgment, has no right to attempt to imitate the effects proper to another art; and he thus banishes altogether from the realm of legitimate art all kinds of facsimile engraving where the block is cut in such a manner as to imitate the effect of a drawing executed with the pen. If an engraver is set to reproduce a picture or a drawing, no matter what may be the material employed by the original artist, the result must be made to conform to an established rule of practice, determined, not by the character of the particular subject, but by the fixed and rigid principles of the engraver's practice. The original, in short, is to be translated, and not copied. The engraver, if he is true to himself, must proceed as though he were making a direct study from nature; and, while he preserves the broad facts of the artist's design, he must abandon all attempt to reproduce those qualities which indicate an individual style of execution or particular effects of surface and material.

It may be observed that Mr. Linton stands by no means alone in the view which he holds concerning the proper functions of wood-engraving. The principles so energetically enforced by him in the paper to which we have referred are also ably defended by Mr. Henry Holiday in a study of the subject recently published in the *Magazine of Art*. To do justice to the unquestionable truth which underlies their argument we must keep in mind the particular aspect of the question to which they mainly address themselves. In so far as wood-engraving can be regarded as an independent means of artistic expression, the conclusions they seek to establish may be said to be almost incontrovertible; for it is evident that the distinction so often insisted upon between the processes of wood-engraving and the processes of etching or engraving on copper suggests a very important difference in the manner of working. To realize the full force of this distinction we must remember that, whereas the copper-plate prints from the incised line, the wood-block prints from the relief. In the one case, therefore, the artist actually cuts his design as it will ultimately appear upon the paper, while in the other he cuts away all that is not required for his design, and the printed impression is taken from what remains. It is this fact which leads Mr. Linton to declare that all true wood-engraving is produced by the use of what he terms the white line. The surface of the untouched wood-block is represented upon paper by an even tone of deepest black, and upon this dark mass the design has to be indicated by a process which may be said to resemble that of mezzotint-engraving. If, therefore, we suppose the case of an artist working directly from nature upon wood, we may readily acknowledge the method advocated by Mr. Linton and Mr. Holiday to be the most appropriate to the means at his disposal. But, as a matter of fact, wood-engraving has very rarely been used as a means of independent expression, and, with one or two exceptions, belonging to a comparatively recent date, nearly all wood-engravers have been employed in the reproduction of designs already executed in another material. The considerations which have determined the choice of this particular process are of a practical rather than of an artistic character. The wood-block offers the readiest and the most convenient mode of multiplying copies of a design, for it can be associated with ordinary type, and the impressions can be struck off in the printing press without any further expenditure of time or labour. A finished wood-block is, in fact, nothing else than a picturesque arrangement of type, and there would seem to be no better reason for insisting upon the use of the white line in the treatment of a picture than there would be in the demand that books should be printed in white letters upon a black page. Mr. Holiday, however, is by no means disposed to admit this account of the wood-engraver's art. According to his contention, the processes suggested to the engraver by the character of his material have a profound correspondence with the truths of nature. "A little observation," he declares, "will show us that nature, as a rule, exhibits objects light on a dark ground"; and he accordingly concludes that the greatest advantage is offered to an artist by a process "in which lights are taken out with the greatest ease, in which the objects are drawn with light instead of being drawn with darkness." But, if this were true at all, it would hold good as well for the draughtsman as for the engraver; and we might therefore expect

that drawings would, as a general rule, be executed with white upon black paper. But, as a matter of fact, such a principle has never been widely accepted even by engravers upon wood. If we are to reject all woodcuts which are not executed according to this system, we shall have to put aside as illegitimate nearly the whole of the work produced in this kind previously to the days of Bewick. For, if we examine the earlier woodcuts from the designs of artists like Albert Dürer and Holbein, we shall discover that they are open to the reproach which it is now sought to attach to all kinds of facsimile engraving. It is true that the lines in which these artists expressed their ideas were comparatively few in number and of simple character; but they were just such lines as a draughtsman would employ in the ordinary practice of his art. They were in no way specially devised to meet this rigid theory of the legitimate province of wood-engraving; nor do we think that students of art will readily acknowledge the justice of a principle which deprives them of the admirable woodcuts of this earlier time, and leaves in their stead nothing but a handful of designs by Bewick and his followers.

But when the propriety of facsimile engraving is once admitted, the accusations brought against the younger school of American engravers will be found to lose all their force. Their practice is nothing more than a development of a principle that has been tacitly acknowledged since wood-engraving has been in existence; and as the earlier workmen strove to reproduce faithfully the simple lines of the designer, so they now endeavour by greater variety of method to copy exactly the effect and colour of the original drawing. The degree of success which they have attained can only be judged by reference to particular examples; but their efforts would certainly have borne very little fruit if they had allowed themselves to be hampered by the pedantic rules which Mr. Linton and those who think with him now seek to impose upon the art. How much they have gained by the freedom they have enjoyed is sufficiently shown in the series of selected engravings recently issued by the publishers of *Scribner's Monthly Magazine*. In these examples the resources of wood-engraving are applied to the reproduction of nearly every mode of artistic expression. The guiding principle that may be said to characterize all the work of the school springs out of a single desire to preserve the character of the original drawing, and with this object steadily in view, the engraver has permitted himself to make use of devices which are often inconsistent with the conventional kind of execution hitherto employed. That these devices are in many cases experimental is frankly acknowledged; but no one who studies the blocks attentively can fail to perceive that such experiments have been the means of enriching the resources of the art. The engraver seeks in each individual case to adapt his execution to the particular character of the work before him. He tries to preserve not merely the general effect of the design, but the particular manner in which it is expressed, and in this way he discovers new capabilities in the practice of his own craft. Now and then this endeavour to do justice to the original artist may possibly result in failure; but the failure is more than counterbalanced by the general advancement of the school, and by the stronger impress of personal sentiment which is gradually introduced. Each individual engraver begins to acquire and to develop a system of his own, by which he is enabled to infuse into his work a new sense of vitality, and to claim for it a kind of attention and interest such as could never be claimed for the strictest obedience to a rigid rule of procedure.

IMPROVEMENT IN THE COTTON TRADE.

THE improvement in business has at length undoubtedly extended to the cotton trade. With the exception of iron and coal, no industry in the country perhaps has suffered more severely from the long depression. The numerous strikes in Lancashire, the ability with which the case of the men was supported by their advocates, and the serious riots at Blackburn have all made the general public aware of this. Yet, after all that we had heard and read on the subject, we were not prepared for the statement made by Messrs. Ellison in their review of the trade for last year. They say:—"It is certain that, if a change for the better had not taken place before the close of the year, half the spinners and manufacturers of Lancashire would have been ruined." And in support of this startling assertion they offer the following estimate of the losses of manufacturers during the past four years. 1876, 3,289,000*l.*; 1877, 4,213,000*l.*; 1878, 5,599,000*l.*; 1879, 6,024,000*l.*; making a total loss in four years of 19,125,000*l.* In addition to this, they estimate a reduction in wages of 1,323,000*l.* in 1878, and of 3,307,000*l.* in 1879, being a total reduction of 4,630,000*l.* Adding this reduction in wages to the losses of manufacturers, we get a total loss to the trade in four years of very nearly 24,000,000*l.* It will be understood that in this estimate there is not included either the money thrown away in strikes or the money which might have been earned, but was not, while mills were closed or running short time. In other words, it is an estimate of the actual losses of capital by manufacturers, and of the actual losses of earnings on work done by operatives. How far it may be accepted as correct we are, of course, unable to say. Messrs. Ellison are recognized as the highest authority in the trade on questions of the production and consumption of cotton, the producing capacity of the various countries of the world, and so on. They are likely, therefore, to have verified the figures, as far as it is possible to verify what in their nature can be but an approximation to the truth, before giving them to the world. And it must be added that they support their calculations by the last year's balance-sheets of the Oldham Companies. Fifty-five Companies, they tell us, showed on balance a loss of 155,830*l.*, and seven a profit of 4,713*l.*; the net loss was thus 151,117*l.* Of this net loss about 100,000*l.* was incurred last year, and the loss of profits raises this capital loss to about 210,000*l.* Assuming that the losses elsewhere were proportionate to those of the Oldham Joint-Stock Companies, we arrive at an aggregate loss of capital and profits only about three-quarters of a million less than Messrs. Ellison's estimate. It will be seen that here Messrs. Ellison include profits not earned; but these clearly ought not to be reckoned. Every manufacturer, of course, works in the hope of making profit; but it is not necessary to his success, or even to his continuance in business, that he should realize the hope every year. If on the average of years, setting good times against bad, he earns average profits, that is enough. A cotton-spinner would not be poorer at the end of 1879 than at the end of 1878 if he retained his capital intact. It is only the diminution that capital has undergone which ought to be included in such an estimate as we are here considering. On the other hand, the estimate does not take account of the losses suffered by mill-owners who were obliged to sell their mills at a heavy sacrifice because they were unable to keep them open, or of the depreciation undergone by the shares of cotton Companies. In any case, whatever correction may need to be made in Messrs. Ellison's figures, they show that the condition of the cotton trade during the past four years has been indeed calamitous.

The depression reached its extreme point in the spring of last year. After that there was a recovery, which, after several fluctuations, became undoubted in the concluding quarter of the year, and is still gaining strength. The revival would have been quicker and more considerable but for the dearness of the raw material. The cotton crop of 1878 was smaller than had been supposed, and although after the Glasgow Bank failure the price of raw cotton fell to an unusually low level, it began to advance as soon as buying increased. The difficulties of the manufacturer were thus aggravated. He was not able to get more for his goods, and yet he had to pay more dearly for the raw material. Gradually, however, the situation improved, and the prices of both cloth and yarn advanced considerably. Yarn was the first to move, and for a considerable time spinners were doing well, while manufacturers were no better off than before. But cloth, as we have said, has at length shared in the improvement. At the beginning of 1877 the margin of spinners' profits—that is, the difference between the price of raw cotton and that of yarn—was 4½*d.* per pound; it fell continuously, until at one time last year it was as little as 2½*d.* per pound. Last week it had risen to 4½*d.* per pound. We have here statistical evidence of the great improvement that has taken place. As regards the cause of this improvement in spite of successive bad harvests, perhaps the explanation offered by Mr. Giffen in his review of the trade of last year in the Supplement of the *Statist* is the most satisfactory. His theory is that production had actually fallen below the consuming power of the country in the early part of last year. The depression had lasted so long, had reduced prices so inordinately, had led to the stoppage of so many factories of all kinds, and to the working of so many others on short time, that the supply of commodities was exceptionally restricted. The failure of the Glasgow Bank, and the several suspensions to which it led aggravated this state of things by paralysing credit. For eight or ten months afterwards nobody knew whom he might trust, so complete was the shock to the confidence on which commerce rests, and so general were the rumours of financial embarrassment. The banks refused to give their usual accommodation to their customers, and insisted, where they could with any success, upon the credits they had previously granted being lessened. Manufacturers refused to part with their goods except for cash; and wholesale houses acted in the same manner in their dealings. When it is borne in mind that this extraordinary contraction of the volume of business took place after four years of very great depression, during which strikes, failures, and the continuous decline of prices aided the falling off in the demand both at home and abroad in impressing upon manufacturers the prudence of limiting their operations, it will not appear improbable that production may have fallen behind consumption. But if this be so, a revival was inevitable in the absence of some great calamity. It is a fundamental law of political economy that when demand outstrips supply, prices must rise. But a rise of prices would at once encourage manufacturers to make good the void which their discouragement had previously occasioned. And a general rush of buyers is the very thing to restore that confidence which is the soul of trade. It is of course true that last year's bad harvest was a calamity which went far to neutralize the effect of the causes tending to produce greater activity. But, on the other hand, the extraordinary prosperity of the United States, prompting an immense increase of American purchases in this country, gave a new impetus to the trade movement. The influence of these American purchases in diffusing a more hopeful spirit can hardly be exaggerated.

Whether this theory of Mr. Giffen's be correct or not, it appears from a circular of Messrs. Smith, Edwards, and Co. of Liverpool, that the home demand for cotton goods has very considerably increased, and has continued good all through last month. The

new prosperity of the iron and metal trades generally, of mining, shipbuilding, and other important industries, by giving the workpeople increased purchasing power, accounts for much of this improvement. But when the agricultural distress is borne in mind, and also the rise in the price of raw cotton, enhancing the cost of cotton goods, it is difficult to resist the conclusion suggested in the review referred to, that in fact the stock, not of cotton only, but of commodities generally, had run short last year. The foreign demand has increased as well as the home; and, what is more important, the Board of Trade returns for last month show that this increased demand has been general. It has been asserted very confidently and very frequently of late that American competition in cotton was undermining our position in the Eastern markets. So far, however, is this from being the case that, on comparing last month with January twelve months ago, we find a marked increase in the exports of cotton to the United States. We also find a much better demand in the South American countries. The depression from which we are recovering originated in the raw-material-producing countries, and in them has been most severe. The South American States, for example, have suffered intensely. But they have now been favoured with good harvests, and they are once more in the full swing of prosperity. On the Stock Exchange, as we noticed last week, their securities are dealt in largely at higher and still higher quotations; and they have begun to buy from us more freely cotton and other commodities. But most important of all are the augmented exports to the East. During the great strike in North and North-East Lancashire, the masters published a statement in which they showed that it is to the East we must look for the future growth of the cotton trade. The exports of cotton to the Continent have practically remained almost stationary for twenty years, but those to the East have increased enormously. And when we consider the immense populations of those Eastern countries, we see that the capacity for further expansion is almost limitless. Of late years terrible famines in both India and China checked very seriously the power of the people to buy clothing. But these dreadful calamities have now happily ceased; and accordingly we find a great increase in the exports to the two Empires just named, and also to Ceylon, the Straits Settlements, Japan, Java, and the Philippine Islands. As regards India more particularly, we see last month a large increase in the exports to each of the three Presidencies. In conclusion, we thus find that the improvement in the trade has been continuous for some months, that it extends to all branches, and that it is based upon an increased demand both at home and abroad, the foreign demand, too, being very general.

THE CARL ROSA COMPANY IN *LOHENGRIN*.

HERR WAGNER'S *Lohengrin*—the first of his works in the form of a "music drama"—was produced at Her Majesty's Theatre on last Saturday night, after having been announced some ten days before and postponed. This has been one of the most interesting productions of the whole season; for, if we do not mistake the meaning of the composer, he asserts that in "music drama" every element—words, music, acting, singing, and stage arrangement—ought to be of equal importance. As yet, perhaps, even the most fervid of his disciples are rather inclined to think that the music and its proper rendering are the first things to be attended to; but, on the other hand, his most bitter opponents are prepared to admit that the other elements of public representation are of great importance. One of these is the proper understanding of the words by the audience. Of course, when a theatrical performance is given in a language other than that of the country in which it takes place, it is hopeless to expect that the audience as a whole will understand what is spoken on the stage. Thus, when a work like *Lohengrin* is performed for the first time in England in the English language, we, at all events, feel that the composer's intention that the words shall be understood by the whole audience is for the first time fulfilled. That the *libretto* should be—as Herr Wagner, we believe, asserts it ought to be—of as high an order of literary as the score is of musical merit is a condition which is certainly not approached by the English version by Mr. John P. Jackson used by the Carl Rosa Company. Here, for example, is an instance—and not the most striking which could be adduced—of the shortcomings of the English version. Elsa has just replied to the King's questions by a reference to her lost brother:—

THE MEN (*whisperingly*): Most wonderful! How singular her bearing!
THE KING (*affected*): Speak, Elsa, if thou would'st aught to me confide.
ELSA (*gazing before her as in a trance*):

Lonely my lot deploring,
I knelt to God and pray'd,
My grief to him outpouring,
I pleaded for his aid.

And from my woes unbounded
Escaped so sad a cry,
Like mighty notes it sounded
Far o'er me in the sky.

* * * *

In silver armour gleaming
A knight appeared to me;
So pure and noble seeming
The like I ne'er did see.

A golden horn hung lightly—
He leant upon his sword;
He seemed so high and knightly—
He shall me aid afford.

With courteous gentle bearing,
Gave comfort he to me;
No more my lot despairing,
He shall my champion be.

It is needless to make any comment upon these lines; but it is also fair to remember that the difficulty of translating poetry from one tongue to another is more than doubled when the translator has to arrange matters so that the musical accent is not disturbed or altered by the process of substitution. It is also fair to remember that the extraordinary beauty and dramatic force of the music in this passage make it of little importance to those who know something of the opera—and probably most of the audience do know something about it—whether the actual words are or are not somewhat disjointed and feeble. The music is so instinct with life and feeling that all one really wants from the words is a sort of indication of the tenour of the situation. No doubt it would be better if the words were equal in grandeur to their setting; but even then their merit might be drowned in the flood of music which begins here and rises to a majestic storm of passion at the appearance of the wondrous knight.

Apart, however, from any *dicta* of Wagner or his disciples, *Lohengrin* is a work which certainly gains by being given in a familiar language. No doubt the music and the action tell us that Elsa is accused by Telramund; that Lohengrin becomes her champion in return for her love, and that he warns her against doing something; that she disobeys this warning, and that he is obliged to leave her. But what Telramund's accusation may be, or what Lohengrin's warning, or why and when it is disregarded, or what necessity obliges the knight to abandon his dearly-loved bride, can only be explained by the actual spoken words of the libretto. Theoretically, in works cast in the "music-drama" form we ought to know at every moment what particular element of the general sentiment of the situation is being presented to us. For instance, if we only knew that the music between Elsa and Lohengrin immediately following the knight's entrance expresses their mutual love and the warning given to the Princess by her champion, without having the actual meaning of the words impressed on our minds, we should lose one of the most beautiful and poetic touches in the music, which lies in the fact that the *leit motiv* expressing Elsa's misfortunes is given to the voice once only, at the very moment when Lohengrin warns Elsa never to inquire who he is. And, as has been said, it is only fair to remember these circumstances in considering the manner in which Mr. Jackson has performed his task.

As to the soundness of the theory of lyrical drama illustrated by *Lohengrin*, we remarked on its first production in England that Herr Wagner is obviously right in thinking that the conventional forms of ordinary Italian opera are highly artificial. But so is every form which is employed to convey emotion from actors or singers to their audiences. People do not in real life burst into melodious song at exciting moments; but neither do they into lengthy recitative. It is impossible that a play, and still more an opera, should be anything but a highly artificial representation; and there seems no reason why, on the ground of truth to nature, we should prefer an opera written without to one written with full closes. On the other hand, we may certainly repeat what was before said, that Herr Wagner's theory is entirely to be admired so far as it contends that the dramatic plan and construction of an opera, or a music-drama, should be held to be of the first importance.

Most opera-goers are now fully acquainted with the beautiful story of *Lohengrin*, as arranged, with admirable effect and picturesqueness, from the old legend by Herr Wagner; and our present task may be confined to giving some account of the performance of this important opera by Mr. Carl Rosa's company. It may be said at once that, viewed generally, the representation is the best that has been seen in England; not so much because of any special excellence in the principals, although Herr Schott is in some respects the best Lohengrin that we have had on the English stage, as because of the better understanding of how the work should be treated, and of the feeling and unity of band and chorus. The chorus was in the first Italian representation at Covent Garden singularly weak, both dramatically and musically, and it was only natural that it should be so. The singers had to deal with music of an entirely unfamiliar kind, and they ought to have departed entirely from the conventional gestures expressive of emotion in Italian opera in order to realize and give expression to a variety of changing passions. In the great scene of Lohengrin's arrival they could not but give some effect to the swelling beauty and the fire of the music; but they failed to approach in any way the dramatic effect of the excitement spreading gradually from the outskirts to the heart of a vast expectant crowd, of the change from doubt and gloom to an awed but triumphant joy, which helped to make the scene thrilling on the stage of the old Dresden Opera-house. It is exceedingly creditable to Mr. Carl Rosa's stage-manager and the company who work under him that, with more limited resources, they manage to produce the same effect of an agitation rising from sceptical curiosity to full belief in the portent, and spreading wavelike through a crowd. There is, perhaps, in the whole list of the lyrical drama no scene more completely thrilling than this; it is impossible to resist the combined spell of the action and of the

marvellous music. To say that Mr. Carl Rosa's company give this scene so that one has no desire to find fault with it is to give them high praise. Another point in the dramatic action in the scene following this deserving special notice. The fight which it will be remembered ensues between Telramund and the Knight of the Swan is not easy to manage, and never has been well managed before now in England. In Mr. Carl Rosa's arrangement Telramund falls stricken to the ground before the mystic power of Lohengrin's upraised sword, both at this point and in the murderous attack made on the knight in the bridal chamber. The effect is infinitely more striking than that of the best arranged of elaborate mimic combats could be. Mr. Carl Rosa has done much that there is reason to be grateful for in this act, but he has strangely missed a fine effect in the following one, when the stage ought gradually to fill with a crowd of all kinds of people, from nobles to peasants, going and coming, as the day breaks into fulness. Before this the gates of the castle should have been opened by a warder carrying a lantern. The warder does not appear at all; the nobles stroll on the stage much as the nobles in all Italian operas are in the habit of doing, and the effect of the trumpeters answering each other from opposite towers is also omitted. We write of course in ignorance of the difficulties which the stage-manager may have to contend with, but we cannot but deplore these changes. The omission of the bringing on of Telramund's dead body in the last scene we can far more easily put up with.

It will be judged from what we have said that the general dramatic effect of *Lohengrin* was strikingly good. The orchestral performance was of an equally high order. Here and there it might be possible to quarrel with Signor Randegger's time; but we prefer to call attention to the unusual merit generally of the performance. There was a singular delicacy in the whole interpretation, and of this a striking instance was found in the exquisitely beautiful prelude to the first act. Herr Schott's Lohengrin is a fine piece of acting and singing. He is dignified and impressive, and he sings with true feeling. His cantabile passages are not altogether satisfactory, and he is apt, perhaps, to exercise too often his power of declaiming, instead of singing, when he has a word or two to utter in a moment of intense excitement. But on the whole his performance is one of exceptional merit. Miss Julia Gaylord seemed somewhat overweighted with Elsa, but it is very likely that this appearance was the result of nervousness and hoarseness. Miss Gaylord certainly knew what ought to be done with every phase of the part, and it was not often that she failed to give expression to her intentions. Miss Yorke sang well as Ortrud. Her acting gives one the impression that it is cramped by too much faith in adherence to strictly conventional methods. With Mr. Ludwig's Telramund hardly a fault can be found. Mr. Conly and Mr. Crotty sang well as Henry the Fowler and the Herald. Altogether the performance of the opera is highly satisfactory.

NINON AT THE ADELPHI.

It has been thought that the days of melodrama were well nigh over; that audiences accustomed to careful reproductions of everyday life, in which great care was taken to avoid anything like extravagance and to attain a certain sort of truthfulness, would be inclined to laugh at plays of the old-fashioned kind, planned with a view to strong dramatic effects and with heroic contempt for all manner of probability. Even actors, it was supposed, had lost the robust faith necessary for the performance of melodrama. Pieces of this kind cannot be fitly played unless those who render them have a thorough belief in them, and can fight, rescue, declaim, and defy with all the traditional vigour of the old stage, and without being unpleasantly haunted by a sense of absurdity. To not a few people it seemed that the romantic plays, with their broad effects and numerous incidents, and, it must be added, with all their balderdash, had gone the same way as the tragedies of the last century; and no doubt to a considerable proportion of those who go to theatres they would seem as ridiculous as the tragedies would if revived. To some actors, too, a requisition to appear in melodrama would appear about as reasonable as a requisition to appear with trained horses in an "equine" piece; and probably, if they were obliged to perform, they would be utterly unable to conceal their profound contempt for the play they had to represent. Still, in spite of scepticism and disdain both before and behind the curtain, and of the constantly growing inclination towards minute realism on the stage, it seems that melodrama is not by any means dead, and that it may yet please and excite audiences as of old. Mr. Wills has lately produced at the Adelphi a play of this kind, contrived in the old-fashioned way with a view to striking incidents, and with a high-minded disregard not only for probability, but for such petty matters as the records of poor plodding history. The actors who appear in it have no misgivings as to their work, and play with great vigour, and, with one notable exception, in the broad conventional style. The result has been decidedly successful. Audiences have approved, and indeed have grown greatly excited over some scenes in the piece.

One great merit, too often wanting not only in melodrama, but in dramas of all kinds, the play of *Ninon* certainly has. The principal idea on which it is based is a fine one, and undoubtedly admits of dramatic treatment. Whether Mr. Wills has done justice to his own conception, and whether he has been able to set fully before the audience the very striking character which suggested itself to him, is another question, which must, we fear, be answered in the negative. The author seems to have lacked either the will or the power to draw as it should be drawn the picture of his own heroine, and the piece, though telling, as any piece must be of which the principal *motif* is strong, is poor compared with what it might be. In spite of the interest of some of the scenes, the spectator feels a certain disappointment after witnessing the piece. It is, in one respect, so good that it ought to be a great deal better. The idea of the writer has been to represent a woman who, in furtherance of what she believes to be just revenge for a horrible wrong, stoops to the most cunning artifice in order to bring about the death of the man who, as she thinks, ought to pay for his wickedness with his life. While following out her scheme, she finds that this man, towards whom at first she feels so implacable, is of a noble nature, and by degrees her intense hatred changes to love, with which she struggles desperately. Finally she discovers that he is quite innocent of the crime imputed to him. What a fine conception this is, and how much might be made of it by a great dramatist, need scarcely be said. How Mr. Wills has dealt with the child of his own imagination will be best shown by a sketch of his play.

The scene is laid in Paris, and in the first act an old watchmaker called Baget is found bitterly lamenting the loss of his daughter Adèle, who has committed suicide, having, as he imagines, been seduced by the Count de St. Cyr. The confidant of his woes is Marat, whose life the author has considerately prolonged for some months, to enable him to listen to the watchmaker's story. Untroubled, therefore, by the knife of Charlotte Corday, whose visit Mr. Wills has taken the liberty of postponing, Marat is free to sympathize and to hatch diabolical plots, his invention being spurred by the fact that he had himself been a lover of Adèle. A very ingenious scheme suggests itself to him. Baget's other daughter, Ninon, who burns to revenge her sister, is, according to this plan, to appear in the streets so well dressed as to ensure her being hunted by the Republican Furies, and is to take refuge in the house of St. Cyr, who may be relied on to protect a pretty woman in danger. This young aristocrat has declared himself a Republican, and is a deputy; but Marat feels convinced that he is plotting with the Royalists. Ninon is to remain in his house, to gain his confidence, to make him in love with her if possible, and to find out his secrets. These discovered, he will of course go to the guillotine. Into this amiable little scheme Ninon, after a short hesitation, thoroughly enters, and she forthwith proceeds to carry it out. She dresses herself in silks which Marat provides, issues forth, is duly chased by Republican women, is rescued by St. Cyr, who of course appears at the right moment, and is taken to his house. She refuses to give her name, but leads him to believe that she belongs to his order and is in much danger. His sister Josephine suspects the newcomer from the first; but St. Cyr thoroughly trusts the beautiful stranger and keeps her as his guest. Ninon is thus able to follow all Marat's suggestions. She discovers, seemingly, that St. Cyr is a Royalist, and, as she stops some time in his house, she is able to make him madly in love with her. He is engaged in a plot for rescuing the Dauphin from the Temple; and, when he attempts to carry this out, she follows him, a spy on his movements. The rescue of the young prince is effected with an agreeable simplicity which is not uncommon on the stage. St. Cyr, disguised, enters the Temple without any difficulty apparently; and, after trying to get rid of the cobbler Simon by a series of devices too dull to take in even a cobbler, loses patience, thrusts him into a cell, bolts the door, and triumphantly walks off with the boy. His object is thus attained; but he is determined, apparently, to show that he has no more guile in him than the Republicans whose prey can be so easily taken from them; so, by way of keeping the prince perfectly safe and giving him some agreeable associations, he goes with him to the Place de Grève, where a Republican *fête* is to be celebrated, under the shadow of the guillotine. The youth and his wise protector are of course stopped; Marat, with an armed mob, appears, and Ninon, who seems to be a very indifferent spy, makes some communication to him. Nothing comes of it; for the Republicans, if suspicious for awhile, soon relapse into their habitual trustfulness, and St. Cyr is able to escape with the Dauphin. The scene ends with some declamation by Baget, who falls on his knees crying for vengeance after a fashion by no means uncommon with injured fathers in melodrama.

Up to this point the play, though marked by one fine scene between St. Cyr and Ninon, scarcely rises above ordinary pieces of the same class, and is in parts not a little absurd. In the next act, however, some real dramatic fire is shown, and there is a powerfully contrived situation which greatly excites the audience. St. Cyr has concealed the Dauphin in his house, and, having apparently some doubts as to Ninon's real feelings, in spite of her statement that she belongs to the aristocracy, he tries her by telling her that, having had the boy in his hands, he has done his duty as a good Republican and killed him. A woman's indignation at a hideous deed blazes forth, and she denounces him as a detestable assassin. Assured thus of her sympathy, he brings the boy into the room, and all seems well; but, as she is embracing the child, a signal is heard which tells her that Marat, in accordance with an arrangement made with her, is coming to search the house. Anxious above all things to save the unhappy little prince, she throws him

on a sofa, covers him with her cloak, and seats herself in front of him. An admirably contrived scene follows. Marat and his horde enter, the house is searched, and it seems again and again as if the prince must be found. Of course he is not, for the very good reason that, if he was, the play would come to an end; but it should be said that so well is his concealment managed by Miss Wallis, who represents Ninon, that the failure to discover him seems perfectly natural, and quite different from the usual stage failure to discover a victim. A dramatic effect of much intensity is obtained in a manner for which author and actress alike deserve high praise. Simon the cobbler, who is about to be executed for letting the prince escape, is introduced in this scene, at the end of which Ninon tells Marat to come to the house again at three o'clock with his followers. Whether she is merely seeking to gain time, or still intends to betray St. Cyr if she can, does not very clearly appear.

In the last act that nobleman's vindication, which has long been foreseen by an intelligent audience, is at length forthcoming. He was, it appears, in no way guilty towards the unhappy Adèle, who was decoyed away by a seducer who used his name. Just before committing suicide she wrote him a letter which makes it abundantly clear that he had not in any way wronged her. This letter is shown, as need hardly be said, to Ninon, who has once before been on the point of an explanation with him, but of course has had to defer it to the last act. She has long been torn by conflicting feelings, her growing love for him struggling with her desire for revenge. Now that she discovers her terrible mistake, she tells him of her vile artifice, and implores with frantic energy forgiveness, which for awhile he is unable to grant. He pardons her at last, however, and they rush off to be married in some rapid fashion, which is rather obscurely described. Marat, Baget, and the Republican crowd break into the house, and when the couple reappear, having got the knot tied with marvellous speed, St. Cyr is demanded as a victim. Ninon proclaims his innocence, and the two stand together before the mob as the curtain falls. Whether they are to be led off for trial and execution or are to be welcomed as good Republicans it is not easy to say; but very likely Mr. Wills intended that those who witnessed his piece should give it a happy or a sad conclusion as they thought fit, and if this has been his intention, he has certainly done well in leaving something to the imagination of the spectators.

That, in spite of not a few absurdities and of a good deal of very commonplace writing, his play has considerable merit, and that the third act is almost thrilling, cannot be denied; and it is equally clear from the success which *Ninon* has achieved that, notwithstanding the prevalence of what has been called "coat and waistcoat realism," audiences are still willing to welcome a strong mélodrama. But might not Mr. Wills, with such an idea as that which had occurred to him, have written something better than a strong melodrama? Might he not have relied less on the artifices—somewhat coarse even when at their best—which belong to pieces of this kind, and more on the genuine dramatic interest which attaches to such a character as Ninon? How much better it would have been to have shown more fully the beautiful picture of a woman changing hatred for love, and carried away, in spite of herself, by admiration for a character which she had begun by loathing, and to have dealt less in stage rescues, stage risks, and the like well-worn devices. A really powerful play might have been written on so fine a subject; but to attempt such a work Mr. Wills has apparently been unwilling. Perhaps, however, he is not to be blamed. He has preferred to embody his conception in a melodrama; and, though it is to be regretted that he should not have tried to produce something of a better kind, he may have exercised a wise discretion. He certainly deserves credit for having produced a melodrama which is far above the average. Probably a good many people who like plays of the old-fashioned class will be grateful to him for proving that the taste for them is not extinct; and perhaps some who cannot get over the absurdities of melodrama will be grateful to him for a very different reason—namely, for having given an actress who appears likely to take the highest rank an opportunity of showing that tragic power which, always rare, is especially rare now. It is seldom that anything is seen on the English stage so fervid and so full of real feeling as the acting of Miss Wallis in the last scene of the play, where Ninon implores her lover's forgiveness. It may not impossibly remind some spectators of Mme. Sarah Bernhardt's rendering of the final scene in *Ernani*, and indeed is in one respect superior to it; for Miss Wallis does not overstep the modesty of nature, and makes no attempt to heighten the pathos of the situation by pawing her lover's head, as the French actress did. In other parts of the play Miss Wallis renders invaluable service to the piece, as she makes a great deal of what are really rather baldly written scenes. With regard to the other performers who appear there is little to be said. All play with zeal and energy, and without extravagance; and all seem to have, as has been said, that belief in their characters which is essential to melodrama; but there is nothing in their acting to call for any special notice.

REVIEWS.

RUSSIA BEFORE AND AFTER THE WAR.*

MR. TAYLOR'S translation is so easy and idiomatic that it might pass for an original work. The knowledge both of English and of German which it displays is the best guarantee of the accuracy of the version. The value of the book itself is in some degree impaired by the fact that it is anonymous, for many of the statements depend on the authority of the writer, whose competence and veracity can now only be estimated with the aid of internal evidence. It is evident that he is not a violent partisan, and that his sympathies are with the moderate or constitutional reformers in Russia. His severe censures on the Government are combined with contemptuous disapproval of the Nihilists and of the agitators for Slavonic supremacy. It appears from the only autobiographical passage in the book that the author is a German subject of Russia belonging to the Baltic Provinces. For the purpose of illustrating his account of the policy and practice of the Government in matters of education, he explains his own reasons for becoming five-and-twenty years ago a student of the University of St. Petersburg. He would have preferred the Livonian University of Dorpat, where the institutions and the form of instruction are exclusively German; but he could not be admitted to Dorpat because he could not then pass an examination in the Russian language, and he was therefore compelled to prefer St. Petersburg, where the lectures and other academic proceedings are naturally conducted in Russian. Entering the University in the crisis of the Crimean war, immediately before the death of Nicholas, he never heard the smallest interest expressed in the siege of Sebastopol or in the result of the war. It would seem that Nicholas had succeeded in stamping out patriotism as well as every independent thought and emotion. The Emperor had a few years ago been with difficulty dissuaded from a scheme of suppressing all the Universities in Russia. He was ultimately content with a narrow restriction of the number of students, and with the enforcement, through general officers who were placed at the head of the Universities, of rigid military discipline. Although the regulations have been greatly relaxed during the present reign, it seems that the discontent and turbulence of the students date from the time of Nicholas. Down to the present time the University rules have been subject to frequent and capricious changes, and the habit of grumbling has a tendency to become chronic. A few days ago the newspapers published a complaint or remonstrance from the pupils of the Real schools, who absurdly call themselves Realists, though their title merely implies their occupation with experimental or applied science. Their main grievance seemed to be the alleged encouragement afforded to classical or literary studies. It is surprising that the Russian Government should be accused of undue preference for the kind of culture which is most likely to produce intellectual activity and independence. When the author of the present volume matriculated at St. Petersburg, he found that an acquaintance with the first ten lines of the Odyssey was accepted by the examiners as ample proof of his proficiency in Greek. His account of the system and history of the Russian Universities is elaborate and instructive. One result of the mode of education is the production of a large class of social and political malcontents. The revolutionary tendencies of University students are indeed not peculiar to Russia, but they seem to be more general and more troublesome there than in any other country.

The title of the book almost suggests the suspicion that it has been selected for the purpose of attracting English readers. The Turkish war to which it refers is merely an incident in the history of Russian policy, which is for the most part confined to internal affairs. It is true that the writer attributes great importance to the probable consequences of the war. The general indignation at the corruption and incapacity which were disclosed by the campaign has greatly increased the prevailing dissatisfaction with the system of absolute government; but still more serious results may possibly follow from an impression of an opposite character. The Government, the majority of generals, the administrators, and the contractors have covered themselves with odium; but the officers and soldiers appear to have inspired confidence and gratitude, which in the opinion of the author are not undeserved. "Politically the circumstance of most importance is this, that the popular verdict on the recent war amounts to a glorification of the warlike resources of the nation, and a condemnation of the way in which they were abused." There is too much reason to fear that any party which may obtain power will appeal to national vanity by promoting new aggressions. The Government also will perhaps bid against its opponents, while it will hope to divert popular disaffection into external channels. The extreme vexation which was caused by the diplomatic defeat of Russia after the war is still a cause of irritation. "The publication of the [Berlin] Treaty raised a storm of moral indignation throughout Russia, and was received like a heavy and altogether unexpected disappointment. The people woke up from their dreams of cloudland." The people could only account for the abolition of the Treaty of San Stefano "as if there was one explanation, and one only, for all that had occurred, namely, a malevolent distrust of his people by the Czar." If the

cogency and force which are irresistible. Deities which had long since passed out of the memory of the people are shown again in their ancient forms; and the restoration is effected, not by any arbitrary guesswork, but by adducing the testimony of indifferent, or even hostile, writers, of expressions from old charters, of phrases still current in the talk of the people who no longer attach to them any definite meaning, of expressions in popular songs, and of traditions which are preserved to us only in the pages of mediæval chroniclers. His purpose is stated distinctly at the outset. He wishes to ascertain precisely what the old German heathenism was, so far as it stands opposed to the Norse or aloof from it, and he lays down the conditions by which the degrees of likeness or difference are to be determined. If his conclusions are not to be accepted, the battle must be fought out at the threshold; and it will be a hard matter to dispute the grounds on which, as he asserts, rest "the antiquity, originality, and affinity of the German and Norse mythologies." The first of these is the affinity of the dialects spoken by all Teutonic and Scandinavian tribes; the second is their joint possession of terms relating to religious worship. "If," he says, "we are able to produce a word used by the Goths in the fourth century, by the Alemanni in the eighth, in exactly the same form and sense as it continues to bear in the Norse authorities of the twelfth or thirteenth century, the affinity of the German faith with the Norse, and the antiquity of the latter, are thereby vindicated." The third test is found in "the identity of mythic notions and nomenclature, which ever and anon breaks out; thus the agreement of the O. H. G. muspilli, O. Sax. mudspelli, with the Eddic muspell, of the O. H. G. itis, A. Sax. ides, with the Eddic dis, or of the A. Sax. brosinga-mene with the Eddic brisinga-men, affords perfectly conclusive evidence." It is unnecessary to cite the other propositions, and scarcely necessary to remark that the three which we have cited cover a much larger space than Grimm undertook to traverse. We may put the Greek on the one side and the Hindu on the other; and the conclusion remains just as incontrovertible. The identity of the Greek Erinys with the Vedic Saranyu, of the Greek Ouranos with the Hindu Varuna is as clearly proved as that of any Teutonic with any Norse term; and, indeed, although this forms no necessary part of his task, Grimm found himself obliged to take count of the relations of Teutonic and Norse with Hellenic mythology. His survey of the whole field of popular tradition and belief shows him that "all nations have clothed their gods in human shape, and only by way of exception in those of animals; on this fact are founded both their appearances to men, or incarnation, their twofold sex, their intermarrying with mankind, and also the deification of certain men." It further reveals to him the greater prominence of certain characteristics in one system as contrasted with another, and also the evidence that where these characteristics have faded away into the background this had not been their condition from the first. Thus the gods of the whole Aryan world eat, drink, and sleep; but beings who eat, drink, and sleep must die. The Northern mythologies kept this notion before the people with startling clearness; the Southern disguised it and practically put it out of sight; but it was there nevertheless. The Olympian gods feast on ambrosia and are refreshed by nectar, the Soma of the Hindu; but they can be wounded and suffer pain, they may hunger and thirst; and to the Norse mind the inference was oppressively plain. The beautiful Balder has his yearly death and resurrection; but the time will come when the great enemy of all the gods will be let loose, and Asgard shall be desolate. This enemy is Loki, the fire god, who, in punishment of his misdeeds, is put in chains, like Prometheus, and whose release just before the coming on of the twilight of the gods is in close agreement with the release of the chained Prometheus, by whom the empire of Zeus is to be brought to an end. Grimm adds that "the formula 'unz Loki verdr lauss' answers exactly to the Greek πρὶν ἂν ἐκ δεσμῶν χαλάσθῃ Προμηθεύς; the writhings of the fettered Loki make the earth to quake, just as χθὼν σεσάλευται in the case of Prometheus. Only the Greek Satan excites our noblest sympathy, while the Edda presents Loki as a hateful monster." For the reason we need, perhaps, go no further than the use to which the fire is put in the Greek myth. The Northern Odin or Woden is the All-father, from whom men may expect substantial justice; in the Promethean tradition Zeus is an arbitrary tyrant, with a special hatred for mankind. The latter are in a state of abject misery until they receive the boon of fire; the giver of it thus becomes their friend, and his deliverance is associated with the triumph of righteousness over wrong. But it would perhaps be difficult to determine how far the purely spiritual colouring thrown over the myth is not due to the mighty genius of Æschylus; nor is it a hard task to imagine a Prometheus in whom we should see simply a counterpart of the malignant and mischievous Northern god. Nay, even in the case of Loki himself, Grimm notes that among the common people there linger to this day many conceptions "in which Loki is by turns taken for a beneficent and for a hurtful being, for sun, fire, giant, or devil."

In the East, then, as in the West, the same process was going on, a process in which the characteristics of the gods were derived from impressions made on the senses by the phenomena of the outward world, and were gradually moulded into human semblance. Thus far the deities were only magnified men; but Grimm presses the argument too far when he says that they were regarded as subject to the encroachments of age, the evidence being that "Odinn or Wuotan is pictured everywhere as an old greybeard, Thórr as in the full strength of manhood, Balder as a blooming youth." His statement is rather incomplete than wrong when he adds that "the sons of men grow up slowly and gradually, gods attain their full size and strength directly after birth," the Greek Apollo and the Norse Vali, son of Odin, being cited as illustrations, together with Hermes, who, "born at early morn, plays the lute at midday and at eve drives oxen away." So far as the age of the gods is concerned, we might say that it never alters. Odin is always old, Thor is always in mature manhood, Balder and Apollo always in radiant youth. Hermes, on the other hand, is never old; but he may at will return to the state of infancy. In other words, the sunlight is always brilliant; the wind may die away into gentle whisperings or absolute silence after the most tremendous tempest. But it is undeniably true that the notion of physical vastness is common to the pictures of some of the gods, whether in the Greek or in the Northern systems of mythology. The body of the fallen Ares covers seven roods of land; the mighty Thor devours an ox and eight salmon at a single meal. Both the Greek, the Teutonic, and the Norse gods love merriment, and may burst out into inextinguishable laughter; and although they can move with astounding swiftness, they are nevertheless local, and all have their offices and functions. There is no feature in the mythology of the Iliad and Odyssey which may not be traced throughout the wide extent of Aryan tradition. But in each portion of it the mythology is coloured by the conditions of the popular or national life, the beliefs being accordingly sombre or bright, graceful, cumbrous, or grotesque. To Grimm the manifestations of deity in Asiatic legends seemed to be more deeply and purely conceived in comparison with those of the Western Aryans. In these

the god comes down and abides in the flesh for a season for the salvation of mankind. Wherever the doctrine of metempsychosis prevailed, the bodies of animals even were eligible for the avatâra; and of Vishnu's ten successive incarnations the earlier ones are animal; it was in the later ones that he truly became man. The Greek and Teutonic mythologies steer clear of such notions; in both of these the story of the gods was too sensuously conceived to have invested their transformations with the seriousness and duration of an avatâra, although a belief in such incarnation is in itself so nearly akin to that of the heroes being bodily descended from the gods.

All this runs curiously counter to the notion that in the mythology of the Iliad and the Odyssey there are any characteristics which separate it absolutely from that of the Aryan epic poems or of the legends of the Aryan tribes generally. The Iliad and the Odyssey reveal no changes in the popular belief which may not be discerned at work elsewhere; nor is there apparently any reason for looking on the mythology of these two poems as prior in the order of time any more than in the order of thought to that of the Greek lyric poets or of the other poems which went by the name of Homer. Mr. Gladstone's special theories on the subject of Homeric mythology are thus left on one side; and if Grimm's conclusions may be regarded as established, the door is shut on a controversy which may be as unprofitable as it is likely to be protracted. For the present it is more to the purpose to mark the emphasis with which Grimm, writing nearly half a century ago, insisted on the closeness of the affinity between the Teutonic and the Greek mythology—an affinity for which, as in the relation of the Greek and the Teutonic languages, there is, he insists, "no question of borrowing or choice, nothing but unconscious affinity, allowing room (and that inevitably) for considerable divergences."

Of the learning and the sound judgment with which every part of his great subject is illustrated, only those who have spent some time over the book can form an adequate idea. In a few cases perhaps he has left unnoticed points which might seem to strengthen his position. Thus, in speaking of the practice of baking dough in the shapes of animals, he remarks that "baking in the shape of a boar must have been much more widely spread than in the North alone," and refers to the baking of "cochelins" for New Year's Day in France. He might also have referred to the Egyptian custom of baking swine-shaped pieces of dough mentioned by Herodotus. The comparison, if it holds good, would seem to suggest that the European practice was in like manner the substitution of a less for a more costly victim. One of the best sections in this volume is that which treats of Wish, the correlative of the Vedic Kama, and endowed to even a greater degree than Kama, with all the attributes of personality; but we fail to see why to Grimm's thoroughly convincing demonstration the translator should think it necessary to append a note, in which he says:—"That Wish was personified, and very boldly, by the Christian poets, is abundantly proved. That he was ever believed in as a person, even in heathen times, is to my thinking far from clear. I believe some German scholars regard the notion as little better than a mare's nest." The remark seems to have no force, unless the phrase "believed in" is to be taken as equivalent to "worshipped." There is perhaps no reason for saying that Kama was ever an object of worship; but this remark applies also to the Greek Charites, and many other beings whose personality nevertheless we cannot call into question. Not less instructive is the chapter in which Grimm deals with the question whether before their conversion to Christianity the German tribes had any constructed temples. That they used consecrated groves as temples is beyond dispute; but it would appear that built temples were not wholly wanting, although the preference of the people was for the former. This preference Grimm accounts for in one of the few animated passages which break the judicial dispassionateness of his general argument:—

At a time when rude beginnings were all that there was of the builder's art, the human mind must have been roused to a higher devotion by the sight of lofty trees under an open sky, than it could feel inside the stunted

structures reared by unskilful hands. When long afterwards the architecture peculiar to the Teutons reached its perfection, did it not in its boldest erections still aim at reproducing the soaring trees of the forest? Would not the abortion of miserably carved or chiselled images lag far behind the form of the god which the youthful imagination of antiquity pictured to itself, throned on the bowery summit of a sacred tree? In the sweep and under the shades of primeval forests the soul of man found itself filled with the nearness of sovran deities. The mighty influence that a forest life had from the first on the whole being of our nation is attested by the 'marchfellowships'; *marka*, the word from which they took their name, denoted first a forest, and afterwards a boundary.

FOURTEEN MONTHS IN CANTON.*

IT is difficult to understand why this book was published. It consists of a series of letters written by Mrs. Gray to her mother, in which she describes the events of her life during her stay at Canton. These letters, Mrs. Gray tells us in her preface, "were written for circulation amongst my family and a few friends who kindly expressed an interest in all I saw and did in the far-off country of China." For this purpose they are, no doubt, admirably adapted. They contain a great deal of information which was probably new and strange to her correspondents, and the personal narrative which runs through them might readily have invested them with interest to those for whom they were primarily written. But there is a wide gulf separating communications of private and of public interest. Letters which, in a small circle of friends, easily gain a reputation for originality of matter and winsomeness of manner, are no sooner published than they are brought into open competition with all works bearing on the same subject; and, unless they can supply omissions in our previous knowledge or throw a new light on their theme, their author must expect to hear the question asked, Why are they here?

In Archdeacon Gray, the "Henry" of the letters, Mrs. Gray had the best possible guide in her expeditions in and about Canton. Every nook and corner of the city and neighbouring country yielded up their secrets to the indefatigable Archdeacon during his residence of a quarter of a century in the British settlement; and on his return to his post, after a period of rest in England, he must naturally have felt a pleasure in introducing to his bride's notice the scenes with which he was so thoroughly familiar. But Archdeacon Gray is not only well acquainted with his subject, but he has also written about it. His *Walks in the City of Canton* (1875) bristles as plenteously with information as it does with commas, and, as far as the first characteristic is concerned, leaves nothing for Mrs. Gray to tell us. This she practically admits in her letters, since almost everything she describes which is not of personal interest is but a reflection of what we find in the Archdeacon's book, and sometimes, like the reflected images cast in the waters of Canadian lakes, these reflections are so like the realities that they have all the appearance of being one and the same thing. The description in both books of the Emperor's temple is an instance in point, and is as follows:

ARCHDEACON GRAY.	MRS. GRAY.
In front of the principal entrance, there stands a massive monumental arch of granite. The gates of the grand entrance are surmounted by a lofty roof of yellow tiles. On passing this gate, we entered a small courtyard. On the opposite side of this area, there is a gateway resembling, in all respects, that to which we have just referred. When we had passed through this second gateway, we found ourselves in the great quadrangle, or courtyard of the temple. This quadrangle is enclosed on each side, by cloisters, the roofs of which are, by wooden pillars, supported. On the side of the quadrangle, which is immediately opposite to the entrance gates, stands the great shrine in which, the tablet, representing the Emperor, is placed. In the centre of the panel pathway, which conducts through the quadrangle to this shrine, and on the steps, too, by which that fane is more immediately approached there are sculptured in granite, two, or three figures of dragons and a representation of the sun. Upon these sacred emblems, no person, it is supposed, will be so sacrilegious as to tread. The consequence is that persons, when traversing the quadrangle, and ascending the steps by which the great shrine is approached, are obliged to make a detour. Thus, as it is intended, they walk not in a direct line towards the throne on which the tablet, representing majesty, stands. The shrine is enclosed by red stained walls, and is covered with a roof of yellow tiles.	We passed through a massive granite arch, and saw the lofty roof of the temple covered with yellow tiles, which denotes that it is a state endowment. We then went through two courtyards into a quadrangle enclosed by cloisters. Immediately opposite the large entrance gates stands the great shrine, containing the tablet of the Emperor. In the centre of the paved pathway, and also on the steps leading immediately to the shrine I saw two or three figures of dragons, and a representation of the sun engraved on the stone pavement. No person, it is supposed, will be sacrilegious enough to tread on these sacred emblems, and therefore no one will dare to walk straight towards the throne of majesty on which the imperial tablet rests. The shrine is enclosed by red stained walls, and the roof is covered with yellow tiles.

And so on. This is no solitary instance, but throughout the volume similar cases occur over and over again. Sometimes in the midst of what are virtually quotations we meet with some slight but curious divergences as to fact, which make us wonder whether the Archdeacon has been misled, or whether Mrs. Gray has misread the Archdeacon, or whether the printer has misunderstood Mrs. Gray's manuscript. After describing the charnel-house of a Buddhist monastery very much in the terms of her husband, Mrs. Gray says, "Another large ossuary . . . has received its full complement of human ashes, viz., the ashes of 4,948 monks, and more than this a Buddhist is not allowed to deposit in one ossuary." The Archdeacon, on the other hand, says, "For, into an ossuary, so say the Buddhists, the charred remains of not more than five thousand, and forty-eight monks, can be thrown." Again, in describing a duck-farm Mrs. Gray says, "There are itinerant duck and geese vendors, who come to the villages in large boats; they buy from 150 to 1,000 ducks or geese at a time." The Archdeacon in this passage also is not faithfully followed. He says, "Each of these itinerant vendors of ducks buys, at one time, fifteen hundred or two thousand ducks."

But, whether faithfully or unfaithfully, Mrs. Gray follows very closely upon the heels of the Archdeacon in his "Walks." There is, however, as we have said, a personal side in her narrative, and from this it is possible to gather some pictures of antique Oriental life which are well calculated to strike the imagination. There are few who, even at the cost of getting up at two o'clock in the morning, would not like to have been at the Emperor's temple on the annual occasion when at break of day all the mandarins in the district, from the Viceroy downwards, bow themselves thrice to the ground before the Imperial tablet which stands in the place of one who is the "Son of Heaven" and ruler of "all the Earth." There is something in these days of unrest and "push," very captivating in the solemn observances, quiet dignity, and leisurely ease of Chinamen. Their courtly interchange of civilities, their profound salutations, their quaint imagery of speech, their love for those dimly obscure monuments of learning which have been handed down to them from Confucius and still earlier sages, their supreme reverence for age, their conscientious observance of their filial duties, their measured steps, and imperturbable bearing, are all national characteristics, which are to be prized, and not to be lightly thrown away in exchange for something they know not what. China is now the only country in the world where an ancient form of Oriental civilization has been preserved uncontaminated by the upstart ideas of Western nations. As she was, so she is; neither richer nor poorer, neither advancing nor receding, unchanging and feeling no need of change. What, we are tempted to ask, would be the result of the introduction of "Western civilization" into such an Empire? Would the people be happier? Would they be more law-abiding? Would they be more dutiful to their parents, or more honest in their dealings, if, instead of travelling leisurely in boats or in mule-drawn carts, they were to be whisked through the country at the rate of thirty miles an hour; if, instead of being in ignorance of the treasures beneath their feet, they were to be initiated into the mysteries of the formation of joint-stock Companies for the working of mines which exist, or do not exist, as the case may be; or if, instead of the slow-and-sure system of commerce which now obtains among them, they were to be made to experience the excitement of gambling in bubble Companies, and the despair consequent on "black Fridays"? If we might be allowed to argue from the particular to the universal, and to judge of the probable result on the nation of contact with Europeans by the effect produced on the natives at the open ports by an acquaintance with us and our ways, the answer to these questions would not be encouraging. The Duke of Somerset once described Shanghai as a "sink of iniquity." No doubt the expression was exaggerated, but what Shanghai is, that we have made it.

Against the demoralizing effect of consorting with foreigners the Chinese literati have, at Canton and several of the other ports, established a counterblast in the shape of lectureships on the principles of Confucianism. These aids to morality are especially intended for the uneducated classes, who might naturally be supposed to be more easily led away than their learned countrymen, and who have not benefited by the advantages enjoyed by every schoolboy in the Empire of reading, learning, and digesting the words of Confucius and his followers. The doctrines of the sage, and history, so far as it throws light upon them, form the sum total of Chinese education. The Confucian classics are the text-books in every school, and it is on their contents that candidates for degrees are examined at the great competitive examinations. We have heard much glib talk of late years of the Chinese competitive system, and the ability which as a rule distinguishes Chinese Mandarins is pointed at in support of the introduction of competitive examinations among ourselves. But, as a matter of fact, Chinese candidates compete not for office, but for literary degrees, the possession of which, except of the highest rank, merely qualifies the holders for office, and in no way insures them appointments. The first degree, or that of Siu-tsai, is conferred at the Prefectural cities after examination of the candidates by the magistrates of the districts within the Prefectures. The next, or Kü-jin degree, is won at the provincial capital, and the Tsin-sze degree, the highest obtainable, is competed for at Peking at triennial examinations. Both Mrs. Gray and the Archdeacon give us a description of the Examination Hall at Canton, in which we are told stand eleven thousand six hundred and seventy-three cells for the accommodation of Siu-tsai competitors for the Kü-jin degree. But even this number is often not large enough for every candidate to have a cell, and mat sheds are then run up to house the surplus. For the nine days during which the examinations last these cells are the homes of the candidates, and must add considerably to the severity of the ordeal

* *Fourteen Months in Canton.* By Mrs. Gray. With Illustrations. London: Macmillan & Co. 1880.

by their limited accommodation and scanty furniture. A space of five feet six inches by three feet eight allows a man small latitude for comfort or exercise, and the deal boards which have a double debt to pay, as a bed by night and table all the day, do not promise much rest after the mental toils of elaborating Confucian maxims.

But Mrs. Gray and the Archdeacon penetrated elsewhere besides the public buildings of the city. They visited the cat and dog *cafés*, and saw joints of dogs and portions of cats stewing in tempting gravy. Curiously enough, the position of the dishes and stewpans, and the exact nature of their contents, were almost identically the same when the Archdeacon wrote in 1875 as when Mrs. Gray visited the restaurant in 1877. They dined with Chinese friends; they witnessed Chinese plays; they were startled by Chinese conjuring; and Mrs. Gray personally investigated the mystery of the women's bandaged feet. To many people all this will be interesting enough, but, as we have already indicated, *Fourteen Months in Canton* is a disappointing book. We are ready to believe that when the letters of which the work consists were originally written, Mrs. Gray drew upon the Archdeacon's *Walks in the City of Canton* with the knowledge of her correspondents, and that she published them thoughtlessly without considering what was due to the larger public she addressed. Some such apology for her love of making extracts is certainly needed.

ALTRINCHAM AND BOWDON.

MR. INGHAM'S History is a fair average example of a considerable and apparently increasing class of books—compilations the merits and defects of which are so evenly balanced that it is impossible to award to them either banning or blessing. They are good enough to pass muster and avert blame, but have so many imperfections that praise is out of the question. It is not a little remarkable that local histories and topographies, in which English literature is exceptionally rich, should be so commonly amenable to this charge of decent mediocrity. Whilst they frequently show great industry and laborious research, it must be confessed that they are rarely attractive. They give information, but not delight. A cursory examination of Mr. Ingham's book enables us to get at some of the reasons why works of its class do not attain to a higher place in literature. The initial cause of the failure is that the author does not begin at the beginning. He starts with the assumption that the reader is possessed of a knowledge of scenes and incidents with which he is himself familiar, and so, unwisely and unwittingly, he omits some of the "necessary business" of his theme. This is one of the commonest mistakes of unpractised authorship, and is at the root of half the failures in literature. The right method, especially in local histories and topographies, is for the writer to assume that his possible reader is a dweller at a distance, and wholly ignorant of the locality to be described and of the events which have occurred within its boundary. If Pennant and Daines Barrington had been Gilbert White's neighbours, it is almost certain that we should never have had the minute account of Selborne which is contained in the *Antiquities* and the first nine of the letters to Pennant. White laid down the right "idea of parochial history" in the brief and modest preface which he addresses mainly to "the stationary men" who write about "the districts in which they reside"; and, apart from its value as a contribution to science, the *Natural History and Antiquities of Selborne* remains, after the lapse of a hundred years, the classic model of all works of its class. Mr. Ingham's work is defective and weak precisely where Gilbert White's is strong. We do not here refer to the natural history observations, which are of course the distinctive object of the Hampshire curate's book, but to those introductory portions which deal with the position, the outward aspects, and the people of the parish. In Mr. Ingham's work all these essential details are absent. He does not tell us where Altrincham and Bowdon (they are now virtually one town) are situated, or what is their geographical position relatively to the county of Chester. The topographical features are only vaguely referred to; the geology of the district is barely mentioned; and the botanical and ornithological characteristics, which are of great interest, are not once named. Still more disappointing is the omission of any careful account of the mode of life of the people, of their industries, employments, and means of living. It will be gathered from this that Mr. Ingham's book is destitute of original observation; it is, in fact, mainly a compilation from other books and from registers, records, and similar documents. Even in this respect its value is much depreciated by the deliberate omission of all references to his authorities. In his preface he takes credit for the fact that he has printed "no footnotes or other aids to bewilderment and confusion." Footnotes, however, serve quite other purposes; they are required as a test of authenticity; and, moreover, seeing how much Mr. Ingham has been indebted to Leycester, Ormerod, and other Cheshire historians for a very large portion of his material, it is scarcely fair on his part to have made no acknowledgment of the sources of his information. We have intimated that the book has merits. It is an unpretentious compilation, setting forth in fair narrative form the course of events, and evidencing much painstaking industry and research. Although sadly wanting in perspective, in the loving detail of long acquaintance and close observation, and in literary attractiveness, it has qualities which are too often absent from more ambitious works of its class.

Altrincham and Bowdon both trace their history a long way back. Bowdon is mentioned in the *Domesday Book* as Bogedon, the dwelling by or on the Down; and Altrincham has a charter of incorporation six hundred years old, granted by Hamon de Massey, the first Baron of Dunham, in the reign of Edward I. Down to the end of the last century, however, the two places were small and comparatively insignificant villages; the points of interest in their annals were few, and the historic thread would be very thin indeed were it not intertwined with the career of the successive owners of Dunham. The families which have held, first the castle and barony of Dunham, and subsequently the hall, park, and lordship of the manor, form, in fact, the connecting link which gives something like cohesion to the fragmentary annals of Bowdon and Altrincham, and brings them into association with the history of the county. Hamo, or Hamon de Massey, the first Baron of Dunham, held the lordship under the Earl of Chester at the time of the Domesday Survey. His castle was one of the chain of forts erected, or more probably strengthened, to guard Cheshire against the marauding incursions of the barons on the northern side of the Mersey. At that time—1086—there was already a church at Bowdon, which was certainly of Saxon foundation. The direct descendants of Hamon de Massey held the barony for two hundred and sixty years, the sixth and last baron dying in 1342. Then, after an interval of nearly a hundred years, during which the barony was the subject of sundry "great suits" between contending claimants, the estates at Dunham Massey came into the possession of the Booth family, the founder of which was Robert del Bothe, a younger son of Sir John del Bothe, of Barton, near Manchester. The eighth member of the line was created a baronet in the reign of James I., and his son George was the first Lord Delamer. This George Booth was a man of strong convictions, extraordinary activity, indomitable courage, and, as Clarendon says, great natural impetuosity. As the leader of the Presbyterian party in Cheshire, he was prominent on the side of the Parliamentarians throughout the Civil War; but his independence of spirit was shown, first by his inclusion among these representatives in Parliament to whom Pride's Purge was applied, and afterwards, in Cromwell's later years, as the chief mover in Cheshire for the restoration of the exiled Stuart to the throne. Defeated by Lambert at the decisive battle of Winnington in 1659, he escaped in the disguise of a woman, was captured in Buckinghamshire, and sent to the Tower, but released on the dissolution of the Long Parliament. On the restoration of the King he was created Baron Delamer as a reward for his services. His son, the second Lord Delamer, was an equally active participator in public affairs, and for his defence of what he conceived to be the rights and liberties of the people against the proceedings of Charles II. and James II. he was thrice committed to the Tower, and afterwards tried by Judge Jeffries and a jury of his peers for alleged complicity in the rising of the Duke of Monmouth, but acquitted. By William, in whose behalf he took up arms in Cheshire, he was created Earl of Warrington. The heads of the family who have succeeded, either by direct or collateral descent, to the estates at Dunham, have resided there until within the last ten or fifteen years, and have maintained uninterruptedly a close connexion with the affairs of Altrincham. One of the sons of the house, the Honourable Booth Grey, served the office of mayor in 1758. The fine park, which skirts the northern boundary of Altrincham and Bowdon, has always been kept open for the free use of the inhabitants, and only a month or two ago the present Earl of Stamford and Warrington gave a plot of land for a public park on another side of the town. Mr. Ingham's biographical sketch of the Booths is well done, and particularly valuable is his reprint of the scarce account of the trial of the second Lord Delamer.

The history of Altrincham as a corporation is as quaint and amusing as the records of these ancient forms of municipal life usually are. Sir Charles Dilke's Committee on unreformed municipal corporations, if it ever extends its inquiries as far as this mid-Cheshire town, will not have much fault to find with its administrative proceedings. The eccentricities and worse of such places as Pevensey, Seaford, Brading, Corfe Castle, and Saltash are happily altogether absent from the corporate annals of Altrincham. The charter recognizes a mayor only; there are no aldermen or councillors. Strange to say, the duties of the mayor have not been superseded by the local Board which was established in 1851; neither has the mayor a place on that Board; nor, seemingly, any connexion with it. Under the new and altered conditions of local government he appears to be an anomaly; but no attempt has been made to abolish the office. What his precise powers and duties are it is difficult to discover. The privileges conferred by the charter in 1290 were at the time undoubtedly of great value and highly esteemed. They included an immunity from tolls; the abolition of many servile customs; the grant of rights to all burgesses to cut turf and heath for fuel and thatching purposes, to pasture cattle, and to feed swine on the lands of the lord of the manor; and to obtain timber for the repair of houses and outbuildings. The charter also secured a trial by his peers for any burgess; "nor," says Hamon de Massey's document, which is still preserved in the archives of the town, "shall they be interfered with out of their borough on account of trespasses done within the borough." In return for these privileges, all that appears to have been re-

* *A History of Altrincham and Bowdon; with an Account of the Barony and House of Dunham.* By Alfred Ingham. Altrincham: Mackie, Brettnall, & Co. 1879.

quired of the inhabitants (in addition, probably, to some personal services) was that they should grind their corn at the Baron's mill and use his bakehouse. In course of time various officers were appointed to carry out the behests of the mayor—constables, market-lookers, burleymen or bylawmen, leather-sealers, swine-lookers, ale-tasters, pump-lookers, dog-muzzlers, chimney-sweepers, and the bellman. Each of these had his duties in those simple times. The leather-sealers took care that persons did not sell insufficiently tanned leather. The pump-lookers saw that "no person washed potatoes at ye town's pump, or watered horses, or fetched water to make daub or mortar." The market-lookers prevented the sale of meat unfit for food, and the giving of short weight by bakers. It speaks well for the good beer brewed in those days to find that the ale-taster's office was a sinecure, as there is no mention in the corporate records of fines inflicted on the information of this functionary. A good deal of fun was made of the Mayor of Altrincham in earlier days, doubtless because the office was frequently filled by people in a humble way of life. An old rhyme says:—

> The Mayor of Altrincham and the Mayor of Over,
> The one is a thatcher, the other a dauber.

Sir Walter Scott, in the *Heart of Midlothian*, refers to a Cheshire saying, "I was like the Mayor of Altrincham, who lies in bed whilst his breeches are mending." And a story is told of a Mayor of Over who, on his way to Manchester, called for a shave at a shop in Altrincham. When the barber had finished, his worship said, "You may tell your customers you've had the honour of shaving the Mayor of Over." To which the other replied, "And you may tell yours that you have had the honour of being shaved by the Mayor of Altrincham." The day of mayoral barbers and bakers has long since vanished, and the wealthier residents do not disdain to accept the post; but it is probable that Sir Charles Dilke and his Committee will ere long prove too much for those antique and useless remnants of municipal authority, which, like the corporation of Altrincham, are now little better than a burlesque of local government.

Thomas de Quincey as a child, and again as a youth, visited Altrincham for a day, and he describes in his autobiographical sketches the scene in the market-place in the early morning—the "bonny young women, all trooping about in caps and aprons coquettishly disposed," the butchers' stalls brilliantly clean, the fruits and flowers "scattered about in profusion," and many other things, making altogether "the gayest scene I ever beheld." At that time Altrincham was little more than a village, but as the market town of a considerable agricultural district it was a place of some importance. Since then the railway has changed the entire aspect of the place. Altrincham and Bowdon have become suburbs of Manchester; the population has grown from two thousand or thereabouts to nearly fifteen thousand, and by the end of the century every trace of the primitive Altrincham which De Quincey knew, and of which this volume is the somewhat imperfect memorial, will have wholly passed away.

THE WEIRD SISTERS.*

THIS is by no means the kind of book which may be read with any comfort in a lonely house in the country late at night. It wants the blaze of a dozen gas-burners to support and cheer up the reader in the midst of the feast of horrors which is so bountifully spread before him by the author. We are not ashamed to confess that, as one night we were hastily skimming these three volumes in a long low room that was but dimly lighted, we began to feel in much the same state as was, on one occasion, the wicked hero of the story. "All throughout," we are told, "Grey saw at his left shoulder the Nemesis of his fate, and over the right the pallid face of his murdered victim." We will not, however, allow that our case was altogether the same, for to do so would certainly imply that we are gifted with a most tremendous squint. Nevertheless we saw over both our shoulders as much as any one can see who is looking straight before him and whose eyes are much as other people's. There was only one thing which could counterbalance to any extent the terrors of the narrative, and that was the wonderful absurdity of the language in which it is written. But it is not every one, we fear, who can derive this feeling of comfort, for it is not every one who can tell when a novelist is writing nonsense. We would therefore strongly recommend our country readers—above all, those of the fair sex—not to venture on this story till the days have grown much longer. If they do, they will repent it. The day will pass away, and night will come on. Let them not count on "the violet-purple brooding east" or "the full crimson activity of the splendid west"—we are merely borrowing from our author—or "the pale grey-blue of the northern plains," or "the green sky to the south," or "the pulse of liquid pink overhead." These are very pretty and comforting in their way, but they will not last. "The inviolate darkness" will come on; and what inviolate darkness can at times do they may learn from Mr. Dowling's pages. One night it was "so complete that it pressed with weight upon his (the hero's) eyeballs, and thickened the air in his lungs." On such a night as this they may by chance, as they go upstairs to their rooms, tread, like the hero, on a small piece of plaster which had fallen from the ceiling. How will they be prepared to control their feelings should it, in their case too, make "a sound like a wild beast crunching bones?" They may perchance walk through some passage where the wall-paper has been torn and hangs in shreds. What would they do if they were exposed to such terrors as was the hero, when "long slimy arms of paper stretched out to him from the wall and held him back?" Would not each of them, too, find, as he found, his gullet dry? A dry gullet can indeed be moistened; but what remedy can be found when the air rushing through a man's windpipe seems burdened with sand that tears the skin of his parched throat, when the arteries in his temple twang against the bones with noises that make him giddy, and when the uproar of strangulation is in his head? No moistening, no refreshing draught of porter can cure that. They next may find their face shrivelled up as the hero suddenly found his; or they may exclaim "Aha!" in such a strange way that some young baronet will at once say to them, as one said to the hero, "Did you ever hear the death-scream of a horse?" They may even go on still further, and rave as thus raved Mr. Grey:—

> *That* was the vulgar end of the coarse objective tragedy. That was the poison-bowl, the dagger-thrust. That was the breaking of the last bone on the wheel. I am dead since then. But *that* was only the bell for the curtain to go up on the other tragedy, the subjective play. I am enrolled among the immortals. I play the chief part in a tragico-farce by the Angel of Night. I play the leading part. The stage is in the nether depth. I play to an audience of everlasting Outcasts. The audience are assembled, the curtain is up. I forget my cue, and the prompter is asleep. Judas, I forget my cue, and the prompter is asleep. What am I to say? What am I to do, comrade Judas?

Our warnings, we fear, will be all to no purpose. With a large class of readers no hero is more popular than one who out-villains villany, while many derive a strange kind of pleasure from being sent scared to bed.

The story opens well, and plunges at once into the midst of horrors. The first chapter is entitled "A Conscientious Burglar." This worthy, it so chanced, had happened to break into Mr. Grey's house the very evening that that gentleman, highly respectable banker though he was, murdered his wife. The robber had seen the murder committed, and now came to demand a thousand pounds as hush-money. The banker draws out a revolver, and is going to shoot him dead, when the other utters a loud whistle. All at once a wild alarmed scream of a woman shot up through the silence, and, as though a blast had struck the banker's face, it shrivelled up like a withered leaf. While his face was thus shrivelled up, his eyes were fixed on vacancy. "He seemed to be listening intently, spell-bound by some awful vision, some distracting anticipation intimately concerned with appalling voices." Three whispered words slowly trickled from his lips—that is to say, he said, "What was that?" The reader is disappointed to find that, after all, there is no ghost, and that the distracting anticipation was not justified by the facts of the case. The scream came merely from the burglar's wife, and had been arranged beforehand in case of any danger befalling her husband. With such a "wealth" of villains is the story provided that we hear very little more of this worthy pair. Almost to the last page we had hoped that they would turn up at last and send the hero to the gallows. But hanging apparently was too good for him. He was meant for a more awful fate, and so the author was able to dispense with the further services of his conscientious burglar and his wife.

Let not the reader imagine that the interest of the story flags even for one moment as we close this first chapter. We are at once introduced to the scene of the murder and one of "The Weird Sisters" who give their name to the book. These were not women, but a pair of towers. One of them formed part of a vast pile that belonged to the family of a baronet. In the topmost chamber of that round tower had been found, ages before the story opens, the skeleton of a young lady, the wife of wicked Lord Stancroft, who at one time owned the estate. Ever since her death, "winter and summer, when there was sunshine at sunset, the top of that tower caught the reflection of the last red streak that flickered on the polished surface of the river." Mr. Dowling should have given us a map of the spot. Without it we find it not a little difficult to understand how the reflection from the setting sun can have struck the same place all the year round. However, there "the blood-red glare" was always to be seen; whether it came from the sunset, as the author says, or, as some thought, from the fire where the wicked dowager Lady Stancroft suffered for her great sin; or whether, as others thought, it was the reflection from the wreath of glory worn by the poor young wife. The other Weird Sister was part of the banker's own house. It was not unworthy of its rival. People spoke of it, we read, as a kind of phantom house. They treated it with a sort of superstitious respect, as a thing which might exercise an evil influence over those who fell under the shadow of its displeasure. To describe this place the author puts forth all the power which he possesses—and it is by no means inconsiderable—of writing arrant nonsense. In it a murder has to be committed, and therefore he labours hard for page after page to make it from the beginning as repulsive and disgusting a place as can be imagined. The scene of Macbeth's murder had, we remember, a pleasant seat, and a few lines described it; but Shakspeare and a modern novelist are wide as the poles asunder. Mr. Dowling first begins with the outside. We have gnarled boughs of oaks with huge green and red and yellow slimy weeds among the brambles and shrubs beneath them—no common combination of vegetable life, we undertake to say. "In the vast winds of the winters, when the oaks gored one another,

* *The Weird Sisters.* A Romance. By Richard Dowling, Author of "The Mystery of Killard." 3 vols. London: Tinsley Brothers. 1880.

and tore off the fangs of their antlers, great boughs fell with shrieks to the earth." We pass by vaults of sickly twilight, where vegetable nature held high saturnalia; shrubs damp with gelatinous dews; strange and depressing odours that filled the mind with hints of unutterable fears; fat reptiles that slipped in the ghostly moonlight; and we thank Heaven when at last we reach a pump and a horse-trough in the middle of a paved court-yard. There we take breath for a moment, but it is only for a moment, as the author at once plunges into a fresh flood of nonsense. In the very next page we come back to the park of gnarled oaks and rank lush undergrowth that was to the rear of all, and at the same time surrounding all. How a thing can surround all, and at the same time be at the rear of all is almost as puzzling as seeing Nemesis at the left shoulder and over the right a pallid face. Such was the place where the banker lived. The same year that he bought it he was appointed "caretaker to the fortune" of a baronet. This too-confiding gentleman rashly intrusted him with "half a million Consols," equal, we are told, to five tons weight of gold:—

About that time he read an account of a certain tree said to be in sympathy with a certain tower. The idea was fresh to him, and seemed to open up a new field of speculation, and he dwelt upon it a good deal.

One evening, as he was rowing from the Castle to his own home, a thought flashed into his mind. There was a striking coincidence in the fact of his being connected so closely with two such houses. Each was unpopular, each was weird, strange: there were queer stories about each, each had a tower. The tower of one had an unpleasant history connected with the skeleton of that poor Spanish lady; the tower on his house had that rusty framework of a tank that looked like a skeleton. "Might not," he thought, with a smile at the absurdity, "there be some sympathy between these two houses?"

The reader, if he has been properly moved by the author, will see no absurdity in the banker's thought. An iron tank on the top of a tower seems at first sight but a poor counterpart to a real skeleton; but then, as by this time we know, the tank was no common one. It had in its ruin been previously likened to the decay of the indomitable natives of America. It had become a tattered flag of distress. In it was stowed away, in the course of the story, the murdered body of the hero's wife. No wonder that even before this the whole building quivered with human horror, was silent with frozen awe; while "in your mental vision," writes Mr. Dowling, "the house itself seemed scared and afeared." What have the readers of such stuff as this, we may well ask, to do with mental vision? No doubt Mr. Dowling merely uses the word in a complimentary sense.

With such a house for his dwelling-place even the most virtuous banker could scarcely help falling into crime. The fates would have been too strong for him. The hero accordingly robs the confiding baronet of every ounce of his five tons of gold, and persuades the aged gentleman on his deathbed to leave him his sole executor. This he does, by the help of a scarcely less aged family solicitor, with great precision of language. "I hereby elect and appoint," his will ran, "Henry Walter Grey, of the Manor House, banker (hereinbefore described as Henry Walter Grey), executor and trustee." No sooner was the will made than the banker murdered his wife, and was ready to propose to the baronet's only daughter and heiress. Unhappily a cousin turns up, the heir to the title and landed estate. He had lived in Egypt, the land, we are told, of "the inexplicable Pyramids and the inscrutable Sphynx" (*sic*). Therefore, "the 'How d'ye do?' of her cousin came to her attended by veiled figures of strange aspect." The cousins of course fall in love. Grey for a while hopes to be yet too much for them. One night he goes out and "whispers to the leafless trees. 'Now, Mr. Prompter, ring down the drop. That's a very pretty end of the fourth act.'" But the fifth act begins very badly for him. His old mother abandons him, and persists in going into an almshouse. This alone was almost enough to ruin the soundest bank. The cousins are married. Grey gets together 20,000*l.* and intends to escape to Spain. First, however, he must burn down his house, and the tank that was a tattered flag of distress, and contained the body of his dead wife. No sooner had he set fire to the place than he became mad, and rushes, with a yell, up the noisome stairs to the tank. The flames cut off his retreat. For an hour and a half he keeps alive, in spite of them. At last the tank falls in through the burning roof. "With that tank the evidence against him had vanished." He at once becomes eager to escape, and calls for help. "Something warm struck his back." This last is really a little too much for us. The man had been an hour and a half on the top of a blazing tower, and now turns round because "something warm struck his back." We scarcely know whether, scoundrel that he was, he deserves the fate that the author awards him. For our part, we should have been quite satisfied had it been the story of his villanies, and not himself, that was pitched into the flames.

MOROCCO.*

READING Signor de Amicis's beautifully illustrated volume makes us marvel at the adventurous courage of men like Gerhard Rholfs who have made their way through the country without his advantages. Signor de Amicis travelled from Tangiers to Fez as the member of a mission from the King of Italy, which accomplished its marches under powerful escorts and was welcomed everywhere with apparent honour and hospitality. Yet what was most disagreeably impressed on the Italians was the malignant fanaticism of the natives, which is perhaps the more extraordinary since they are seldom brought in contact with the Christians they despise and detest. Half-naked santons turned out to curse the strangers; men scowled at them or shook their fists surreptitiously; and the women, boys, and children, who seemed to have less apprehension of penal consequences, actually mobbed them in the streets of the capital and pelted them over the heads of the guards in attendance. It is not surprising that the Signor formed no agreeable impression of the people, who would willingly have taken the life which they did their best to make a burden to him. The Berber mountaineers of the Atlas, of whom he saw but little, retain, he says, some of the manly virtues of savage races. Nor have the nomadic Arab tribes who pasture their flocks on the plains altogether degenerated from their ancient character. But in the Moors of the towns, who now monopolize the wealth and trade of the country, he found hardly any redeeming qualities. He tells us that they are truculent, avaricious, ignorant, insolent, superstitious, and grossly bigoted; and, in fact, if you were to load them with the abusive epithets they were ready to lavish so volubly on the Christians, you would be unlikely to do them any injustice. Nor is the debasement of their characters to be wondered at, considering the system of misgovernment under which they live. The tyranny of the Sultan is almost absolute, and only tempered by some regard to the prejudices of his subjects. He chooses his highest Ministers where he will, often selecting them from the lowest slaves of the palace, as was the case with the powerful vizier who received the Italian embassy. Sid-Moussa, however, chanced to be really a remarkable man, ignorant and unlettered but naturally shrewd, and a practised master of the arts of semi-barbarous diplomacy and intrigue. But he held his place and his life subject to the caprice of his master, who could unmake his creature and chattel with a word as he had made him.

The administration of Moorish finance is Oriental in the extreme, and its fundamental principles are corruption and oppression. The pay of the public functionaries is so absurdly small that it must be a matter of indifference to them whether it runs into arrear or not. Of course they remunerate themselves by bribes and high-handed robbery. Yet nowhere is the possession of riches more uncertain. The governor of a province squeezes the people and hides away the treasure he accumulates, for of course investments at interest are unknown. His enemies at court lodge accusations against him, which are sure to be well founded were there any question of doing justice; or the Sultan may be in pressing need of money. The governor receives an order to repair to the capital, or, more probably, is summarily arrested by soldiers sent for the purpose. At the capital he is thrown into a dungeon, loaded with chains, and put to the torture, till he consents to disgorge the amount of booty which it is calculated that he has probably pillaged in his government. Not unfrequently, we are told, these grasping malefactors cling to their prey with a constancy not to be shaken by the certainty of a horrible, though lingering, death. Their relatives have the secret of the hiding-place of the treasure, and so it remains in the family after all. Sometimes, under stress of circumstances, the Sultan levies on some district what used to be facetiously known in English history as a benevolence. If the people protest their inability to pay, or resolve in desperation to show fight, he lets loose on them two or three thousand of his half-savage horsemen, who rob on their own account while collecting for their sovereign; bringing back by way of trophies some sackfuls of heads, which are tastefully displayed over the gates of his city. It may be supposed that under these conditions of existence husbandry is rude and backward. The richest of the rural population are the tribes of pastoral Arabs, who own great herds of sheep and cattle. The peasants barely scratch the ground with a primitive plough, leaving it to rest from time to time by lying fallow. Signor de Amicis gives a suggestive little sketch of one of these rude implements, where a goat and a donkey yoked together are working in seemingly harmonious fellowship. Yet with all this general wretchedness and the precarious tenure of life and property, the Sultan, as we have said, has to pay a certain regard to prejudices. Signor de Amicis tells a curious story, the exactness of which he vouches for. An old woman of Mogador was knocked down by the horse of an English merchant, unfortunately breaking in the fall two of her front teeth. She carried her complaint to the Caid, insisting that two of the foreigner's incisors should be removed by the law of talion. Like the widow who beset the unjust judge in the parable, she persecuted the Caid day after day, till at length he represented the case to the Englishman, and implored him to submit. This our countryman positively declined to do; whereupon his victim set out on foot, and went with her plaint to the footstool of the Sultan. The vicegerent of Allah admitted the justice of her case, praying her at the same time to accept in compensation money sufficient to make her comfortable for life. It was all in vain, and finally he solved the difficulty by a more successful appeal to the other party. The merchant consented to part with his teeth in exchange for valuable privileges by which he amassed a fortune in a couple of years.

This anecdote is a good illustration of Signor de Amicis's style, which is invariably as bright and animated as his matter is full of information. He appears to have made his trip to Morocco as correspondent for an Italian journal, and his principals could hardly have made a better choice. He showed a lively interest in everything and everybody; studied character, for

* *Morocco: its People and Places.* By Edmondo de Amicis. Translated by C. Rollin-Tilton. London: Cassell, Petter, Galpin, & Co.

which he had ample opportunities in the variety of attendants and clients attached to the mission; and looked at the people, the scenery, and the cities from the picturesque as well as the prosaic points of view. Though they travelled with all available luxuries, it was a rough and hard life at best; but he bore the hardships with unfailing good humour. He had his own special anxieties in the circumstance that the art of riding does not seem to have been included in his education. Though he had singled out with much self-satisfaction the quietest mule among the animals provided, yet he had more than enough to do to manage it; and his equestrian embarrassments culminated when they made their entry into the narrow streets of Fez, among shouting Arabs and plunging horses. Provisions were supplied in abundance; they carried their own wine, and had very jovial dinners under canvas; but what they chiefly suffered from was the heat and the insects. Italians as they were, and tolerably seasoned, several of the party were altogether prostrated on the return march in the beginning of summer by the scorching sun and the stifling night atmosphere. As for the plague of venomous insects, that began badly as it went on, and never abated. Here is a picture of the pleasures of the mid-day "repose":—"Hardly had we stretched ourselves upon the ground when we were assaulted, stung, and tormented on every side, as if we had chosen a bed of nettles. Caterpillars, spiders, monstrous ants, hornets, and grasshoppers, big, impudent, and determined, swarmed about us. . . . Close by these was a monstrous spider's web, spread over some bushes like a sheet hung out to dry." Once the Signor witnessed the passage of a host of locusts in the shape of a distant field which appeared to be in motion; and one of the suite gave him a most vivid description of a really formidable invasion of these terrible scourges. Then there is nothing for it but resignation. The face of the country is covered; every green thing is devoured; while the stench that emanates from the myriads of dead sometimes breeds contagious fevers, and was followed in 1799 by a fearful pestilence.

On the other hand, the tedious march was enlivened by many picturesque incidents, though of course after a time these began to lose the charm of novelty. The Sultan had sent an escort of his own troops from Fez under the command of one of his generals. Hamed Ben-Kasen, by the way, was a model Moor. He was invariably in good temper; never bullied his men; was up and about early and late; showed himself seemingly perfectly contented on his pay of forty francs a month; and was ready to turn his hand to anything from buckling the girths of a pack-saddle to driving a tent pole. But besides Ben-Kasen and his men, the governor of each town they traversed was bound to meet them on the frontier with a mounted contingent of cavalry, and to remain in attendance to the opposite frontier. These wild horsemen, often well mounted on under-sized horses, though very indifferently armed, delighted to go through their warlike exercises before the strangers, charging, wheeling, firing off their matchlocks, and affecting to take to flight after a hot pursuit. Naturally their moral characters were none of the best; some of them belonged to tribes who have organized robbery into a profession, distributing its departments among the different members of the community; but they were stalwart in their make and martial in their bearing, contrasting favourably with the regular troops of the Sultan, who seemed to be drawn from the dregs of the people, and numbered many boys in their ranks. Then there was the solemn presentation of the *muna*. The *muna* is a tribute in provisions which the inhabitants are compelled to furnish to all guests of the Sultan who pass through their districts. On the first occasion, the head-man of the place came forward, followed by a long file of Arabs, who "deposited at the feet of the Ambassador a great quantity of coal, eggs, sugar, butter, candles, bread, three dozen of hens, and eight sheep." These contributions in kind were all very well so long as they were cooked by the European *chef* of the mission. But Signor de Amicis could never reconcile himself to the Moorish cookery, which he had too many opportunities of appreciating at official banquets, and of which he gives a most entertaining description. One of the *menus* included "twenty-eight enormous dishes, without counting the sweets, any one of which would have been enough for twenty people, of all forms, odours, and flavours; monstrous pieces of mutton on the spit, chickens (with pomatum), game (with cold cream), fish (with cosmetics), livers, puddings, vegetables, eggs, salads, all with the same dreadful combinations of the barber's shop." The Mission had no reason to complain of their reception at Fez. The Sultan, who was extremely prepossessing in appearance, was gracious in the extreme; his Ministers imitated their master's affability; and, though mean externally, the palace prepared for the Mission was spacious and almost sumptuous in its internal accommodation and architecture. But the Signor was dismally struck by the aspect of the city, of which he gives a feelingly graphic description. It is a labyrinth of dilapidated streets and lanes, with blank windowless walls, encumbered with bones and bodies of animals and heaps of decaying putridity. "In some places the ground is so broken, the dust so thick, the smell so horrible, the flies are so numerous, that we have to stop to take breath." No wonder that in so foul an atmosphere and with such depressing surroundings they should have lost health before their departure, and longed for a change of scene and for the open country, when the novelty of their first impressions had worn off.

We must conclude our notice of a fascinating volume with a word of warm praise for the comprehensive and admirable illustrations, which are executed with extraordinary spirit, and, as we should imagine, with great fidelity. The translator, too, seems to have performed his part of the work with much ability; and the book altogether is to be strongly recommended.

CLÉMENT'S MICHAEL ANGELO, LIONARDO DA VINCI, AND RAFFAELLE.*

THESE biographies come before the English public with accumulative credentials. When the first French edition appeared, nineteen years ago, the criticism on Michael Angelo was pronounced the best among the very many that had been attempted. And yet these lives of the three most distinguished artists of the Italian Renaissance have since slumbered on the library shelves of the select few, and probably would not have been brought prominently into light had it not been for the warm encomium of an English Academician. Mr. Poynter in his lectures pronounces "these three notices remarkable, not only for the beautiful spirit in which they are written, but for the justice with which the three characters are compared and analysed." Speedily following on these words, the well-nigh forgotten volume appears in an English garb; and the public are also informed that the notice of Michael Angelo will come out separately in renovated form. Seldom has a short paragraph proved of such advertising power, and fortunately the wares thus offered to the public are of intrinsic and permanent worth.

Michael Angelo, a stumbling-block for three centuries, has been literally encumbered by criticism. Sir Joshua Reynolds somewhat servilely declared that "to kiss the hem of his garment, to catch the slightest of his perfections, would be glory and distinction enough for an ambitious man." Fuseli said that "sublimity of conception, grandeur of form, and breadth of manner are the elements of Michael Angelo's style." Mr. Harford followed in feebler strains of eulogy. Duppa, whose life was pronounced thirty years ago to be "wholly satisfactory," writes:—"The genius of Michael Angelo was vast and wild, by turns extravagant and capricious, rarely to be implicitly followed, but always to be studied with advantage." Grimm, in his highly-coloured biography, places Michael Angelo side by side with Dante and Raffaelle, a triumvirate of the greatest men produced by Italy; "it is art alone which marks the prime of nations." Within comparatively recent years a reaction set in; the Pre-Raffaellites of England and Germany chose their objects of worship from prior historic periods, and Mr. Ruskin, their apologist, has made it part of his mission to run down the Tuscan Titan. But his accusations fall too far from the mark to be worth notice. Mr. Poynter, however, has taken up the cudgels in defence of the great sculptor, architect, and painter of the Italian Renaissance; a timely appeal is made to M. Clément, and the judgment delivered does but confirm the verdict of three centuries.

A connected scheme runs through these triple biographies. "The grand era of modern art, the wonderful epoch of the Renaissance," forms a general background, whereon are grouped in agreement and in contrast Lionardo da Vinci, Michael Angelo, and Raffaelle. The literary style is sparkling, even florid, and yet high-sounding sentences are usually sustained by solid thought. Novelty of view would be too much to expect from criticisms which are now nineteen years old, and yet we recur with pleasure and advantage to well-balanced judgments of character, and to vivid historic panoramas. The generalizations are broad and deep, and pointed epithets give a surface brilliancy. The author speaks of the dark ages and the approaching dawn as "a painful period," "a mysterious twilight separating the Renaissance from antiquity," "events following each other without appearing to be connected, drifting at random, as though floated on by a vast stream without guidance and almost without a current. Their progress is uncertain, fitful, obscure, and, like the blind elements, often conflicting, and so we cannot be surprised that the arts should share their fate." M. Clément advancing to the sixteenth century shows how Michael Angelo "broke away from the traditions of the liturgical painting of the middle ages," and likewise stood aloof from classic sculpture. His manner was individual, original, defiant. Marble coming from his chisel no longer expressed beauty simply in an abstract and general manner; carved by a powerful, intelligent hand, it translated ideas and feelings. "The Moses of Michael Angelo beheld God, heard the voice of thunder, and bears the terrible impress of what had been seen on Mount Sinai." "To speak, to strike, to convince, was the sculptor's object; no one cared less to please by small means; when he had said enough he said no more, accordingly he subjugated rather than charmed or beguiled." But M. Clément is too well trained as a critic to deal out unmixed praise, and in terse phrases he assigns limitations to the huge proportions of his hero. Michael Angelo's architecture is designated as "coldly scientific." The fresco-painted ceiling of the Sistine is termed a "painful poem of humanity," "a tragic heaven peopled with gigantic forms." The "Last Judgment" is spoken of as "one of those unheard-of productions of the human mind which, in spite of all criticisms, appal and overcome"; the artist "piles up difficulties, violent postures, extreme pantomimes," "making a kind of rhetoric of his art." Michael Angelo

* *Michelangelo, Lionardo da Vinci, and Raphael; with a Preliminary Chapter on Art in Italy before the Sixteenth Century.* By Charles Clément. Translated by Louisa Corkran. With 8 Illustrations. London: Seeley & Co. 1880.

has been called "the man of four souls," divided, though unequally, between the sister arts of architecture, sculpture, painting, and poetry. Of painting he himself said, in discourse with Vittoria Colonna, that it "approaches God, unites with Him, is a copy of His perfection, a shadow of His brush; in short, a music, a melody." This odd anticipation of the fantastic style of a modern school of art criticism reminds one that there is nothing new under the sun. We have to thank Mrs. Corkran for the lucid and vigorous English of her translation, which reads indeed like an original. M. Clément concludes as follows:—

Such was Michelangelo, the last and greatest of the severe masters. This gigantic figure closes and sums up in himself the movement inaugurated by Dante and Giotto, carried on by Orcagna, Brunelleschi, and Lionardo da Vinci. Surpassed, no doubt, by several of his contemporaries or predecessors in some of the arts he cultivated, this proud and sombre genius stamped on all his works a formidable impress. It may be said of him that he had no ancestors, for he so immeasurably excelled his predecessors that, no matter what he may have assimilated from his age, he had all the characteristics of those exceptional beings who owe to circumstances nothing but the possibility of freely developing their extraordinary faculties. . . . It was not alone by the creative energy of his all-powerful imagination, but by an unparalleled union of the highest and rarest faculties, that he outstripped the celebrated men of that prodigious epoch. Painter, sculptor, architect, engineer, poet, citizen, he appears a Titan beside Dante, Lionardo, Brunelleschi, Raphael, the last scion of a lost race, dominating this army of giants. And, since his character was on a par with his genius, are we not right in assigning to him the first place among the great men of the modern era?

We will briefly bring down the literary history of the subject to the present date. M. Clément, in common with other writers twenty years ago, deplores the non-publication of numerous and important manuscripts; and he wrote without access to the Buonarroti collection in Florence, or to the letters and other documents since acquired by the British Museum. But certain of these letters appeared as far back as 1863 in Grimm's Life of Michael Angelo; and twelve years later, on the occasion of the fourth centenary of the artist's birth, the Buonarroti archives were at last presented to the world. The festival and imposing procession through the streets of Florence were supplemented by formidable literary products; a bulky volume was brought forth, comprising the Buonarroti archives, the letters in the British Museum, and other documents; and occasion was also taken by Commendatore Gotti to rewrite the life of the artist "with the aid of the new documents." A year later, in 1876, Mr. Charles Heath Wilson published an English version of these literary treasures in a new Life of Michael Angelo, which was reviewed in our columns. Since then the Germans have again set to work, and Herr Anton Springer elaborated yet another Life which at once acquired a reputation. Herr Grimm, too, who comes to his renewed labours with a vested interest in the subject, is now incorporating the fresh materials in a revised edition of his well-reputed biography. Thus it will be easily understood that the name of Michael Angelo will not be permitted just yet to rest from controversy.

The second figure in this historic trio, that of Lionardo da Vinci, stands in full relief, and we are enabled to view its fine proportions from all sides. The old facts have been thrown into new lights, but the colouring is, we think, somewhat false. Too much stress is laid on the epicurean aspect of the artist's character. Lionardo is depicted as a self-indulgent man, restless, inconstant. He guessed indeed at the greater part of modern discoveries, but "he did not penetrate deeply into the moral world. The works of Lionardo, elevated and perfect, astonish, captivate, and trouble, but do not stir the depths of the soul." In like depreciatory strains M. Clément protests against the notion that Da Vinci stands as "the most elevated, the most consummate representative of religious art." "The author of the 'Last Supper,'" continues this withering censor, "was neither liturgical, nor Christian, nor religious in any degree. The religious thought is utterly absent from all his works." We need scarcely say that this judgment is counter to the all but unanimous opinion of mankind. And yet this French expert with a specious eloquence sweeps away all that stands in his path. The following rhapsody on Da Vinci's portrait of Mona Lisa in the Louvre is hardly a model of sober criticism:—

This voluptuous, charming image of Mona Lisa has lived for three centuries. Millions of men of all ages and languages have crowded round the narrow canvas. They have been kindled by the rays of those limpid, ardent eyes. They have carried the poisoned dart in their hearts to the four corners of the world. As long as any vestiges remain of this marvellous and fatal beauty, all those who seek to read the mysteries of the soul upon the features of the face will come in anguish to inquire of this new sphinx the solution of the eternal enigma. Lovers, poets, dreamers, go die at her feet! Your despair or your death will not efface that enchanting smile from that mocking mouth, that implacable smile that promises felicity, that will never give happiness.

Raffaelle, like his compeers, is skilfully brought upon the scene with a dramatic sense of the situation. The artist at his birth inherited the sanctity of the religious school of Umbria; "his graceful, facile, happy nature received and developed the germs," while "the elements of a new civilization" in Tuscany brought him daily nearer to naturalism. This analysis, to which in the main we have little to object, follows closely on the method propounded by a brother critic, M. Taine. The formula may be briefly stated thus:—first, given the genius of an artist, and secondly his surroundings, his works follow under the law of cause and effect, almost of necessity. Without caring for the moment to examine the universality of this doctrine, we may at once admit that it receives a certain amount of confirmation in the career of Raffaelle. The sketch offered by M. Clément is tenderly handled. "The delicate feminine nature" of Raffaelle contrasts strongly with "the two athletes of Tuscan art," Michael Angelo and Lionardo. "Guided by an admirable instinct for beauty, which was his true genius, Raffaelle understood all, assimilated all, transformed all into consummate works." In a well-known passage the painter mourns over the paucity of beautiful models, and says that he therefore cherishes a certain ideal in his mind. "I do not know," he adds, "if this idea has any excellence in it, but I strive to realize it." We have always thought that this ideal beauty served as the keynote to Raffaelle's art. Hence he has sometimes won the epithet "divine." We may add that, notwithstanding all that has been well written about him, much more remains to be said. Passavant, in his Life, is far too credulous to be strictly critical. On the other hand, Messrs. Crowe and Cavalcaselle, who are now engaged in the detailed study of the life and works of Raffaelle, will certainly not fall into weakness for want of scepticism. The reader may gather, from all that we have said, that the new materials which have been rapidly accumulating will impose upon M. Clément the not unpleasing duty of amplifying and rewriting these brilliant pages on Michael Angelo, Lionardo, and Raffaelle.

MINOR NOTICES.

MR. BRET HARTE'S latest story (1) is full of the dash and the humour, not unmixed with pathos, by which he first won his way into the position which he occupies in contemporary literature. Jeff Briggs is a young man who is landlord of a tumble-down little inn in Calaveras County. His aunt, who keeps house with him, and whose character is lightly and skilfully sketched in, has been deploring the lack of custom, when the accident of a storm sends three visitors to the hotel, if hotel it can be called, in the person of a Mr. and Mrs. Mayfield and their daughter. Jeff going out to bring the daughter in from the stage-coach through the swamp caused by torrents of rain, takes her for a child, and treats her like a child, and is horrified when in the indoors light she is revealed as a young woman of twenty-five. The stage is driven by that old and valued acquaintance of all Mr. Bret Harte's readers, Yuba Bill. Jeff of course falls desperately in love with the girl whom he has carried out of the coach, and equally of course Yuba Bill takes him severely to task for his folly, and counsels him to "git." This is the bare outline of the beginning of the story, which is filled in in Mr. Bret Harte's best manner. There are conversations between Miss Mayfield and Jeff in which the hero, unfortunately for him, follows Yuba Bill's advice instead of his own instincts. He leaves his inn, wanders far afield out of reach of all his friends, and is in the depth of misery when he is offered an appointment, which he at once accepts, as treasure-messenger for a large bank between Robinson's Ferry and Memphis. The post is one of obvious danger, as the route is infested with "road agents" or highway robbers. Yuba Bill has meanwhile taken charge of the coach on which Jeff is to travel, and comes into the office asking for the fool that Wells, Fargo, and Co. have sent up to carry their treasure, "because I'd like to introduce him to the champion idjit of Calaveras County, that's been selected to go to h-ll with him, and that's me, Yuba Bill." When he recognizes Jeff, "'It's a lie,' he roared, 'or somebody else has been putting up a job on ye, Jeff!' Because I've been twenty years in the service and am such a nat'ral born mule that when the company strokes my back and sez 'You're the only mule we kin trust, Bill,' I starts up and goes out as a blasted wooden figger-head for road agents to lay fur and practise on, it don't follow that *you've* any call to go.'" However, Jeff and Yuba Bill start together, and on the way Bill points out that the most likely place for an attack is one where it is not altogether desirable to try the manœuvre of driving on hard all past the robbers, because the road is skirted by a precipice, and if one of the horses gets shot and falls the "coach turns sharp off and down we go, the whole kerboodle of us, plump into the Stanislaus!" To which Jeff replies quietly, "And they don't get the money," much to Yuba Bill's admiration. What Yuba Bill prophesies comes to pass, but he, generously sacrificing himself, so manages that he is taken for the treasure-messenger, and draws the first fire of the robbers. The coach, however, is surrounded, and Jeff only escapes by dropping, as if by chance, the wick of a lighted lamp on the haunches of the wheelers, which sets the whole team off in a wild gallop:—

A dozen shots followed them. The men were protected by the coach, but Yuba Bill groaned.

"Are you hit again?" asked Jeff hastily. He had forgotten his saviour.

"No; but the horses are! I felt 'em! Look at 'em, Jeff."

Jeff had gathered up the almost useless reins. The horses were running away; but Blue Grass was limping.

"For God's sake," said Bill, desperately dragging his wounded figure above the dash-board, "keep her up! *Lift her up*, Jeff, till we pass the curve. Don't let her drop or we're———"

"Can you hold the reins?" said Jeff, quickly.

"Give 'em here!"

Jeff passed them to the wounded man. Then, with his bowie-knife between his teeth, he leaped over the dash-board on the backs of the wheelers. He extinguished the blazing drops that the wind had not blown out on their smarting haunches, and with the skill and instinct of a Mexican *vaquero*, made his way over their turbulent tossing backs to Blue Grass, cut her traces and reins, and as the vehicle neared the curve, with a sharp

(1) *Jeff Briggs's Love Story; and other Sketches.* By Bret Harte. London: Chatto & Windus.

lash, drove her to the bank, where she sank even as the coach darted by. Bill uttered a feeble "hurrah!" but at the same moment the reins dropped from his fingers, and he sank at the bottom of the boot.

This is an exciting scene enough, and it is Mr. Bret Harte's merit that after it he never allows the interest of the story to flag till its end. How that end is reached we may leave readers to find out for themselves. The other story in the volume is a good instance of the author's power of mingling pathos and humour, and the paper which ends it, called "Views from a German Spion," is interesting and pleasant.

Very few, we fancy, of those who can most glibly run off Scott's recommendation to visit Melrose Abbey by the pale moonlight have a clear notion how it looks in that sunlight under which alone all peculiarities of plan and minutiæ of detail can be appreciated. Mr. Pinches (2) has come to the assistance of those who desire to study this church systematically by publishing carefully measured drawings of it, including plan, sections, elevations, details, and prospectuses of a folio size, which won the silver medal of the Royal Institute of British Architects. Unfortunately he has not completed the series so as to make it a sufficient monograph of an interesting minster of the second class, belonging to a Cistercian Abbey which was founded in the thirteenth century in succession to the famous Culdee monastery of Old Melrose. The actual church, in Late Pointed—of which so much remains that its restoration, either on paper or in fact, would be a matter of constructive certainty—is remarkable for the combination which it exhibits of the Flamboyant of France and Scotland and the Perpendicular of England, a peculiarity to be accounted for by its border site. The letterpress is disappointing, for Mr. Pinches has not realized that Church architecture requires for its explanation accurate history and some knowledge of ceremonial; and he has the habit of running off into generalities only suitable to an immature age of archæology. Among the existing remains are the mass of what was once the choir or rood screen, standing, according to Cistercian practice, at a considerable distance (in this case three bays out of eight) down what is the architectural nave. We should have thought that at this time of day this feature would have been self-explanatory to any architect who undertook to draw and explain a Cistercian minster. Yet Mr. Pinches first hazards the extraordinary notion that it was built to inclose the church at this end while the rest was being rebuilt—and, it must be presumed, was forgotten to be pulled down—and then he gravely balances between its being "the great organ screen" and what Mr. Walcott calls "a rood screen," though it is fair to say he concludes in favour of the latter, but for the extraordinary reason that he finds the head of our Saviour carved on the boss of its doorway. It seems even more remarkable ignorance that a writer who finds himself face to face at a Cistercian Abbey Church of St. Mary with statues of Our Lord in Majesty ("some King," according to Mr. Pinches), and of the Blessed Virgin over the east window, should gravely inform his readers that they cannot be those of the Scottish "King David and his wife," and are more probably those of "King James IV. and his spouse," who were married at Melrose. A representation of the Trinity on one of the bosses is "a sitting figure supporting our Saviour on the Cross," and a carved sword signifies the tomb of a "Knight Templar." All this is on the level of the blunders of eighteenth-century antiquaries.

In *The Irish Agitator in Parliament and on the Platform* (3) Mr. Bagenall offers in a compact form a careful and readable history of Irish political agitation during the past year. We can recommend it to those who desire to clear their ideas upon a very repulsive and intricate, but increasingly important, episode of contemporary history.

There is no lack of cookery-books nowadays; but nevertheless this unpretending and useful little volume (4) distinctly supplies a desideratum. Mrs. Frederick's book is "not addressed to those who have to cook for themselves, nor to persons who can afford to keep a *chef*, but to the very large class of housekeepers who, though not poor, are obliged to study economy, and who, while employing female cooks of the kind usually called 'plain,' are desirous of enjoying well-prepared and tastefully-arranged meals." To this rather important class these "Hints" may be safely recommended as worth studying. The author steadily keeps in view the simple aim of "making everyday meals at home, particularly the dinner, attractive, without adding to the ordinary household expenses." "A few American recipes" are given in the last chapter.

Mr. Frost's volume (5) has a misleading title. He was in Kent with Charles Dickens, as he might have been in Kent with Shakspeare, or with any other writer from whose works quotations having reference to Kentish places could be extracted. The volume is really a record of a commonplace walking tour in Kent, illustrated by constant reference to Dickens's writings, and diversified by skimble-skamble conversations and stories which cannot be called brilliant.

Mr. Joseph Kindon (6) publishes "this volume of my poems with a mixture of diffidence and confidence. . . . It is not for the poet to criticize, and a perfectly unbiassed judgment on his own works is, least of all, to be expected of a man glowing with creative imagination; it is for the poet to produce, and to have as little of the negative faculty about him as is consistent with exact and clear expression. If any one doubts, from my poetry, whether I have this claim to creative imagination, I myself have so little doubt of its possession, that I make it my defence for publishing this book." We must confess that the defence does not strike us as particularly strong, and that we have enough of "the negative faculty about us" to make us deny that "thoughts" rhymes to "resorts." Nor does this, for instance, seem to us a strikingly happy example of "exact and clear expression":—

> Yet ere the setting of the sun
> The rain has ceased, the clustered leaves
> A softer lustre have put on,
> While the still-listening air receives
> The clear full notes
> Hailing gold-clouds as past each one
> A cloud-veil floats.

As to Mr. Kindon's dramatic sketches, he tells us that they do not pretend to display any stage-constructiveness, or fitness for representation, "but when the interest turns on character, a dramatic form is obviously an advantage; it abridges description, and raises a gently harmonious illusion in the mind of the reader." One of the "dramatic sketches," called *Ravenswood*, is founded on the *Bride of Lammermoor*. One of the scenes takes place in Hades. The author describes its opening thus:—"At a cloud-built table, with imaginary viands on it, the spirits of Lord Ravenswood and several ancestors; also the spirits Revenge, Wrath, and Lust; Charon presides." If the viands are imaginary, the drinks are not, for presently "they drink fire, which courses through them; the others shudder." Then Mr. Kindon attempts to "raise a gently harmonious illusion in the mind of the reader" by such astounding stage-directions as these:—

> An army is seen marching to martial music, their looks noble and defiant; suddenly all the horrors of a battle are seen, and the music changes to discord.
>
> Children are playing in fields; suddenly they are grown men and women, drinking and wrangling in gaudy tap-rooms.
>
> An orator is stirring a crowd to patriotism; suddenly it is dark, he is taking a bribe with one hand, and unfastening the city gate with the other.
>
> A preacher is seen exhorting a congregation to holiness; then they are seen to separate and speak poisonous words, at which the hearers sicken; they handle false weights, bad books, &c., they are seen stealing opinions from others, putting their hands into the hearts of others and crushing out tender feelings; selling the opinions afterwards as their own.

If Mr. Kindon does not seem to us to be "glowing with creative imagination," he has at least a great gift of unconscious humour.

Mr. Besant's excellent Life of Coligny (7), which we noticed some time ago, has now reached a second edition, in the preface to which the author makes some pertinent remarks. He says, amongst other things, that it has been his special aim to show Coligny "as a man very far in advance of his age"; and this he has certainly succeeded in doing. On looking at the book again one is struck anew with its commendable mixture of enthusiasm and judiciousness.

Mr. Gilkes hopes "that the publication of these essays (8) may in some degree serve education; but I publish them diffidently and sadly, for I do not think that they offer to education the kind of help which it most needs." Whether this is so or not, there can be little doubt that Mr. Gilkes has done well in publishing them. They are written in a style which can hardly fail to make them attractive to intelligent boys. There is not any more suspicion of trickery or affectation in the writing than there is of pedantry. The hearers are not talked down to; their sympathy and attention are enlisted by perfectly sound and legitimate means; and it is hardly possible that they can have found any of the lectures dull, or left any of them without carrying away something to think about. These lectures can be thoroughly recommended for their especial end as well as for more general purposes. Mr. Gilkes in his preface takes what will strike many as a pessimistic view of the state of education in very great schools; but it is only fair to remember that he speaks with knowledge gained from observation of at least one case. At any rate, he has done good service to his cause.

Dr. Lauder Brunton's name is warrant enough for the value of the lectures which he has reprinted in the volume called *Pharmacology and Therapeutics* (9), and to which it would be out of the question to do anything like justice in a short notice. We must be content then, for the present at least, with setting forth the object of the book as it is clearly defined in the preface. Under the new name of Pharmacology Dr. Lauder Brunton endeavours to show how the progress of therapeutics is aided by a knowledge of the action of drugs attained by experiment. The method which he adopts for carrying out this intention is that of pre-

(2) *The Abbey Church of Melrose, Scotland.* Illustrated by Frederick Pinches, Architect, A.R.I.B.A. London: Published by the Author.

(9) *Pharmacology and Therapeutics; or, Medicine Past and Present.* The Goulstonian Lectures delivered before the Royal College of Physicians in 1877. By T. Lauder Brunton, M.D., &c. London: Macmillan & Co.

senting the reader with a concise summary of the various modes in which the study of medicine has been pursued in the past, and by pointing out the errors of these different modes, and so arriving at an estimate of the proper value of all the branches of medical science.

Mr. Skinner's digest (10) is careful and accurate, and may be of great use to investors.

A second edition has appeared of Mr. Taswell-Langmead's *English Constitutional History* (11), which first made its appearance some four or five years ago, at which time it was reviewed at length in these columns. The author has now carefully revised his work, and has also made some additions to it.

The usefulness of Mr. Smith's carefully arranged manual, which deals exclusively with Admiralty law (12), is at once obvious. The author has done well in giving authority for every statement, with, as he says, "the twofold purpose of enabling the reader to test its accuracy and directing him where fuller information may be gained."

A fifth edition has appeared of Mr. Snell's valuable *Principles of Equity* (13), thoroughly revised and noted up to date by the editor.

One of the most attractive of the series of "Chandos Classics" (14) is found in a new and convenient edition of that delightful book, White's *Selborne*. Mr. Davies may be congratulated on his share in the work.

Mr. Dixon has fitted himself for the task of writing his bright and pleasant volume on Bird Life (15) by close and constant observation of the creatures with whose habits he deals; and the result is naturally a freshness and vividness of style which is not too common in books treating of natural history subjects. "Had I," he says in a preface, "spent more of my time amongst books instead of amongst bogs, I have no doubt but what this little volume would have found more favour amongst a certain class of naturalists, no matter how questionable or erroneous the matter it contained." Whether Mr. Dixon is right as to this or not, it is, we think, tolerably certain that the excellence of the method he has adopted will be widely appreciated by amateurs. We must not close this brief notice of a very attractive book without a word of praise for Mr. Pearson's wood engravings.

The late Mr. Hain Friswell's writings now appear in a collected form in eight volumes (16), which are admirably printed and got up, and which should be welcomed by all Mr. Friswell's admirers.

The invaluable *Dod* (17) makes a forty-eighth appearance this year, and is as invaluable as ever. It is a weakness of human nature to delight in finding imperfection in what seems perfect, and we could not but feel something of this weakness when we discovered that *Dod* contained at least one small slip.

We have received the seventeenth annual issue of the *Statesman's Year Book* (18).

Mr. Stanford issues "Mathieson's Map of the Railway Systems in England and Scotland corrected to January 1, 1880." It is reduced from Mr. Price Williams's standard map, and compared with Mr. Airey's "Railway Junction Diagrams." Its special value lies in the accuracy and clearness with which it shows the running powers of each line over other lines, while the district belonging to each Company is carefully marked out.

THE EXPLOSION IN THE WINTER PALACE.

THE latest attempt on the CZAR's life is much the most appalling and horrible that has been made. It is not only that for a fourth time within a twelvemonth the life of the CZAR has been threatened. That alone would be awful enough. But in this instance the foes of the CZAR are those of his own household. Even in his own home his life hangs on a thread. It is difficult to conceive any human being leading a life less worth living than the Emperor of RUSSIA lives at this moment. He walks in what might seem to be the safest of all places, and an attempt is made to assassinate him. He goes by train, and an attempt is made to assassinate him. He is just sitting down to dinner with his only daughter, and an attempt is made to assassinate him. And to the man himself it must add an extra drop of bitterness to the cup of his affliction that he does not deserve his fate. He is not a bad Czar, and no one pretends that he is a bad Czar. It certainly is not saying much for him, but he may safely be said to be the best of his line. He can neither walk, nor travel, nor eat in safety, simply because he is Czar, and represents a detested Government. And he seems to have no safeguards. His statesmen, his generals, his soldiers, and his police can do nothing to protect him. His whole Empire is in a state of siege, and his military governors are as useless to him personally as so many babies could be. Even intelligence received beforehand of a plot against him is no protection. For months it has been announced that something very dreadful was going to happen in the Winter Palace. His guardians were forewarned, and yet the dreadful thing happens in the Winter Palace just as if no warning had been given. In fact, one half of the inhabitants of the Winter Palace must have been conspiring against the other half. It is said that just before the explosion forty arrests were made in the Winter Palace; and, if forty were arrested, and yet enough remained to carry out the long-prepared design, it is difficult to set any limits to the imagination when it is attempted to picture the cruel treachery which must pervade the circles where fidelity would have seemed most assured. The material used appears to have been dynamite. This material must have been procured; and how could it have been procured except by persons of extraordinary influence, who had the command of military stores, or could get it smuggled into the country? The material had to be conveyed into a cellar, and the approach to every cellar was, we are told, jealously guarded. The explosive material was ignited either by electricity or by a long train reaching into an outer court. No one could have introduced a battery or laid a long train in an outer court of a palace where every movement was supposed to be watched, unless possessing some authority, or holding some station which would forbid any close inspection of what was being done. The new attempt differs from the previous attempts on the CZAR's life in many important respects. It cuts off from the CZAR the last refuge of a hunted man—the refuge of home. It must have been made by the combined efforts of a great number of persons. Those persons must have been in the group of the CZAR's household servants, and there must have been among them some, at least, possessed of recognised influence and station. It is too soon as yet to offer any decided opinion on the character of the enterprise, but it looks, so far as can be judged at present, less like an outbreak of the revolutionary spirit than the intended beginning of a real revolution. Its authors must have planned what they would do in case of success, and they must probably have speculated on the possibility of setting up a Government to their own liking, instead of being contented, like ordinary Nihilists, with trying to make all Governments impossible.

One little ray of light is thrown over the darkness of this terrible event by the intrepid bearing of the Duchess of EDINBURGH in the hour of peril. It is satisfactory to know that the wife of an English Prince behaved in a manner worthy of the family in which she was born and of the family into which she married. Otherwise there is nothing to lessen the gloom and horror which this new attempt on the CZAR will inspire here and throughout the civilized world. Every honest man out of Russia will express a genuine horror of the crime, and a Vienna journalist has already proposed to declare the perpetrators out of the pale of humanity. We have no kind of objection; but the question suggests itself whether they would care a straw whether they were declared to be out of the pale of humanity or not. Will they be declared out of the pale of Russian society? Will they be regarded as persons who have tried to do something equally useless and wicked, or as persons who have tried to do something which cannot indeed be wholly approved, but which has its patriotic side? This is a question most difficult to answer; but a considerable amount of testimony, which seems to be independent and tolerably trustworthy, points to the conclusion that there is a very large portion, possibly the majority, of Russian society which has got beyond Nihilism. It has not, of course, got beyond it in the downward direction, for that would be impossible. Men cannot aim at a blank beyond nothing. But it has got beyond Nihilism in the upward direction, and aims at something. It finds that all law has been superseded by military government, and it asks that law may again prevail. It finds the country groaning under an intolerable burden of taxation, and it asks that the nation should have some real control over its expenditure. It finds robbery and corruption predominant, and it asks for some approach to official purity. It finds dummy Ministers, isolated from each other, and all surrounded by Palace favourites. It asks for Ministers who will have real power, who will act together, and who will communicate directly with the CZAR. But, above all, it asks for a decent amount of personal security. In order to realize the possible mental attitude of Russians who are by no means Nihilists towards the contrivers of the explosion, we must first realize how completely such Russians are without any personal security. Even if they do their utmost to please the Government, they still are not sure of being safe, for the new system has broken down, and the Government can protect neither itself nor its friends. Every action of their lives is watched by spies, who may be as stupid as spies usually are, but whose very stupidity may be dangerous. At any moment any one may be sent to the Eastern provinces or Siberia. This, indeed, is the ordinary lot of Russians, and to a certain extent they have got used to it. But they used to feel that this extra-judicial punishment was only decreed by supreme authority, by the CZAR himself, for what were supposed to be real reasons of State. Now they feel that they are at the mercy of a set of Court favourites who have been scattered over the Empire to show their activity, and who naturally

show it by being active with reason or without. Thus to many Russians the explosion in the Winter Palace may seem to have been only a blow struck in self-defence. It may be assumed that the real question was whether the conspirators or the Government could get the start, and those who live in daily fear of the Government may secretly wish that even people who were ready to do something cruel and wicked had got the start of such a Government as they think theirs to be.

If there is this amount of disaffection, and of disaffection which may to a certain extent be called reasonable, in Russian society, and if the present system has broken down—and it has broken down beyond question—what is the unfortunate, right-minded, bewildered CZAR to do? He may end the state of siege, and concede liberal institutions, is one answer. He may abdicate, and let his son do what he cannot do himself, is another answer. He may continue the present system, and strive to make it effectual, is a third answer. He may get up a new war, is a fourth; and the vast tribe of Bismarckian journals strive to persuade Europe that this is the answer that will probably be found to be the one really given. That he will suddenly turn himself into a constitutional monarch seems most improbable. A Czar who became constitutional all in a moment through sheer personal fright would not be a Czar at all. If he worked gradually, he would not be trusted; and if he seemed to own that panic had driven him into reigning, instead of governing, he would be an object of contempt, and would plunge Russia into anarchy. Russia is not in the least fit for popular government. There are no trained constitutional statesmen, there are no officials to be found who are at once pure and capable, there is no pervading common sense in the educated classes, there is no well-to-do peasantry, there is no communion of thought or interests between the large landowner and the small cultivator. LOUIS XVI. was in about as much of a position to found a constitutional monarchy after he had been visited at Versailles by the fishwives of Paris as the CZAR would be immediately after he has escaped dying at his own dinner-table. The only reforms that would suit Russia are small, gradual, tentative reforms. There might be a cessation of arbitrary measures, there might be a stop put on Court extravagance, and a reduction of the army. There might be Ministers commanding confidence, and allowed in concert with the CZAR to carry out beneficial measures. A better class of officials might by degrees be selected and promoted. The Budget might be subjected to the revision of a Council, the members of which offered some guarantee for independence. It is obvious that reforms of this modest kind could only be made by a Czar who honestly wished to carry them out, and who was honestly thought likely to carry them out by the people. The present CZAR has no such wish and commands no such confidence. His son might possibly do what he cannot do, and the CZAR might abdicate to give his son the chance. But the CZAR may easily convince himself that it is best to hold on. As he disapproves of all concessions of the kind, he may think that his duty to his country forbids that he should allow another to do what he would think it wrong to do. He may consider it inconsistent with his personal dignity to yield to fear what he has declined to yield to reason. Lastly, he may think, and it would be difficult to say that he was wrong in thinking, that the spectacle of a Czar giving up his throne through fear for his life would sooner or later be fatal to his dynasty. If one Czar could do this, the reverence for Czars generally would die away, and gradual reform might be impossible if the fatal secret was disclosed that the policy of a reigning monarch could be changed by an attempt to murder him. All things considered, it seems not improbable that the CZAR will try to go on as he has been going on, knowing that he may be killed, but thinking it better to die than to own himself terrorized, and that he will at any rate postpone his abdication, if he ever contemplates abdicating, until he has proved that his courage, however terribly tried, has not failed him.

ENGLISH PARTIES AND FOREIGN POLICY.

THERE are some indications of an increased disinclination to treat foreign and Indian affairs as subjects of party contests. More than one Liberal member has followed the example of Mr. COWEN in defending the general policy of the Government. Even if they are mistaken, they have the merit of understanding that questions of diplomacy and war have but an accidental connexion with differences of political opinion. Lord EDMOND FITZMAURICE, in an able and discriminating speech at Calne, lately discussed the policy of the Government in a critical spirit, without indulging in empty invectives either against the Government or against foreign Powers which may offend the political or ecclesiastical prejudices of some of the leaders of his party. The late conversations on the Tripartite Treaty in both Houses retained some traces of the vicious form of controversy which happily tends, since the elections at Liverpool and Southwark, to become obsolete. Sir W. HARCOURT unnecessarily expressed a hope that the obligations of the treaty had become void, because, as he said, he wished for the abolition of every guarantee for the maintenance of the Turkish Empire. When Sir W. HARCOURT becomes a responsible Minister he will be less anxious to precipitate a crisis which may not improbably end in a general war. He will also remember that some millions of Mahomedans will require a Government, as they cannot be readily extruded bag and baggage into indefinite space. Even if a statesman thought it desirable that any existing Power should be destroyed, he need not embarrass the future action of his own Government by publicly expressing his opinion. Like Mr. GLADSTONE, Sir W. HARCOURT proclaims himself the enemy of Turkey and of Austria, though probably on different grounds. It may hereafter be for the public interest that even a Liberal Government should act in concert with the States which are now objects of capricious vituperation. Lord E. FITZMAURICE thinks that Mr. GLADSTONE dislikes Austria as the ally of Germany, and Germany on account of the FALK laws. It is equally probable that he may be under the influence of his early Italian sympathies.

It is not explained why Sir W. HARCOURT has become the enemy of States which have given him no provocation. He need be under no apprehension that Turkey will be saved from ruin by the Tripartite Treaty. Lord G. HAMILTON, with sufficient accuracy for the occasion and the audience, told a Conservative Association that the treaty was no longer binding. As none of the three parties to the agreement had called on the rest to execute its provisions during the Russian war, it was scarcely necessary to consider what would be the duty of England if Austria or France hereafter unseasonably demanded co-operation in defence of Turkey. The ATTORNEY-GENERAL rightly explained that an unrevoked treaty had not been formally revoked, though, according to his delicate distinction, the covenants had fallen more or less into the shade. The CHANCELLOR of the EXCHEQUER added that Lord GEORGE HAMILTON had been practically in the right, though he might be technically mistaken; and Lord BEACONSFIELD announced that, in the almost impossible contingency of a demand for the enforcement of the guarantee, he would carefully consider past, present, and future circumstances. More than one speaker justly remarked that a guarantee of the Turkish dominions as they existed in 1856 could scarcely be enforced by or against Powers which had consented to the curtailment of the SULTAN's territory in 1878. Nevertheless the treaty may perhaps not be formally abrogated: In 1846 Lord PALMERSTON asserted that M. GUIZOT's Spanish marriage was a violation of the Treaty of Utrecht, which had been made more than a hundred and thirty years before. It was doubtful whether any part of the treaty had been left untouched during the wars which had been waged and the treaties of peace which had been concluded with the House of BOURBON and with NAPOLEON; but Lord PALMERSTON's assumption that the treaty was still in force was not directly disputed by the French Government.

Though Lord EDMOND FITZMAURICE once more recurs to the Berlin Memorandum, public attention is directed, not to the history of the Turkish war, but to the military and political condition of affairs in Afghanistan. The scanty information which has been received from Cabul is, on the whole, not unsatisfactory. No further attempt has been made on the camp at Sherpur, which is probably now impregnable. The occupation of the capital through the winter which is now nearly at an end is thought to have raised the estimation in which English power is held by the Afghans. They are said to have deduced, with a rapidity not unknown to more civilized nations, from the solitary

precedent of the old Afghan war, the conclusion that an invading army must succumb to the severity of the climate. The immunity of the English force from attack and disaster is said to have encouraged demonstrations of friendship and confidence. The majority of the BARUCKZYE family now resides at Cabul, in friendly relations with Sir F. ROBERTS. The Indian Government would probably select one of the number as Ameer if there were sufficient grounds for believing that his title would be recognized. The only conspicuous absentees among the descendants of DOST MAHOMMED are AYOUB KHAN, who was lately supposed to meditate an expedition against Cabul, and ABDURRAHMAN, who, by his own ability and through his connexion with the Russian authorities in Turkestan, may possibly become a formidable pretender. Some years ago he obtained temporary advantages over his brother SHERE ALI, and he is believed to exercise considerable influence among the chiefs of Afghan Turkestan. The reports of his arrival in Balkh seem to be premature; but there is little doubt that he is engaged in warlike preparations. If ABDURRAHMAN establishes his authority among the Northern tribes, it may perhaps be expedient to negotiate with him for a recognition of his title to provinces which he may occupy. There seems to be little chance of maintaining the unity of the Afghan kingdom, and probably a scheme for its dismemberment is already in progress. In the meantime it will be necessary to renew military operations as soon as the weather allows of the commencement of the campaign. The subjugation of the Southern provinces is incomplete as long as a hostile army occupies Ghuznee. It is not known whether MOHAMMED JAN commands popular support, but he seems to be an active and capable leader; and he derives importance from the occupation of a considerable fortress. Sir DONALD STEWART will probably co-operate from Candahar with Sir F. ROBERTS, and probably Ghuznee will be taken in the early spring. It may be hoped that the COMMANDER-IN-CHIEF will not previously supersede General ROBERTS, though it is not unnatural that he should become impatient of obscurity and inaction.

The only additional light which has been thrown on the mysterious negotiation with Persia is derived from the real or affected indignation of the Russian journals on the rumour of the proposed arrangements. Some of the same writers had, with the supposed approval of their Government, repeatedly and urgently recommended the transfer of Herat to Persia as the consideration for a friendly understanding with England. The Moscow and St. Petersburg papers now unanimously denounce the alliance of England with Persia, and the acquisition of Herat by a State which has preferred a rival patron. It is even asserted, perhaps without authority, that the Russian Minister at Teheran has threatened to break off relations with the Government. Until the English Ministers are at liberty to become more communicative, it is impossible to judge how far the Russian protests are formidable or even serious. In the absence of full explanations, it is impossible to appreciate the reasons which may have suggested the negotiation. A sudden departure from the traditional policy of the Indian Government with respect to Herat ought to imply a cogent motive. It is possible that the proposed measure may have some relation to the vast preparations for the campaign against the Turcomans. General SKOBELEFF, who has been appointed to the command of the expedition, is young, able, and ambitious; and, according to reports which are probably exaggerated, he recommends that the army should consist of a hundred thousand men. A much smaller force would be sufficient to retrieve the failure of last year; and a great army, necessarily marching by several parallel or converging routes, must have some important destination. The Turcomans on their side are making preparations for resistance; but all their able-bodied men would scarcely equal the Russian army in numbers, and they would be far inferior in arms, in discipline, and in general efficiency. The daring and active general whom they will encounter is probably better qualified for the special service than a profound and scientific strategist. Whatever may be the reasons of the English Government for their project of giving Herat to Persia, it might have been thought that Russia would regard the transfer with complacency. No treaty with England can make Persia permanently inaccessible to Russian influence. The possession of Herat by Persia would furnish an additional reason for diplomatic pressure, which might in case of need be enforced by threats. Probably Persia may have required a guarantee which the English Government was not prepared to give in an unqualified form. If unforeseen difficulties render the scheme abortive, the negotiation may perhaps not have been altogether harmless.

THE IRISH DEBATES.

THE Irish members who, with the aid of Mr. RYLANDS, delayed the passing of the Irish Relief Bill, apparently entertained but little objection to its provisions. Few even of their own number desired either that outdoor relief should be given in the shape of money, or that small farmers should be paid for cultivating their own land. The doubt whether Presentment Sessions ought to be allowed to institute public works had been expressed by Lord EMLY and other peers in a short and pertinent conversation in the House of Lords. The proposal is not free from objection; but in questions of this kind Parliament is wisely disposed to allow a wide discretion to the Government. The miscarriage of a similar experiment in the great Irish famine furnishes a useful warning against a large and reckless expenditure, which has the incidental effect of diverting labour from agriculture. On the whole, the Government has probably been well advised in refusing to allow the Boards of Guardians to institute public works. The Irish poor are not reduced like the Lancashire operatives in the cotton famine to compulsory idleness. There is more doubt about the expediency of giving powers to the Presentment Sessions than as to rejecting an extension of the system. The debate on the clauses of the Relief Bill sufficiently proved the injustice and insincerity of the charge that the Government had been guilty of gross neglect. No alternative measures were seriously proposed; and the more violent speakers virtually admitted the weakness of their own case by their personal attacks on the principal members of the Irish Government. One of them objected to entrust the administration of relief to the LORD-LIEUTENANT because he had refused an invitation to dine with the Lord Mayor of DUBLIN. Other speakers professed to believe that the main object of the Bill was to secure to the landlords the rights of property which have lately been denounced by demagogues as the main cause of Irish distress. Even the followers of Mr. PARNELL cannot be really indifferent to the urgent need of their countrymen. When they object to the only practical methods of relief they may be supposed to rely on the majority which, as they know, will overrule frivolous objections. Their protests will remain on record as excuses for withholding any gratitude which might be considered due to the Government or to Parliament. The famine will be averted; but, as one of their English allies asserted in the debate on the Address, no thanks will be given to the Government.

There was a great preponderance of argument in favour of the application of a portion of the Irish Church Fund to the purposes of the Bill. The loans to landlords are to be repaid in a certain number of years by instalments; but the advance of money at the almost nominal interest of one per cent. of course involves a loss for which some provision must be made. The residue of the Church Fund, which has already furnished the means of one legislative experiment, is not unreasonably charged with the deficiency. Advances to Boards of Guardians at the ordinary rate of interest will be made from the Treasury, which will by the usual precautions secure itself against loss. The actual relations of the fund to the Commissioners of Public Works, and the intended conversion into Terminable Annuities, have no bearing on the principle of the Government measure. As Mr. CHILDERS said, the demand arising from present emergency corresponds much more nearly to the provisions of the Church Disestablishment Act than the application of another portion of the fund to purposes of education. It may be added that it is not inexpedient to diminish the anomaly of a large amount of property held by the State on trust for no definite object. Mr. SYNAN announced that he and his friends were determined to reserve the Irish Church Fund for the compensation of landlords who are hereafter to be expropriated; but Parliament, which has not yet resolved arbitrarily to transform occupiers into owners, is still less disposed to relieve them from the necessity of paying for the property if they acquire it. The most

plausible reason for relieving Irish distress at the cost of the Imperial Treasury is that the sacrifice must have been incurred if there had been no other fund within reach. Large advances made during the famine of 1847 eventually became a gift, though Irish patriots have ever since complained of the parsimonious cruelty of the English Government. If necessary, the precedent must have been followed, as it has been found that landowners cannot afford to borrow at the ordinary rate of interest. As there happens to be an Irish fund which may be legitimately applied to the prevention of famine, the necessity which would justify a demand on the taxpayers of the United Kingdom has not arisen.

The CHANCELLOR of the EXCHEQUER was probably but little surprised at Mr. MELDON'S determination to interpose a debate on the Irish Borough Franchise in the midst of the discussion on the Relief Bill. On this question the followers of Mr. SHAW and Mr. PARNELL command the support of nearly the whole body of the Opposition; and few Irish members are disposed actively to resist a measure which is in a certain sense plausible, though its practical effects might probably be noxious. The mischief which is to be set off against the advantage of abolishing an Irish grievance would be limited in extent. A dozen or a score of respectable members would be replaced by congenial allies of Mr. O'CONNOR POWER and Mr. O'DONNELL. In many boroughs the present representation can by no possible contrivance be deteriorated. Nearly every argument which Mr. C. LEWIS used against the proposed extension of the suffrage was sound; but there is no use in delivering an irritating speech, even though all the statements which it contains may be true. It was perhaps worth while to quote from Mr. SULLIVAN'S paper the coarse doggerel in which Irish patriotism expresses its preference for the Zulus over English and Irish soldiers. The national Irish papers have long been a disgrace to journalism; and their malignity illustrates the spirit of the dominant section of the Home Rule party. It is inexpedient to dilate on the demerits of the rabble which under a system of household suffrage would control every Irish borough. No class of the community ought to be attacked in Parliament, even by those who doubt its fitness to exercise political power. It is also imprudent to rely on the absence of agitation among those who are at present disfranchised. When Mr. LOWE used a similar argument against the Reform Bill of 1866, Mr. BRIGHT appealed with conclusive effect to the London mob; and the consequent destruction of the Hyde Park railings was understood to prove that the unenfranchised multitude was in earnest. Nothing would be easier than for Irish demagogues to promote disturbances in support of the demand for household suffrage. At present they probably prefer the hardship of refusal to any political advantage which might result from concession.

Sir WILLIAM HARCOURT and Mr. BRIGHT naturally welcomed the opportunity of expressing their sympathy for the Irish democratic party without pledging themselves to Home Rule. It is a commonplace of Liberalism that devotion to the unity of the kingdom is best shown by extending uniform and equal rights to all its parts. Sir W. HARCOURT even declared, with some rhetorical exaggeration, that, if he was not prepared to give Ireland the benefit of English institutions, he would be an advocate of separation. It is not necessary to construe too literally phrases which require much limitation. The disruption of the kingdom would not become less objectionable if there were conclusive reasons against the equalization of the franchise. It is, in fact, neither possible nor customary to legislate for Ireland without reference to local peculiarities. When there is a question of relieving distress, or of modifying the rights of property and the tenure of land, Irish agitators are not careful to abide strictly by English or Scotch precedents. Mr. LOWTHER, who, against the opinion of his own party, has consistently disapproved of special legislation for Ireland, replied with some point, to a charge of enmity to freedom, that he had always been the champion of freedom of contract. To arguments founded on the poverty and ignorance of the small ratepayers in Irish boroughs Mr. BRIGHT answered, with much force, that exactly the same grounds had been urged for the maintenance of a restricted franchise in Great Britain. It was not because they were likely to return good members, but because they were numerous and powerful, that the present constituencies were created. The Irish householders who are now excluded from the franchise probably bear to the present voters nearly the same relation which the new sections of English constituencies bore to the 10*l.* householders. A privileged class of 4*l.* ratepayers is but a questionable aristocracy.

The Government defeated Mr. MELDON by the normal majority of between fifty and sixty which has maintained itself into the seventh Session of Parliament with little loss. It would scarcely be possible to accept from a private member at the present time a proposal to alter the representative system. Nothing was said by the CHIEF SECRETARY or by the ATTORNEY-GENERAL for Ireland which would preclude the Ministers at some future time from extending the English franchise to Ireland. The present arrangement was made, as some of the speakers in the debate observed, when Parliament at the end of the Session of 1867 was weary of the whole subject of Reform. Mr. CHICHESTER FORTESCUE, by a compromise with the Opposition, and in the absence of remonstrance on the part of the Irish members, inserted the 4*l.* franchise in the Irish Reform Bill. Since that time many attempts have been made to alter the borough qualification; and the Government has, as on the present occasion, rejected the proposal as unnecessary or inopportune, rather than because it was not intrinsically reasonable. It is necessary that political arguments should recommend themselves to the popular understanding; and prudent statesmen will not unnecessarily call attention to the unsatisfactory condition of the poorest classes in Irish towns. Dwellers in mud-huts are perhaps not likely to possess high political intelligence, but they will resent the denial of their capacity and independence. There might be some advantage in increasing the number of voters, which is now in most of the Irish boroughs absurdly small. Some of the speakers of the majority contended that redistribution would be a necessary consequence of reduction of the franchise; but, if the process would be inexpedient, Parliament is not compelled to undertake the task. After a fortnight devoted exclusively to Irish debates, the House of Commons must feel anxious to proceed with its general business.

LORD EDMOND FITZMAURICE AT CALNE.

LORD EDMOND FITZMAURICE is not only a moderate Liberal, but a moderate Liberal in a remarkably comfortable position. He is the brother of the Marquess of LANSDOWNE, and sits for Calne. His title to go into Parliament is unquestioned. He has not to fear a Conservative opponent, or the counter claim of a Gladstonian Liberal. He has been addressing his constituents this week, and his address was rewarded with what is recorded as the usual vote of confidence. Happiest of moderate Liberals, he knows that those whom he addresses will feel all their habitual confidence in him whatever he may say. If he wishes to defend the Government, he can defend it without apprehension of any personal consequences. No one would dream of demanding that he should get a certificate from Lord HARTINGTON before he was accepted at Calne. If he makes out a case against the Government, he can make out his case after his own fashion, owning difficulties, censuring errors, but censuring errors gently; offering opinions, but offering them as merely expressions of what he thinks would have been the best course to have taken under circumstances where there were many objections to any course that could be proposed. He traversed the wide field of the foreign policy of the Government, and had the delight, so rarely given to the moderate Liberal, of being able to discuss point by point in a spirit of moderation. He could afford himself the pleasure of denouncing what he called the tub-thumping style of dealing with foreign policy as securely as if he had been a peer or a journalist. He can survey the Midlothian campaign from the calm heights of a person who possesses a perfectly safe seat. And he can permit himself to denounce tub-thumping on a ground which few Liberals venture to take, being silenced by the fear that they will be thought guilty of personal disrespect to admired leaders. He dislikes tub-thumping because it is not statesmanlike. It is based on ignorance, or at least on insufficient knowledge. If Mr. GLADSTONE, he pathetically exclaimed, did but know a little about Austria before he spoke about it! To be

recognized as an undoubted Liberal, to know that to be re-elected will scarcely cost him as much trouble as to order a new coat, and to be able to smile publicly and with an air of cheerful good humour at the ignorance of Mr. GLADSTONE, form a combination of advantages allotted to very few; and Lord EDMOND, if he is of a pious and grateful disposition, may nightly thank the Providence which has made him in this semi-Liberal land the happy English child of a family that invariably commands the usual confidence of Calne.

It is the general attitude of the speaker towards friends and foes that attracts us. He is aware that the Eastern question is a very old question, a very difficult and complicated question, a question which events rather than opinions must ultimately solve. This old and difficult question touches more or less nearly some of the permanent interests of England. To defend these interests, England must in the last resort be prepared to fight. There is not a single Minister who has held the seals of the Foreign Office since the question was first started by the partition of Poland who has not been willing to go thus far. Within these limits the foreign policy of the present Government has been merely the policy of any possible Government. Directly this is realized, criticism becomes what it ought to be in such a case—criticism of the expediency of this or that step taken by the Government. Lord EDMOND was free and unsparing in criticism of this kind, and he was quite justified in being free. A member of Parliament who wishes to be worthy of his position must try to form an opinion, based on reflection and information, as to what, under given circumstances, is best to be done; and if his opinion is not that on which the Government has acted, he does a public service when he states clearly its differences from the Government's opinion, and explains what he thinks, and why vague denunciations of the Government are as valueless as vague praise of the Government. The only criticism that is instructive is that which begins by treating every part of the Eastern question as one of relative expediency, offers definite suggestions, defends them, and then compares what the Government has done, or is doing, with these suggestions. The essence of this criticism is that the critic should impartially state when in his opinion the Government has been right as well as when it has been wrong. Lord EDMOND's criticism is of this fair and temperate sort; and as no Conservatives criticize the Government, and few Liberals criticize it fairly, it is refreshing to listen to the fair criticism of a Liberal whom circumstances enable to say just what he thinks. With some parts of the criticism recorded at Calne we find it easy to agree, with part we find it impossible to agree. In some points the balance of expediency seems so even that, as the Government was obliged to do something, we may be content to accept what was done. It cannot be too steadily kept in mind that questions so obscure and complicated as the Eastern question can only be rightly judged by the possessors of adequate information; and that, while critics can only gain information from books, journals, and travellers, who usually travel to prove the theory with which they start, the Government has the very important addition to its information which diplomatic correspondence supplies. The presumption in cases where critics have not sufficient information to enable them to pronounce a decisive judgment, is that the Government of the day, however it may be composed, has acted as it has acted because it knows more than the critics know. Criticism that does not recognize this is not fair criticism, and, although Lord EDMOND FITZMAURICE never openly offended against a canon which we may be sure he would accept, it is difficult not to suspect that in some instances he would have modified his opinion if he had been behind the scenes, and had known all the Foreign Office could have told him.

To criticize fairly Lord EDMOND's fair criticism would necessitate a very long and minute discussion of many complicated questions. But it is interesting to observe the general results to which fair criticism has led a very promising politician, who has given himself the trouble to think, not only of what was done, but of what ought to have been done. Lord EDMOND, in his pursuit of fairness and clearness, separates himself quite as much from the general body of Liberal critics as from that of Conservative critics. He is for an intimate alliance with Germany, and wishes to see Austria extend herself to Salonica. He dislikes what he calls the living despotism of Russia even more than the moribund despotism of Turkey. He objects to the acquisition of Cyprus, but he objects to it on a ground which the most fiery Conservatives might think deserving of consideration. A study of expediency has convinced him that at the end of the war we ought to have seized on some strong place in the dominions of Turkey; but he thinks we seized on the wrong place. We got something, but we did not get enough. He would himself have preferred Acre. It is unnecessary to ask how he has persuaded himself that we could have got Acre without a standing quarrel with France; for it is the general nature of his opinions, not their value, that we are noticing. A Liberal has got very far away from his tub-thumping leaders when he strives to show that the Government ought to have done something much bolder than what it did, and should have somehow got hold of the key of Syria and Egypt. As to Egypt itself, he seems to think we should exercise a predominating influence. Where he thinks that Lord SALISBURY was wrong was in not forcing the English Minister back on the KHEDIVE. This, he holds, would have been better than to have reverted to the system of control. This may be a doubtful case of expediency; but at any rate a person who holds this view can have no doubt as to the general expediency of interference. It would be difficult to interfere more directly in the affairs of Egypt, if Egypt is to be nominally independent, than to insist that its ruler must always have in his Cabinet an Englishman with a power of veto. As to the Afghan war, Lord EDMOND has no notion of denouncing it as a base, bloody, aggressive, unprovoked war. He merely thinks that events have shown that it would, on the whole, have paid better to adopt a temporizing policy. There is much to be said for such a view, and much to be said against it; but this is one of the instances in which we cannot be sure that the critic would hold to his opinion if he knew all that the Government knows. Even when Lord EDMOND most decisively differs from the Ministry, his views are not of the kind which candid supporters of the Ministry would give themselves much trouble to oppose. He thinks that Lord DERBY let things drift too much, and now that Lord DERBY is no longer one of their leaders, many Conservatives would gladly own that it would have been advantageous to England and Europe if, when the Berlin Memorandum was rejected, we had had a Foreign Minister who had formed and expressed some sort of definite opinion. Lord EDMOND further complained that, after the Treaty of Berlin, the Ministry, or at least some of the Ministers, gave expression to too sanguine expectations of reform in Turkey. There need be no hesitation in agreeing with this criticism, for the Ministers themselves have frankly owned their disappointment, and have changed not only their language but their action. The general result is that when a perfectly independent Liberal who hates tub-thumping sets himself to the labour of fair criticism, he finds that the general foreign policy of the Government is that which any Government must have adopted, that the Government has been often quite right, but has made some blunders, has decided some delicate and doubtful points with doubtful prudence, and in some instances has not strayed from the tub-thumping view as far as it ought to have strayed.

FRANCE.

THE enthusiasm with which M. DE FREYCINET's noble stand against the amnesty agitation was originally greeted has entirely died away. In order that a stand should be noble it must first be a stand, and it is this preliminary feature that is wanting to M. DE FREYCINET's attitude. To tell a naughty child that he shall have his pudding as soon as he has stopped crying is usually tantamount to giving him it at once. The shortest possible flash of silence is accepted as sufficient, and the pudding is eaten before it has had time to get cold. M. DE FREYCINET's announcement that if the advanced Left want a plenary amnesty they must prove themselves worthy of it is quite in this vein. The prescribed acts of virtue do not demand any serious sacrifices. All that the Government asks for is their votes, and there is no reason to suppose that the Cabinet contemplate the introduction of any measures which the Left may not support with a clear conscience. The interval during which the votes must be given and the amnesty withheld is sure not to be

a long one. When the Government has grown accustomed to seeing the advanced Left on its side, it will not like to face the gap which would be occasioned by their withdrawal. The votes which have been gained by a promise will have to be retained by its fulfilment. There are already indications that the excellent case which the partisans of an amnesty have in the circumstances under which the Commune was suppressed will not be neglected. A concession which only stands over until certain railways and canals have been constructed may reasonably be made a little sooner to stave off an inconvenient agitation. The only real plea for withholding an amnesty has been abandoned by M. DE FREYCINET. If the conduct of the Communists is not bad enough to forbid their return to France three years hence, it is not bad enough to forbid their return to France now. The country will be no better protected against their designs because so many more miles of railway have been opened.

The Government have just effected a reform in military administration which will greatly gratify their Radical supporters. In M. WADDINGTON'S time it was considered that the army could not get on without three Inspectors-General, and one of the fortunate Commanders for whom these posts were created was the Duke of AUMALE. Whether the army was in any way the better for these appointments there is nothing to show, but there was an obvious—or what might have been thought an obvious advantage in having one of them held by the most conspicuous member of the Orleans family. Nothing gives to a Republic the appearance of stability so much as the readiness of members of the dethroned family to take service under it. It is a standing admission of the continuity of the *de facto* Government. The Duke of AUMALE wishes to do active duty as a French citizen, and the way of which he makes choice is to apply to the Republic for orders. Unfortunately this is not a kind of reasoning which recommends itself to a French Radical. Continuity with anything that has gone before is the last thing that he desires to maintain. If Royalists find that they can live contentedly under the Republic, that is a sufficient indication that all is not as it should be with the Government. A Royalist has no business to feel contented when his enemies are in power; if they are doing their duty by him, he ought to have very good reason for being discontented. The fact that one of the highest posts in the army is held by the Duke of AUMALE has been a continual grief to politicians of this way of thinking. Of course they have had their compensations—notably when the DUKE'S official letters were addressed to him as "General D'AUMALE." But the thrill of pleasure derived from omitting the title of a Royal prince soon passes away, while the annoyance that he should be there to be addressed continues. Now this is at an end. The Duke of AUMALE retires into the obscurity of a General unattached. The only advantage that the Radicals can derive from this change is the increased alienation of the Orleanist party—the one section of the Conservatives that is not avowedly and permanently hostile to Republican institutions. That M. DE FREYCINET is wise in his generation is highly probable He wishes, above all things, to construct a Ministerial majority — a majority pledged not merely to the maintenance of the Republic, but to the support of the particular Republican Cabinet which is now in office. The virtual dismissal of the Duke of AUMALE will go far to conciliate the extreme Left. M. DE FREYCINET might have rendered many solid services to the State and not have secured the popularity which he will earn by this simple act. Any ill consequences that may flow from it will be some time in maturing, and long before they have come to perfection M. DE FREYCINET will be no longer in need of a majority. The incident is the merest straw in itself, and it may easily be that the Government have really ascertained that the Inspectors-General were not of sufficient use to the Minister of War to make them worth the money they cost. What is really to be noted is the reception which their suppression will meet with at the hands of the Radicals, and the evidence this gives that the Left are as far as ever from appreciating the value of conciliation as a political engine.

M. FERRY'S Education Bill, which has so long been hanging between earth and heaven, is at last coming on for discussion in the Senate. The debate begins next Tuesday, and, with the exception of M. GAMBETTA, whatever there is of eloquence in France will be arrayed on the side either of the attack or the defence. The 7th Clause, as has often been pointed out, has come to bear an importance to which as a matter of fact it is scarcely entitled. Its fate in the Senate divides with M. SARDOU'S new play the attention of Paris society. The positive results which will follow its adoption may not be very considerable, for the Church will in the end find means of substituting teachers not belonging to the prescribed orders, who will do her work equally well. What justifies to some extent the singling out of this clause from many other similar attacks upon liberty of education is the directness with which it assails parental rights. At present every Frenchman can choose his children's teachers. He may have to subject his children to some disadvantages if he chooses those teachers at the bidding of the Church, but, though he may have to pay for his liberty, he is not deprived of it. If the 7th Clause becomes law, this liberty will exist no longer. A class of teachers who have of late years been growing in popularity among French parents will in future be banished from every school. However the application of the law may be suspended or evaded, there can be no question as to the nature of the temper which it is designed to please. The French Radicals hate the Church so cordially that in order to gratify their hatred they are willing to sacrifice the liberty of parents to bring up their children after their own pleasure. No doubt parents will still be free to send their children to schools taught by Catholics, and so far their control over their own children is left unimpaired. But all that this amounts to is that the 7th Clause is more tyrannical in intention than it is in execution. It arbitrarily denies to parents the class of teachers they like best, while allowing them for the present to employ the teacher they like next best. A compromise of this sort has the merit of neither extreme. The man who carries out a bad policy thoroughly and consistently may at least claim intellectual respect. The man who carries out a bad policy weakly and inefficiently fails to gain any respect whatever. It is hard to say whether the 7th Clause is most remarkable for the injury which it purports to inflict on liberty or for the incompleteness of the machinery by which it proposes to inflict it.

THE SOUTHWARK ELECTION.

THE result of the Southwark election, though the return of Mr. CLARKE was not unexpected, is a severe disappointment to the Liberal party. There is reason to believe that the reaction which it discloses is directed rather against the extreme section of the party than against the moderate Liberals. The Irish electors of Southwark, though they seem to have had no separate organization, probably supported Mr. DUNN, or perhaps in some instances Mr. SHIPTON. The Liberal candidate was not even asked to give the pledge which was taken by Lord RAMSAY at Liverpool with results disastrous to his party. The imprudent concession, and the partial sanction which has since been given by the leaders of the party to the policy of tampering with Home Rule, may probably have affected the fortunes of the candidates in Southwark. Among secondary issues, the most important was that of compulsory abstinence as it is promoted by Sir WILFRID LAWSON. The publicans were unanimous on the side of Mr. CLARKE, while the members of temperance societies preferred Mr. DUNN. Mr. SHIPTON, whose pretensions cannot be regarded as serious, was equally unacceptable to both parties in the liquor controversy. It was asserted, perhaps with some exaggeration, that the Radical Club which was represented by Mr. SHIPTON was founded on the great principle, once maintained in a slightly different form by JACK CADE, of beer at a penny a glass. The measure would evidently neither be conducive to temperance nor remunerative to dealers in beer. It is not necessary to discuss the merits of the Permissive Bill, or of its equivalent which has lately been known as local option; but it is certain that, in adhering to Sir WILFRID LAWSON'S proposal, Mr. GLADSTONE and Mr. FORSTER have not consulted the interests of their party. Though the publicans are in every borough a numerous body, Liberal candidates might perhaps afford to dispense with their votes, especially as they are outnumbered by the members of the different temperance organizations. Election managers too often forget that sellers of a commodity have necessarily customers, who are as much averse to the restriction of their liberty as dealers to the suppression of their trade. Sober and respectable consumers

of beer are probably more numerous than the drunkards and the ascetics for whose benefit or fancy they are expected to undergo a not inconsiderable hardship. It is to be regretted that beer-sellers and beer-drinkers should be driven to ally themselves with a political party; but the fault rests with the agitators, and the loss will fall on their involuntary allies. For two or three years after the last election Liberal members took every opportunity of repudiating hostility to beer. Those who direct their councils have lately seemed to forget a lesson which produced a strong impression at the time.

As far as the contest was strictly political it turned wholly on foreign and Indian affairs. Mr. Clarke lost no opportunity of reminding the constituency that he supported the policy of the Government in Eastern Europe and in Asia. Neither he nor the supporters of Mr. Dunn laid any considerable stress on domestic legislation. Those who have studied current history, with the result of forming judgments of their own, will not attach undue weight to the opinion of a popular constituency; but votes, if they must be weighed for the purpose of estimating their soundness, can only be counted as principal elements of political power. There have been within the last fortnight three contested elections. In the small borough of Barnstaple, which is remote from the changing influences of political opinion, the Opposition maintained and increased their majority. In Liverpool the Government gained a conspicuous victory; but their triumph in Southwark, where there has never before been a Conservative majority of the whole number that voted, is much more remarkable. It is said that since the Reform Bill no Metropolitan borough has returned a Conservative in a contest for a single seat. The successful candidates of the party for London boroughs in 1874 almost everywhere profited by a division among the Liberals. In Southwark Mr. Clarke has defeated the collective forces of his opponents. It may reasonably be expected that some of the other Metropolitan boroughs will follow the example which has been set. It is at least a great advantage that Liberal candidates will disavow all sympathy with the Home Rule agitation. Some of the most eminent amongst them have not waited for the warning which has been given at Liverpool. Mr. Fawcett long since told the electors of Hackney that he would not in any circumstances countenance an inquiry into a project for the separation of Ireland from the United Kingdom. Before the Liverpool election Sir Arthur Hobhouse and Mr. John Morley made similar statements to the constituency of Westminster.

Perhaps the most satisfactory result of the election is the additional discredit which is thrown on the electoral machinery imported from Birmingham. Mr. Gladstone went out of his way to recommend to the Liberals of Southwark the American system by which he hopes to establish the uncontrolled supremacy of numerical majorities. In deference to his advice, an Executive Council of Two Hundred was elected by those who chose to take part in the process; and the delegates afterwards selected Mr. Dunn and Mr. Thorold Rogers, after the withdrawal of overtures from candidates who declined to submit to a kind of competitive examination. Mr. Dunn, who has the pardonable and not unpopular defect of taciturnity, may perhaps have been a strong candidate. Mr. Thorold Rogers, who has achieved but limited notoriety by the habitual use of strong language, illustrated his own qualifications for political life by a speech in which he denounced the Government of Austria as a fouler despotism than that of Turkey. He had forgotten that his political leaders, probably with his own concurrence, are pledged to the proposition that the Turks as compared with the worst of Europeans are unspeakable barbarians. At the general election he will have the opportunity of learning whether the constituency is as easily attracted by noise and violence as the Liberal Two Hundred. It is highly probable that some of the votes against Mr. Dunn were directed against the delegates. Mr. Chamberlain and Mr. Gladstone forget that the members of their governing bodies are known to all their fellow-townsmen, and that some of them may be better known than liked. All reasonable persons acquiesce in the exercise of lawful authority, even when they distrust those in whose hands it is placed. Mr. Chamberlain's Corporation rules Birmingham with undisputed sway; but his Two Hundreds and Three Hundreds claim an extra-legal power which provokes resistance where it fails to command sympathy. A fussy Liberal Association at Finsbury, which proposes to displace Mr. Torrens in favour of Lord Ramsay, will do well to profit by the example of Southwark.

The most obvious of all the political morals to be deduced from the late election is that the more vehement Liberal orators have committed a mistake in tactics. Perhaps it may have been for their interest to heap invective and insult on the Government; but they have shot their bolt too soon. Throughout the autumn and winter itinerant agitators have appealed to the multitude against the decision of Parliament in language studiously adapted to the supposed taste of the audience. The professed object of Mr. Gladstone and his followers has not been to establish or confirm theoretical opinions, but to drive from office the most wicked and most incapable Government which, according to their doctrine, has ever mismanaged public affairs. They have often announced with prophetic exultation that the change which they endeavoured to produce was already complete. Mr. Gladstone's furious and frivolous complaints of the prolongation of Parliament into a seventh Session were evidently inspired by the belief that an immediate dissolution would ensure the defeat of the Ministers. Loud and unqualified vituperation serves the same purpose in political controversy as a general charge in the crisis of a battle. If either attack fails, it is difficult to repeat the experiment. It now appears that the artisans and small tradesmen of Southwark, who probably represent the feelings of hundreds of thousands of their equals, care nothing for Mr. Gladstone's denunciations or for the alleged crimes of the Ministers. They probably believe in an indefinite manner that the Government has done its best to maintain the honour and influence of England, and they suspect the Opposition of subservience to an anti-national faction. It is of course possible that the result of the Southwark contest may be due to local or accidental causes; but as long as it is doubtful whether it may not indicate the tendency of public opinion, it will probably have the effect of checking the torrent of hostile declamation. Of late the enemies of the Government have generally included in their censure a House of Commons which, as they contend, no longer represents the people. If the Southwark precedent is followed, they will be driven to assert that the constituencies are as corrupt as the Cabinet and as Parliament. It will be more prudent to abandon polemical practices which have thus far not succeeded. It is useless to caution the extreme section of the party against an ostentatious alliance with the obstructive faction.

THE POPE'S ENCYCLICAL.

There are few greater fallacies than the notion so frequently met with that the difference between the Christian and the Secularist view of life is one that does not extend to morality. It is fair to say that this mistake has always been confined to England. On the Continent the Liberal party—using that term in its current Continental sense, as equivalent to the anti-Catholic party—are perfectly aware of the lengths to which the difference between them and their opponents extends. There are no subjects more hotly discussed in France or Belgium than marriage and divorce, none on which the opinions of those who take part in the controversy are more completely opposed, and none which are more intimately associated with morality in its most concrete and popular sense. In France a Divorce Bill is now before the Chambers; and if, as is far from improbable, it should become law, a new and fertile element of confusion will be introduced into French society. Hitherto the law of the State and the Church on the subject has been the same, and though there are many recognized marriages which the Church does not accept as ecclesiastically valid, there are none which she does not accept as valid in so far as the matrimonial contract is concerned. If the re-marriage of divorced persons is permitted by French law, there will be a certain number, perhaps a large number, of unions which the civil law will regard as in all respects valid marriages, while the Church will regard them as not even civil marriages. This is the state of things, of course, even in England with Roman Catholics. But in England Roman Catholics are only a small minority of the population, and their divergence from their countrymen on the question of divorce excites no attention. It will be very different in countries where the

majority of the population are still nominally Catholics. A Catholic is not troubled by the spectacle of a couple living together as man and wife after the performance of only the civil rite. If they are not themselves Catholics, it is the nearest approach to the sacrament of matrimony which they are capable of making. But, in the judgment of the Church, the contract of marriage equally with the sacrament of matrimony is indissoluble; and if a prefect, for example, has put away his wife and married another, he will be living in what his bishop will regard as simple concubinage. The relations between the civil and ecclesiastical authorities under these circumstances may be more edifying to devout Catholics than agreeable to those who wish to make the best of both worlds.

It is not probable that the Encyclical which LEO XIII. has just devoted to this vexed question will tend to make matters smoother. Nothing, for example, will more recommend a measure to the majority in the French Chambers than the knowledge that the POPE has denounced it beforehand. It is exceedingly natural that, as more and more Frenchmen break away from Catholic beliefs, they should demand the same liberty in the matter of divorce which is enjoyed in Protestant countries. Even the POPE can scarcely expect men who do not hold marriage to have any religious sanction whatever to assign to it that absolute indissolubility which has in practice never been attributed to it except by those who have raised it to the dignity of a sacrament. The Encyclical aims, indeed, at proving that, even if the question be decided on merely social considerations, divorce ought to be forbidden. The POPE has no difficulty, of course, in showing that divorce is attended by many evils. Englishmen will remember how strenuously this aspect of the question was urged in Parliament when the present Divorce Act was under consideration. But whenever the question is argued on purely social grounds, the theoretical advantages of maintaining marriage to be indissoluble fade before the practical convenience of allowing it in certain cases to be dissolved. In the case of other civil contracts the law favours their abolition when the ends for which they were entered into are no longer attainable, and a man whose wife has proved unfaithful, or a woman whose husband has deserted her, will naturally be hard to convince that the tie which no longer exists to any good purpose should be maintained simply as a disability to the innocent party. They will rather plead that the advantages which the Encyclical treats as inseparable from the doctrine that marriage is indissoluble are equally secured when marriage is held to be indissoluble except for certain grave causes. Undoubtedly the POPE is able to interpose at this point with examples of countries in which divorce, instead of being only granted for grave cause, is practically granted for any or no cause. But no one was ever yet prevented from taking that to which he thinks himself entitled by the warning that, if he did, some one else might take that to which he is not entitled. Divorce cannot permanently be forbidden in a community a large part of whose members are of opinion that it is unreasonable to forbid it. When the POPE traces all the evils of modern times to this pernicious source, he lays himself open to two answers. It may be replied that it is the abuse, not the proper use, of divorce that ministers to these evils, and that they exist in countries where divorce is not permitted. No doubt when divorce comes to be allowed for incompatibility of temper, the POPE's description of the consequences is quite accurate. "Conjugal bonds lose all stability, mutual "affection is impaired," and the wife "runs the risk of "being abandoned after serving man's passion." But the POPE himself does not say that these evil consequences follow from restricted divorce; his contention is that divorce is certain not to remain restricted. Once allowed, he says, "there will remain in future no barriers strong "enough to keep it within the fixed limits originally "assigned to it. . . . The unbridled desire for divorce, "daily becoming more general, must invade a greater "number of minds, like a contagious malady or a river "bursting its embankments." The persons to whom this prediction is addressed will certainly reply that, if the sensible part of the community remain persuaded that morality is desirable, and that unlimited divorce is destructive of morality, they will find some means of limiting it; while, supposing them to be unconvinced as to the value of morality, they will not keep alive an inconvenient restriction in order to secure a doubtful advantage. If their observations have extended to England, they will further say that there divorce has been both allowed and limited for some considerable time, and that at present there are no signs of the liberty being either withdrawn or extended.

The real strength of the Papal case lies in the undoubted inconvenience in Catholic countries of a conflict between civil and ecclesiastical morality upon so conspicuous a theatre as the marriage relation. From this point of view most reasonable people will agree that the argument against allowing divorce in such countries is very strong. But the strength of it will not come home to the combatant whom it is most important to convince. The Continental Liberal sees no inconvenience in a conflict with the Church. On the contrary, he burns to engage in it. His object is to intensify the opposition between civil and ecclesiastical ideas of morality, not to throw a veil over it. The pleasure of getting rid of one wife and marrying another would be rendered far more acute by the consciousness that the woman to whom he was civilly married could never obtain an ecclesiastical marriage even if she could succeed in persuading him to submit to it. Remarriage after divorce makes a greater breach with the Church than anything else—except perhaps marrying a nun—and divorce, as giving the means of effecting this breach, is desired with proportionate ardour. That under these circumstances it can long be withheld seems an impossibility. The Church must either regain her hold over countries like France or Italy, or she must consent to go her own way, and to recognize the fact that European society has to be won back to the fold, not retained in it.

ONE-SIDED FREE-TRADE.

THE Protectionists in the House of Commons make up in confidence for what they lack in persuasiveness. Though they cannot convince others, they are thoroughly convinced themselves. Mr. WHEELHOUSE's speech against one-sided Free-trade might have been delivered by a Hebrew prophet on the eve of the Captivity. Everything to his mind is going wrong, and in a very short time those who now scoff at him will be expiating in misery and ruin their disregard of his well-meant warnings. No doubt there is an element of truth in these lamentations. The trade of the country does suffer from the array of hostile tariffs which meets it on all sides. It would be a great gain to the English manufacturer and the English workman if the goods they make found as ready an entry into foreign markets as into their own. So long as Mr. WHEELHOUSE and the five gentlemen whom he led into the lobby confine themselves to mourning over the hold that Protection has in Europe and America, they have no difficulty in making out their case. It is when they insist that Englishmen would be better off if we retaliated upon the protectionist foreigner, and made the import of his goods into England as difficult as he takes care to make the export of English goods abroad, that their reasoning becomes so obscure. The fact that an enormous amount of foreign goods comes to England is the best possible proof that an enormous amount of foreign goods is wanted in England. They are there, as Mr. BOURKE put it, because people are willing to buy them, and have made money enough to pay for them. If a compensating tariff were imposed, the English consumer would be charged so much more for what he wants. Mr. WHEELHOUSE answers that he would have so much more with which to pay what he is charged. A great part of our imports consists of manufactured articles. If there were no hostile tariffs, the English workman would be able to find a market for his goods abroad, and so would be repaid for the injury done him by competition in his own market. If there were equivalent tariffs at home, these foreign goods would be kept out of the English market, and so Englishmen would be forced to buy goods made in their own country. Unfortunately for Mr. WHEELHOUSE's argument, the exports have obstinately gone on departing from the way in which they should go. It is not enough for his purpose that the proportion of exports to imports should have grown smaller; the exports themselves should have grown smaller. Instead of this, they have grown enormously larger under the very system which Mr. WHEELHOUSE declares must speedily prove fatal to English trade. For the last effort of a dying man, 192,000,000*l.*—the value of the exports of the United King-

dom in 1877—is not so bad. Before Sir ROBERT PEEL took the tariff in hand, the value of our exports was 53,000,000*l.* —the difference between that and the later sum showing the pace at which the ruin, foretold by Mr. WHEELHOUSE, is approaching. It is true that in one instance quoted by Mr. WHEELHOUSE, the exports have declined. We sent fewer goods to the United States in 1878 than we sent in 1854. But this only shows what no one denies—the injurious effect of hostile tariffs on English trade. It does not prove that English trade would have been any better if a retaliatory tariff had been imposed on American goods.

Mr. WHEELHOUSE did not say upon what goods he wishes to impose his retaliatory tariff. It must be presumed, however, that he would leave raw materials to come in, as now, duty free. English cotton-spinners would certainly not be enabled to compete on better terms with the manufacturers of the United States if they had to give more for the cotton they spin. Nor would English workmen be any better off by reason of the improved wages secured them by a protective tax on American manufactures, if they had to pay proportionately more for their food by reason of a duty on American corn. Nor, in the interest of English trade, could it be any gain to tax even manufactured goods which are not usually made in the United Kingdom. There remain the manufactured goods which are made both in England and abroad, and on these Mr. WHEELHOUSE would, it must be supposed, place a duty nicely calculated to give the English producer the command of his own market. This is the outside advantage derivable from a protective tax, since the command of other markets would only be lessened by such an expedient. If we taxed French silks to benefit Spitalfields, or American cottons to benefit Lancashire, the result would probably be seen in an angry increase of duties on other articles by France and the United States. Whatever dawning inclination towards Free-trade may exist in either country would at once be suppressed, and Protectionists would be able to point to England as to a conclusive instance of a country in which Free-trade had been tried and found wanting. Before Mr. WHEELHOUSE can expect Parliament to adopt his views, he must be able to compare with some precision the probable gain from the closing of the English market against foreign goods, and the probable loss from the closing of the foreign market against English goods. It is hard to say what other countries might do if they were provoked into making their duties retaliatory as well as protective.

Philanthropic economists like Mr. WHEELHOUSE are apt to forget the existence of consumers. For them the world is made up of Englishmen who are prevented from getting rid of their goods by the competition of foreign manufacturers. That there are millions of people who make nothing and want to buy everything does not come home to them as a matter of any importance. M. THIERS advocated protective duties because he wished to see the tall chimneys smoke. He never thought at whose cost they would be made to smoke. A duty on foreign manufactures, imposed for the sole reason that without it those manufactures can be sold in the English market at a less price than similar goods made in England, is really a subsidy paid by the public to the particular trades benefited. If Mr. WHEELHOUSE is of opinion that the existence and prosperity of these trades are of sufficient importance to justify their maintenance at the national expense, it would be better to propose a direct grant for the purpose. The country would then know exactly what it was paying, and there would not be the same risk of irritating foreign countries into increasing their tariffs. Before, however, he gives notice of such a resolution, it will be well for him to consider how he will deal with an obvious objection to which all expedients in the nature of protection to native industry are open. If foreigners can undersell Englishmen in the English market, it must be for one of three reasons. Either the industry is one which is not suited to this country, or not so well suited as others; or there is not as much energy or honesty put into it as there is in other countries; or the foreign producer is content with smaller profits or lower wages than the English producer. In the first case the community is asked to subsidize an industry which in all probability had better be abandoned. It would be possible, no doubt, to grow sugar under glass; and if a sufficient duty were laid upon foreign sugars, it might be so grown at a profit. This is an exaggerated example of the operation of protection to native industry; but, in so far as native industry needs protection, it is a perfectly correct example. In the second case, the community would be doing for particular sets of manufacturers what these manufacturers, if they were commonly honest, would be able to do for themselves. It would be interesting, for instance, to know how much American calico is bought in England because it is cheaper than English, and how much because it wears better. In the third case, Protection is neither more nor less than a grant in aid of wages. Mr. WHEELHOUSE must admit that the ideas associated with his proposal are not, at the first blush, of an inviting kind.

MR. GLADSTONE AND THE *SATURDAY REVIEW*.

THE correspondence columns of the *Church Times* of last week contained the history of a crime, the criminal being, it was alleged, the *Saturday Review*. The Rev. CHARLES CROSTHWAITE, Canon and Vicar-General of Kildare, wrote to say that he had seen in "a "January number of the *Saturday Review* a notice of "Bishop WILBERFORCE'S 'Life,' with a statement to "the effect that Mr. GLADSTONE'S treatment of the Irish "Church would be affected by the question" of the descent from St. PATRICK. Thereupon, Canon CROSTHWAITE sent a pamphlet of his own on that subject to Mr. GLADSTONE "with the extract from the *Saturday Review* pinned to it." He had not himself seen the "Life," and "depended on "the authority of the *Saturday Review*." In due time he received the expected postcard from Mr. GLADSTONE. After some remarks about the pamphlet and its subject, the writer stated that he had been led by the paragraph sent to refer to the "Life." "There is," said Mr. GLADSTONE, "not a word to sustain the assertion made "about disendowment. If it be a sheer falsehood," he is "sorry to say that it is only one of many published in "the same journal from time to time." Thus it appears that, according to Mr. CROSTHWAITE, in our notice of the Life of Bishop WILBERFORCE we made a reference to Mr. GLADSTONE'S correspondence about the Irish succession. Not only this, but the reference, according to Mr. GLADSTONE, was a false and misleading one. Not only this, but this "sheer falsehood" (we do not pretend to understand Mr. GLADSTONE'S "if") is only "one of many published "in the same journal." We may as well at once complete the historical part of the matter, though the completion may be a little startling. No such statement ever appeared in our notice of Bishop WILBERFORCE'S Life, or, so far as we know, in the *Saturday Review* at all. No allusion even in the two notices which we gave of that work was made to the subject. For Canon CROSTHWAITE'S statement, as for Mr. GLADSTONE'S reply, there is, as regards the *Saturday Review*, no foundation, or suggestion of foundation. We are not experts in the curious dialect of political controversy which Mr. GLADSTONE and Mr. BRIGHT have recently revived. But, as a matter of guesswork, we should imagine that the charge itself might very well be described as a "sheer false-"hood."

Here, as far as we are directly or, so to say, personally concerned, the matter might cease. As the *Saturday Review* never made the statement in question, it cannot be considered responsible for its truth or falsehood. The facts of the case might also be held by most impartial judges to throw considerable doubt upon the wholesale charge of mendacity which Mr. GLADSTONE has been good enough to formulate. But this can hardly be considered as finishing the affair. When—to use THACKERAY'S example—a man has been told that at a given time he murdered a little boy and converted him into sausage meat, or when, as has happened before now, he is informed that he, being to the deponent's knowledge married already, has been seen to commit bigamous matrimony in the face of day at St. George's, Hanover Square, the victim not unnaturally fails to be contented with a mere contradiction, or even a complete disproof. He wants to know how the thing came about. By some searching we have discovered a probable, or at least possible, source of the mare's nest. In a notice of Bishop WILBERFORCE'S "Life" which appeared in the *Pall Mall Gazette* of December 29 the following sentences occur:—"In 1845 Mr. "GLADSTONE is anxious to know whether the Irish Church "or the Romish Church in Ireland has the Catholic suc-"cession from St. PATRICK, intimating that his own view

"of disendowment would entirely depend on the answer "to *that* question. With the public at large it would "probably go for nothing, but if he himself were as sure "that the Irish Church was the Catholic Church of Ireland "as that the English Church was the Catholic Church of "England, no charge of temporary inefficiency would "weigh with him." We cannot, of course, be certain that this is the passage which Mr. CROSTHWAITE saw, and even if it be, we are not concerned to take up the cudgels for our contemporary, which is quite able to defend itself. But it is exceedingly well worth while to notice the attitude which Mr. GLADSTONE assumes towards this charge. He says, as we have seen, that there is "not a word to "sustain the assertion made about disendowment." We have referred, as Mr. GLADSTONE says he has done, to the letters given in the "Life," and there can be no doubt that such an inference as that we have quoted may fairly be drawn from Mr. GLADSTONE'S own words. He tells the BISHOP, or Dean, as he then was, that "I wish I could "accept your comfort" about the status and descent of the Irish Church; that the "quivering of historical "positions on which important convictions have, in a "material degree, rested themselves is a process inciting "disagreeable sensations"; that he agrees that "the poli- "tical question of the continuance of the present settle- "ment of Church property in Ireland will not be decided "by a reference to his queries"; that he is dissatisfied as to the efficiency of the Church; and that he cannot "have "faith," as against this dissatisfaction, "in the ordinance "of GOD," unless he can "see the seal and signature, and "these how can I separate from ecclesiastical descent?" According to the ordinary meaning of words it would seem from this that Mr. GLADSTONE did consider the question of disendowment—*i.e.* continuance or discontinuance of the present settlement of ecclesiastical property—to be materially dependent in his own case, though not in that of politicians in general, on the proof of descent, which, if sufficient, would serve to make up for shortcomings in efficiency.

This part of the matter is chiefly worth notice because it illustrates the blind precipitation with which Mr. GLADSTONE swallows and repeats any accusation against those who have the good or bad fortune to differ with him politically. A stranger forwards him something which he thinks may be made into a charge against a journal which he regards as a foe. He does worse than accept it without investigation. He takes apparently no trouble at all to ascertain whether the statement quoted was really made by the authority to which it is attributed—for we suppose Mr. CROSTHWAITE must have mentioned the name of the journal from which he fancied he took the extract—and he takes somewhat less than no trouble to ascertain the amount of foundation that it may have in fact. As to its validity, he contents himself with an offhand denial; as to its authorship, he contents himself with informing his correspondent that the author frequently tells lies, and this is doubtless one of them. So engaging indeed is the freedom with which those ugly words are flung about, that Mr. GLADSTONE does not even take the trouble to designate precisely the enemy whom he assails. For aught we know, he may not have shared Canon CROSTHWAITE'S delusion as to the origin of the paragraph, though, taking the two letters as they are printed in context, the reader naturally infers the contrary. Certainly, if the identity of that paragraph be as we have conjectured, it would be singularly difficult for any man in the habit of reading newspapers to make a confusion even between the smallest scrap of the *Saturday Review* and the *Pall Mall Gazette*, the type, paper, and size of which are wholly and strikingly different. But probably Mr. GLADSTONE did not occupy himself with these peddling details. The impulse of the natural man is in such a case to deny at once; and the impulse of Mr. GLADSTONE in his present mood of mind is to deny with circumstance, and with, if possible, an insulting remark about the accuser. Both Mr. GLADSTONE and Mr. BRIGHT indeed at present remind the observer of nothing so much as of the worthy gentlemen who are sometimes to be seen at Social Science Congresses and such like gatherings, and whom, while speeches are being made on their particular crotchets, the amused neighbour may notice shaking their heads, thumping their sticks, and ejaculating, more or less *sotto voce*, "lies," "bosh," "humbug," "scoundrels," &c. A great deal of virtuous indignation has been recently expressed at the idea that the Opposition indulge in vituperation, in inaccuracy of statement, or in any other pastimes unsuitable to the mildest-mannered men that ever wished to turn their adversaries out of Downing Street. We commend this little incident to those who are thus virtuously indignant. A statement which is at least apparently well founded, and which certainly any man might make in perfect good faith, is made (no matter by whom) about Mr. GLADSTONE. In the first place he denies it, in the next he charges the supposed criminal roundly with continual and systematic mendacity. For ourselves we have certainly nothing to complain of. The facts of this case go to show that, as far as Mr. GLADSTONE'S accusations are concerned, the *Saturday Review* might be taken in at the Palace of Truth itself, without fearing the ugly blots of a censorship on the Russian model. "And for our foes may this their blessing be"—to make charges with the accuracy of Canon CROSTHWAITE, and receive them with the calm and judicial scrutiny of Mr. GLADSTONE.

A NEW VIEW OF ST. FRANCIS OF SALES.

FRANCIS OF SALES, like his earlier canonized namesake of Assisi, is one of those Saints whom the Roman Catholic and Protestant worlds have alike consented to honour as a typical representative of sweetness and light; his "sweetness" is indeed noted in the Collect for his festival in the Breviary. He has especially been held up by his panegyrists, and generally accepted, as a man who in one respect at least was before his age, who in the midst of the religious bitterness and intolerance of the Reformation era, while himself a fervent Catholic, refused to employ against Protestants any but spiritual weapons, and by the persuasiveness of his preaching and his character converted a whole province from heresy to the true Church. It will be therefore to many people rather surprising to see a pamphlet entitled *The Persecution of Protestants by St. François de Sales*, the more so when the writer begins by reminding them that he is himself a Catholic and a convert, and prefixes to his *brochure* a "Note for Catholic Readers," which is in many ways so significant that we reprint it here as it stands:

> When first I came across the apparently treacherous and persecuting acts of the Saint, I was perplexed because he had been canonized. I have since learned from able and learned Catholics that a canonized Saint may be in Hell, or may not have any existence. Also that a Pope only acts on evidence produced, and so may be uninformed or misinformed. And yet once again, canonizations are not infallible acts of Popes. This is lucky, and I accept these statements with gratitude; they wipe away a number of historical difficulties which I previously felt, such as the wisdom of invoking St. John Nepomuk, who never existed; or a Grand Inquisitor like St. Peter Arbues, whose friendship in this life I certainly should have avoided.

One comment only we will make on this note. It is not our business to decide how far canonizations are infallible acts of Popes; but Mr. Nevins must be aware that the Vatican Council assigns infallibility in questions not only of faith but of morals to their official utterances, and whatever mistakes of fact may conceivably be made as to the character or even the existence of a given Saint, it is difficult to understand how the Pope could, without prejudice to his infallibility in morals, be mistaken as to the type of sanctity or "heroic virtue" held up to the faithful for imitation. Now, in the case of Francis there was at the time no mistake about the facts, however studiously or ignorantly they may be glossed over by his modern biographers to suit the feeble taste of an age which condemns duplicity and violence even in a sacred cause. Mr. Nevins relies mainly for his facts on the biographies of two earlier writers, "both Catholics, and both *ardent admirers of de Sales*, the Abbé Marsollier and Loyau d'Amboise." The first of these works was dedicated to the reigning Pope, the second to the Archbishop of Paris. Both of them, together with other equally unimpeachable authorities, were quoted in an article by the Rev. L. W. Bacon published two years ago in *Macmillan's Magazine* under the title of "Two Sides to a Saint," and which appears to have first directed Mr. Nevins's attention to the subject. There is no doubt untrustworthy matter in the earlier as well as in the later Lives of St. Francis, but two points come out with unmistakable clearness, which were not then regarded as discreditable to him, but which his modern panegyrists have carefully suppressed—his systematic duplicity, and his unscrupulous recourse to persecution when other means of effecting his purpose failed.

The first point, which can only be noticed briefly here, was most disagreeably illustrated from his youth upwards. Francis, when a mere schoolboy at Paris, determined without the knowledge or consent of his parents, who had very different views for his future, to devote himself to the priesthood, and made a vow of celibacy at the church of St. Etienne-des-Grès, which he afterwards renewed—again without his parents' knowledge—as a young man at Padua. At length when his costly education, designed by his father to fit him for a secular career, was completed, he returned home at the age of twenty-six, and was "thunderstruck," say his biographers—though we hardly see why—to find that arrangements had already been made for his marriage with a charming young heiress in the neighbourhood, aged eighteen. Still Francis was so far from explaining to his father the real state of the case and declining to see the young lady—which was obviously his

only honourable course, if he intended to persevere in his resolve—that he not only allowed himself to be introduced to her as her acknowledged suitor, but paid her frequent visits. The natural result followed; Mademoiselle de Végy fell over head and ears in love with the handsome young count, who fully reciprocated her feelings. But now, when he was bound in honour and good feeling to carry out his engagement, Francis chose to bethink himself of his vow—from which, as his mother reminded him, he could easily have got dispensed, not being in orders—and managed privately to obtain from the Pope the vacant post of Provost of the Chapter of Geneva, through one of the Canons who was his cousin. Then, and not till then, when the details of the approaching wedding were already beginning to be arranged, and after he had secured for himself the highest ecclesiastical dignity in the diocese, he at last broke the news to his parents, and resolutely put aside his mother's indignant remonstrances against the gross and heartless treachery of which he had been guilty. It may be added that Francis continued through life to be not only—as has been said of a distinguished living ecclesiastic—an "apostle of the genteels," but a devoted admirer of the fair sex, one of whom he used to address in his private correspondence as "dearest girl of my heart," while writing letters of a different kind to be shown to her father and her confessor. Not that we at all mean to insinuate against him a charge of immorality, but we do mean that a man with his peculiar capabilities for charming and being charmed by young ladies was doubly culpable in trifling, as he did, with the affections of his affianced bride.

And now it is time to come to the grand achievement of the life of St. Francis, the conversion of the Chablais. Here all his biographies, though there is a notable difference between the earlier and later ones, become wildly mythical. We do not refer to the miracles which they all report, though it is due to him to say that he never speaks of them himself. That is a matter on which people are so sure to form their judgment largely in accordance with their preconceived ideas of what is probable and congruous that it is unprofitable to argue about it, and moreover it may be freely admitted that, if the popular story of his mission is to be accepted at all, it would be far more marvellous without the miracles than with them. The tale as ordinarily told, and summarised in the Breviary lections for his festival, is briefly this; that being sent as a missionary to convert the heretic population of the Chablais, he devoted himself to the arduous task with indomitable perseverance amid the most terrible trials and hardships, and constant perils of death, till at length the eloquence of his preaching and the still more winning saintliness and gentleness of his character overcame the inveterate prejudices of a coarse and brutal population and the 72,000 heretics of the county returned to the true fold. This enumeration is absolutely asserted in the Breviary, and we observe that a recent convert writer against Anglican Orders, who might have been expected to know better, goes out of his way to reproduce this exploded fable, with the cautious reservation, "He is said," &c. The numbers might as well have been put at 700,000; nor is it only the numbers, but the whole character and scenery of the region, that is metamorphosed. The lovely southern shores of the Lake of Geneva, which may be said to blossom as the rose, are turned into a waste and howling wilderness where eternal winter reigns, and its quiet good-humoured peasant denizens into a set of fierce savages thirsting for the blood of the meek apostle, who came unarmed among them taking his life in his hand; even the short three miles' walk from the Castle of Allinges, where he was comfortably housed, to Thonon becomes a perilous and fatiguing journey, in which the pangs of hunger and thirst had to be constantly endured. The facts are these. The Duke of Savoy, having obtained the Chablais from Henry II., King of France, with an express stipulation in the treaty that the Protestant religion, which the inhabitants had professed for nearly sixty years, should not be interfered with, was anxious on political grounds to effect their return to Catholicism, religious disunion being generally at that period considered dangerous to the State. Francis and his cousin—the priest who had procured him the provostship—were chosen for this mission, having of course the whole civil power at their back; but it was thought prudent at first to try gentle means, and the people were again solemnly assured that their liberty of conscience should be respected. The missioners were lodged at Allinges and began to preach in the great church at Thonon, but in spite of all advantages, physical and moral—and a little mild compulsion was adopted from the first—two years of devoted preaching, "sweetness," miracles and all, produced next to no result. The converts could be counted on the fingers. Then Francis thought it was time to act. He crossed the Alps in November and interviewed the Duke at Turin, in order to impress on him the obligation of reducing his heretical subjects to the faith, and the non-obligation of observing the terms of the treaty to which he had sworn. We have no room here for long extracts from his memorial, which occupies five pages of Mr. Nevins's instructive pamphlet, but a few salient points may be jotted down. The Duke must not adopt "the maxim, injurious to God and man," that children are the property of their parents; he must prevent heresy from opening schools; he must burn all heretical books, and allow no more to be published; he must banish Protestants from all public offices, and restore the ecclesiastical property now in the hands of Protestant pastors to its proper owners, the priests, and he must establish the Jesuits in the province; also converts should be liberally rewarded; and, last but not least, "it is necessary to scatter terror through the whole population by wholesome edicts." By such means his Highness would "assure the triumph of the faith in the Chablais," and "extirpate the growing canker of heresy from the land which Heaven had given him."

The Duke, in spite of the remonstrances of his Council, was nothing loth to listen to these mild suggestions, and thenceforth the mission of Francis, which Marsollier admits to have hitherto proved a failure, became a no less conspicuous success, the more so as he proceeded further to invoke the aid of the too famous, or infamous, "Martinengo regiment," which had gained a terrible name already for its ruthless butchery of men, women, and children, and white-haired Protestant pastors. Yet even with these strong-handed auxiliaries success was not complete, and in the autumn of 1598 Francis induced the Duke, who was evidently a tool in his hands, to visit Thonon in person. Orders meanwhile were given for the suppression of the Protestant worship throughout the Chablais. The closing scene shall be told in Mr. Nevins's words:—

> The day after this order was given, the Duke ordered the Protestants to assemble at the Town Hall, and lined the streets and place with the accursed Martinengo regiment. Silence being obtained, the Duke harangues them, and declares that although converts have been made, yet he cannot allow rebels to exist who will "se perdre eux-mêmes pour le temps et pour l'éternité," that "he regarded 'ces endurcis' as the enemies of God and *particularly as his own opponents*"! He winds up by ordering those who wish to be of the religion of their Prince to go to the right, those who will remain obstinate to go to the left. They do so. Then the Duke addresses most amicably the sheep, but the goats he thus harangues: "You, then, wretches, dare in my presence to declare yourselves God's enemies and mine. Go, go out—I deprive you of your offices and dignities and *banish you for ever from my states.* I prefer to be without subjects than have such as you who always set me at defiance." He then signed to his guards, who turned them out.
>
> Marsollier then relates that de Sales with "son extrême douceur" begged the Duke to let him make another attempt to convert them, and before the day was over François had convinced them all but a few who passed over to the other side the lake to Nion!

The speech is given at length by the writer in *Macmillan.* It remains to add that, according to contemporary computation, the total population of the district from which Francis drew his 72,000 converts was under 4,000. A term of six months was allowed them to choose between conversion and exile, after which time all dissent from the established religion was rigorously suppressed. Thus "extreme sweetness" gained the day at last; but the Christian apostle triumphed by much the same means as are prescribed by the Prophet of Islam—"the Koran or the sword." It may be said that in this he simply conformed to the spirit of his age, when Roman Catholics and Protestants alike thought it a duty to repress by force all dissent from the dominant creed. Be it so; but the special praise claimed for Francis, at least by all his modern panegyrists, is that he was above the spirit of his age, and steadily refused to carry on a spiritual warfare by carnal weapons; and it is true that he often used language pointing in this direction. But that only reveals another unpleasant feature of his character. It shows that the duplicity which was so unamiably exemplified in his youthful career, when he won the affection of Mlle. de Végy with the deliberate intention of rejecting it, remained with him through life. Persecution is not made more tolerable by being sheltered under a flimsy pretext of imperturbable suavity, or because the apostle discoursed eloquently from the pulpit while the ruffians of the Martinengo regiment watched the church doors. His subsequent missionary labours in the Pays de Gex were conducted in the same manner as the previous campaign in the Chablais, except that he wasted less time in unprofitable preliminaries, and began with the use of force. We are far from denying that there was much that is really noble and saintly in his character, and are quite content to give him the full benefit of whatever excuse he may derive from the current opinion and practice of a persecuting age. But it is impossible for those who know anything of the actual circumstances to listen without a smile or a sigh to praise bestowed on his "freedom from bigotry in an age of persecution," and on the marvellous success of his unwearied apostolic toils, which was due almost exclusively to the wholesale employment of bribery, treachery, and dragonnades. And it is very difficult to evade the conviction, which Mr. Nevins shrinks from directly owning but scarcely affects to conceal, that the authority—every consistent Vaticanist must say the infallible authority—which canonized him thereby once more set its seal to the rightfulness of religious persecution.

INTERFERENCE.

THERE is no domestic or social habit—or vice, as some regard it—that incurs more odium, considering what the offender's intentions generally are, than what is variously called interference or meddling. Men differ naturally and blamelessly in the way in which their minds receive the business and the scenes which pass around them. It is natural to some tempers to view things external to themselves as mere pictures—moving panoramas, in which their concern is only as lookers-on; and it is equally natural to others to feel a certain connexion and relationship with everything with which their senses come in contact. The fact that they see and hear anything involves a certain share in the action. The man asks himself, Have I anything to do here? and if things strike him as going wrong, or in what he thinks not the best way, again he inquires of himself, Can I set it right? Now

this impulse is what brings about the temptation to interfere and meddle. It belongs to the busy and sanguine as opposed to the placid, resigned, fatalist temperament, that thinks only; that can observe, and let alone; that either takes little notice of things outside its immediate duties or interests, or, noticing them, recognizes no work or duty as consequent on its observation. Those tempers have each their merits and defects. The defects of the interfering temper are palpable enough. They are among the irritants of society. The most generous, merely gratuitous, interference gets little thanks. Nobody can interfere in a matter in which he has no personal interest, and therefore no obvious right to interpose—nobody can thrust himself forward in a matter of nicety where he has no direct business—without incurring more blame and ill-will than praise or thanks. If benevolence in the busy form does not bring its own reward it brings no other. There is always somebody to take offence who would rather run the chances incurred by his own unrestrained action than be benefited by a meddling go-between. Few persons are dispassionate enough to respect the impulse in another which sets him tampering with their liberty of action, advising or meddling irrespectively of their inclination, habits, and will. The rights of men are more dear to them than any benefit to be gained by disregarding or trampling upon them. Yet the interfering temper, when allowed its free exercise, thinks little of this. However much it desires the goodwill of others, there is a self-reliance fostered by indulgence which turns the attention entirely away from misgiving and self-questioning. It proves its popularity to its own satisfaction by a tacit syllogism. Men love their benefactors; I am a benefactor; therefore men love me. A thoroughly genial busybody will go on through life irritating all the human nature it comes across, practically unconscious of giving offence, and never taking a lesson from failure.

In treating this subject the pen insensibly slips through the various declensions from the original amiable impulse – from interference to meddling, from meddling to the busybody. Yet it is a truism to say that interference is often a duty. It depends on the intellect and the moral nature of the active temperament whether we call its action legitimate interference or impertinent meddling. Both start from the same native bias; but this is dignified into high utility, or dwarfed into the troublesome and contemptible, by the purity or pettiness of intention, and the degree of judgment and self-restraint exercised. It is where interference becomes a blind habit that it descends in the scale. Society offers abundant warnings in this matter to those who are open to receive them. People must be of a tough, insensible nature indeed to persevere in this form of intrusion against the coldness and the snubs of their equals; but the fact that we are not all equals still leaves room for its unhealthy growth. It is this that constitutes one of the perils of benevolence, technically so called, to those who devote themselves to good works. Men cannot dedicate themselves to the business of benefiting their neighbours without some risk to themselves. Undue interference is one of these risks. Kind-hearted and benevolent women have often been charged with meddling and exceeding their rights, and have had gradually to retreat from the attitude of dictators in the matter of dress and household economics before the growing independence of the classes once called "lower," who reject the patronage of their goodwill at the price they set upon it of submission to their authority; the fact that the well-meaning ladies believe themselves to know better not constituting this legitimate authority. This, however, is an instance of the more excusable form of the failing, one often unduly charged, indeed, on persons engaged in an arduous, self-denying, and thankless work. The misleading consciousness of good intention is the bane of the busy temper in more important cases than the indiscretions of district visitors. Men who follow its lead are not commonly held in check by severe self-study; intent on benefiting their neighbours by enforcing their own opinions and practices upon them, they are apt to take their own motives for granted. There may be unconscious injustices and infusions of personal feeling that are never guessed by the mind absorbed in setting other people to rights, and alive only to the weight of its own counsels and the importance of things being carried out according to its notions of fitness. This is the state of mind that makes a man meddle in what does not concern him. It has grown upon him by indulgence, till he regards the living world around him as a theatre for the display of his own sense, discernment, conscience, and activity. In everything outside himself that admits of interference he sees a call to interfere. A sense of power, of a wider range of observation, of a deeper insight and finer tact, grows upon him, and with this a contempt for the capacity of others, till there is nothing that is right, nothing but admits of improvement and remodelling from his hand; till there is no sanctuary of private opinion or practice that must not be invaded; no pleasure or taste that must not be touched up, heightened, and have a character given to it, by some infusion of his personality.

Of course all interference implies the assumption of authority in some form or other. This of itself tells nothing against it. All depends upon the truth and fairness of the assumption. Relationship, friendship, a sense of justice, age, experience, knowledge—all constitute a right to interfere, given the fit occasion; all confer authority. Urgency gives a right to intermeddle apart from all these; only the urgency must be real, the occasion important enough, and the impulse stirred by the occasion, not by a bustling habit. The great question with men is this of authority. The first inquiry is not as to the value of the action or suggestion, but as to the right to enforce it. An acknowledged authority may interfere in a very harsh manner, and yet excite less irritation than words that can only assert themselves pragmatically as the sentence of a superior judgment. And authority itself may dictate on supreme questions though it is rebelled against in trifles which seem the inalienable right of the individual. Horace Walpole observes upon this in reporting events at Madrid, where, after a series of assassinations, an edict had been issued commanding that hats should be cocked, cloaks shortened, and capes laid aside. An insurrection was the consequence of this interference with costume. "A nation that has borne the Inquisition cannot support a cocked hat!"

On this subject Barrow delivered himself with characteristic point. Meddling was a topic of his day. He enlarges on it, not only as it concerned public matters, but as it touched the liberty of the individual, on which he expresses himself with a sensitiveness which suggests an aggrieved personal experience. "Every man hath," he says, "a particular gust for diet, for garb, for divertisements and disports arising from particular complexion and other unaccountable causes; and fit it is that he should satisfy it; it is enough that what he doth seemeth good and relisheth to himself." There was probably less interference then with the ways and manners of private life than society exercises now, either as a whole or through its more busy members. It was a more impertinent proceeding to come between a man and his humour. Certainly, humourists are a diminishing class. These "gusts" of which the preacher speaks are nipped in their development through some form of interference or other. As for the question generally, he allows that there are legitimate occasions for meddling with our neighbour's liberty. We may interfere in his blind career of ruin or grievous mischief. "If he hath not his wits about him we may supply him with ours in such exigencies"—a way of putting the case, we may observe, that leaves a great deal to the judgment of the man who throws himself into the breach; as it is the nature of this temperament to be always seeing exigencies, and feeling an imperious call to "thrust eyes, tongue, and hand into his neighbour's business, prying into that which is done, dictating this or that course, usurping a jurisdiction." The moralist raises quite a hurly-burly of words round the busybody—the meddler in other men's matters, the raiser of combustions; his turbulency, irregularity, disorder, pragmatical curiosity, and exorbitancy; contrasting, in a fine simile, these disturbing qualities with the majestic calm of the quiet temper. This quiet is not "a total forbearance from action, not a fastidious drowsy listlessness, not a senseless indifference concerning the matters of others, but such a motion as the heavenly bodies do keep, which so move as they seem ever to stand still, and never disturb one another." After all, the question must be left to individual conscience and judgment in each case which seems to bring with it a call to interpose between a man and his own modes of conducting his affairs. The busy temper cannot and need not wholly suppress itself, but these hints at exorbitancy in the mode may serve as a wholesome check.

A great deal of the outcry against meddling comes from persons who most need some interference with the swing of their course of action. How violently indignant, for instance, are young people when engaged in a course of excitement or dissipation, or any career of passion or self-will, at a word or hint of interference; how jealous of the mere suspicion of it; how insolent in thought, and often in word and act, against the offender. In all headlong doings of any kind and at any age there is the same resentment at any sense of external check, and this probably in every case because there is an enemy in the garrison which responds to the attack from without. There are two classes of mind that are patient of interference—those of the equable yielding order, who have no passion for their own way, who can look at both sides of a question, who are not carried away, who can deliberate if liberty of action remains to them, who can submit to external pressure as a thing to be, when powerless to resist it; and those who are so strong in their own judgment and intention, so confident in their ability to carry their conclusions out, that they are not afraid of it. In fact, some opposition is welcome to such minds, as making them feel their strength and imparting a sense of power. They can accept even unjustifiable intervention from other people, as feeling that no external influence can have weight or force beyond what they choose to give it. All angry feeling against interference is the result of weakness of some sort—weakness of position and of circumstances (a case which excites sympathy), rendering the victims of meddling no longer masters of their own affairs; or weakness of moral ground, the weakness of a mind not in harmony with itself.

OLYMPIA AND THE GERMAN GOVERNMENT.

THE report that the grant which has been voted for the last five years by the German Reichstag for the excavations at Olympia will not be continued in the present year has been received with something like consternation in the archæological world. It is true that notice to this effect was given last year to the directors of the Olympian expedition in Berlin. But it was generally supposed that the extraordinary interest taken in their operations, the brilliant results with which they had been attended, and, above all, the consideration that one year more would suffice to complete the great work, might induce the Government of Germany and the Reichstag to reconsider their decision. It is to be sincerely hoped that they will yet do so; but, if they do

not, it would ill become Englishmen to utter a single word of reproach. Whether they stop or renew the liberal grant by means of which so many of the most interesting historical and archæological problems have been solved, the German Government and people are entitled to the gratitude of every lover of classical antiquity.

The interest felt in Olympia is not without abundant justification. There are very few spots on the earth's surface round which a greater number and variety of human interests are gathered than are indissolubly attached to that little valley in Elis, which, in the form of an irregular oblong, is bounded by the rivers Alpheios and Kladeos on the south and west, and Mount Kronion (Saturn's Hill) on the north. It is true that, like the Ilissus near Athens, both the rivers and the valley are small, and not to be compared with the Mississippi and the vast plains through which it flows (as we were told some years ago at Manchester); but that little valley has been trodden by a greater number of men who have illustrated the annals of the civilized world and shaped the destiny of the human race than the whole Western hemisphere. We do not know for what reason the Peloponnesians chose this spot for their meeting-place; but they may well have done so on the ground of its extraordinary beauty. Looking eastward from the little village of Druva on the lofty right bank of the Kladeos, the spectator has the hill of Kronos and Mount Olympos on his left, and the richly-wooded heights which skirt the south bank of the "most sweetly flowing" Alpheios on his right. Before him is the glorious plain now occupied by hundreds of Arcadian workmen; and beyond it lie successive ranges of hills covered with a rich southern vegetation, whose soft undulating lines cross and melt into each other. The distant background is closed in by the rugged mountains of "happy Arcadia," the haunts of Pan and his beloved Echo.

The name of Olympia is connected not only with the earliest history, but with the oldest mythological traditions, of the Greek race. Kronos was the first King of Elis in the Golden Age, and the first temple erected in his honour stood on the hill which now bears his name. In this favoured spot Zeus himself was born, and was entrusted by his anxious mother Rhea to the Idæan Daktyls, the gigantic primæval blacksmiths, who came from Mount Ida at her call. Herakles, who was one of them, raced his brother Daktyls in the plain, and adorned the victor's brows with an olive garland. Here, too, Kronos and Zeus raced for the sovereignty of Heaven and Earth; and here Apollo outran Hermes in the course, and beat Mars himself in boxing. After the gods come the mythological heroes. In a chariot race in the Eleian plain Pelops won from the betrayed and defeated Oinomaos his daughter and his kingdom. In memory of the dethroned monarch, his grandson, the second Herakles, the son of Alkmene, renewed the Olympian contests, and adorned the victor with the crown of "silvory olive" which he brought from the country of the Hyperboreans, "for the glens of Pelops grew no fair trees," and "it seemed to him that the sacred enclosure was at the mercy of the keen rays of the sun":—

ἀμφὶ κόμαισι βάλῃ γλαυκόχροα κόσμον ἐλαίας· τάν ποτε
Ἴστρου ἀπὸ σκιαρᾶν παγᾶν ἔνεικεν Ἀμφιτρυωνιάδας
μνᾶμα τῶν Οὐλυμπίᾳ κάλλιστον ἄθλων
δᾶμον Ὑπερβορέων πείσαις Ἀπόλλωνος θεράποντα λόγῳ·
πιστὰ φρονέων Διὸς αἴτει πανδόκῳ
ἄλσει σκιαρόν τε φύτευμα ξυνὸν ἀνθρώποις στέφανόν τ' ἀρετᾶν.

Pind. *Ol.* iii. 13.

'Twas from the shady sources of the Danube that of yore the son of Amphitryon brought the tree, to become a most honourable memento of prizes won at Olympia, after persuading the nations of the far north, the worshippers of Apollo, by his words. In friendly feeling he requested for the much-frequented racing-ground of Zeus a plant that should afford a shade for all men in common to enjoy, and which should be used as a crown for deeds of valour [Paley's Translation].

It is evident from these and other legends that in the very earliest ages this valley had been the scene of local festivities and gymnastic contests—had been constituted in fact the common "playing fields" of the Peloponnesian youth. When we at last reach the solid ground of history, we meet first with the name of Iphitos, King of Elis, who came into the Peloponnesus with the Herakleidai, and was contemporary with Lycurgus the legislator. Finding the country torn by intestine feuds, he consulted the Oracle at Delphoi for a remedy, and was directed to sacrifice to Herakles at Olympia, and renew the games. To render the meeting of the hostile tribes possible, Iphitos and the Spartan Lycurgus, the most powerful of the Peloponnesian princes, proclaimed about 884 B.C. the *ἐκεχειρία* (hand-holding), or Sacred Truce, to be observed by all as long as the games continued; and they made of Elis, what it remained through succeeding centuries, a holy inviolable land of peace and Hellenic brotherhood. From this time forward the games were regularly held every fourth year in the first month after the summer solstice, when the moon was full; but it was not until about a hundred years later, in 776, that the names of the victors began to be recorded, and the Olympian æra used in the computation of time. Henceforward, for a period of more than eleven hundred years, in spite of the everlasting feuds which devastated the rest of Greece, this wonderful festival brought together all that was beautiful and magnificent, gifted and glorious, in the most beautiful and gifted people of the world. As long as Greece was free, only men of Greek origin were permitted to enter the lists; but at last barbarian conquerors forced their way into the sacred precincts, and assembled Greece was humbled by the presence of an Alexander and outraged by the victory of a Nero. Yet the humiliation was not all on the side of the Greeks. Macedonian kings and Roman emperors were proud to appear on the Eleian plain, and feigned Hellenic descent to excuse their intrusion.

During the greater part of this long period Olympia was being adorned by the piety and pride of visitors and competitors with magnificent temples and beautiful statues. Besides the great temple of the Panhellic Zeus, built by a local architect, Libo, early in the sixth century B.C., which contained the statue of gold and ivory by the hand of Pheidias, we learn from Pausanias that there was in the Altis a probably still older temple of Here. It also contained Doric temples of Hestia and Demeter, sanctuaries of Eileithyia and Aphrodite Urania and Heroa, of Pelops, "who," says Pausanias, "was as much reverenced above other heroes as Jupiter above other gods," and of his wife Hippodameia. The Altis was further adorned by public halls and colonnades, and by innumerable statues of gods, heroes, and victors in the games, which were ranged along the public ways, set up in front of temples, and interspersed among the sacred groves. Of Zeus alone we read of twenty-seven statues, besides the bronze figures of this god called Zanes, which were erected from the fines inflicted on those who violated the laws of the games. There were also statues of Athene, Demeter, Poseidon, Hestia, Artemis, Hermes, Dionysos, Amphitrite, Asklepios, Hygieia, Herakles, and Nike. The victors, too, during nine hundred years made use of their privilege of erecting statues of themselves in honour of their victories. Pliny, who writes after Olympia had been plundered by Sulla and others, says that in his time there were still three thousand statues in Olympia; and Pausanias, who fills two books of his work with a description of its glories, describes two hundred and thirty selected works of plastic art.

The external splendour of the Olympic festival was maintained, perhaps increased, under the Roman emperors; but the sentiments of religion and patriotism which were its inner life were stifled by the corrupting miasma of foreign despotism. Olympia fell on evil days; the very Roman governors and emperors who loved to display their magnificence and power in her stadion and hippodrome did not scruple to rob her of her choicest works of art; and even the chryselephantine Zeus of Pheidias was carried off to Constantinople towards the end of the fourth century. The names of the victors, once renowned throughout the civilized world, were no longer thought worthy to be recorded; and in 394 A.D. the Olympic festival was abolished for ever by the Emperor Theodosius I. Two years afterwards Alaric and his Goths occupied the neighbouring hill of Pholoe, and finished the work of plunder and devastation which Roman conquerors had begun. They took a very practical view of the value of metal works of art; and it is therefore not wonderful that scarcely one of the many thousand bronze statues which adorned the Altis has come down to us.

Having flourished for a thousand years, Olympia now slumbered in silence and oblivion for a still longer period, hiding her desolation under the deposits of the Alpheios, which at some unknown period must have burst its usual bounds and deluged the whole plain. We hear nothing more of Olympia until the year 1766, when it was visited by our countryman, Richard Chandler. In Germany about the same time the great founder of archæology, Winckelmann, was composing his work on the history of art, and in a letter to a friend expressed his ardent desire to excavate the Olympian stadion "with a hundred workmen." Towards the end of the last century Olympia was again visited by Fauvel and Pouqueville, and by Dodwell, Gell, and Leake, who fixed the site of the Temple of Zeus, and by Stanhope in 1813, who made the first topographical plan of the valley. Of a more serious character was the French expedition of 1829, after the liberation of Greece, the members of which, however, only stayed six weeks. They discovered the famous Metopes of the Temple of Zeus, representing Herakles and the Bull, the Nymph on the Rock, &c., which form some of the principal treasures of the Louvre.

But the glory of restoring the sacred Altis to the light of day was reserved for the new German Empire. Nearly thirty years ago Professor Curtius, then a young man, took up the idea of Winckelmann, and in a lecture at Berlin gave eloquent expression to his ardent desire to excavate the plain of the Alpheios. "When," he asks, "will its lap be once more opened to bring to light the works of the ancients? That which lies buried in the dark depths is life of our life." His highest aspirations were fulfilled, though late. In 1874 he was himself sent to Athens to arrange the provisions of a treaty with Greece, empowering the Germans, under certain conditions, to make excavations for five years in the plain of Olympia. His mission was completely successful, and the terms agreed to bear honourable testimony to the purely scientific views of the German Government. The Reichstag, with the general applause of all Germany, voted the necessary means—namely, 7,500*l.* per annum, for five years. A Board of Directors, consisting of Professors Curtius and Adler, and Legations-Rath Dr. Busch, was appointed, and the practical superintendence of the works on the spot was entrusted to Mr. Adolph Bötticher and Dr. Hirschfeld, who were superseded, before the visit of the present writer, by the learned archæologists Professors Treu and Furtwängler, ably assisted by Mr. Borrmann, the architect, and Mr. Dörpfeld, the engineer. Operations were commenced in October 1875; and, in accordance with the terms of the treaty, the Temple of Zeus was made the starting-point. From this centre trenches were dug radiating in several different directions—to the south, west, south-west, north-west, and north, one of the

first objects being to find the boundary wall of the Altis. This sacred inclosure formed an irregular oblong of not more than 400 by 200 yards in the Olympian plain, the longest sides of which were under the hill of Kronion on the north, and towards the bank of the Alpheios on the south. The Altis, which Pausanias says is Elean for ἄλσος, a grove, was the holy τέμενος, or sacred field, which Herakles marked out of yore and dedicated to his father Zeus.

Without any reference to the dates at which they were severally laid bare, we shall now proceed to enumerate the principal results of the excavations, which have, of course, been chiefly, though not entirely, confined to the Altis. We shall speak first of the buildings, the most important of which in every way is the Doric peripteral temple of the Panhellenic Olympian Zeus. This building is only second in size to the Temple of Athene Alea at Tegea, being about 200 feet long by 90 broad, and about 68 feet high. It is built of the testaceous limestone which the Greeks called πῶρος; and the pillars, of which there were six at each end and thirteen on each side, were covered with a thin coating of light red cement to conceal the rather unsightly appearance of the rough stone. The diameter of these pillars is greater than that of the Parthenon columns, being considerably more than six feet in diameter. The next in size and importance is the Heraion, or Temple of Here, which lies almost due north of the Temple of Zeus, close to the north wall of the Altis. The proportions of this building, which is also Doric and peripteral, are probably unique in the history of architecture; for though only 60 feet broad, it has a length of 150 feet, and has six pillars at each end and sixteen on each of its longer sides. Proceeding eastward of the Heraion along the north wall of the Altis, we come to the Exedra of the Herodes Atticus, a large building of brick, erected by the generous orator at his own cost, in connexion with the aqueduct by which he had greatly increased the salubrity of Olympia. The Exedra stood on a terrace rising by two steps above the plain, and consisted of a large marble reservoir, at each end of which was a small circular temple with Corinthian pillars, one of which contained the statue of Marcus Aurelius and the other of Faustina. Behind the reservoir, and on the upper step of the terrace, was a semicircular apse, round which stood twenty-one statues of members of the Imperial House, of Herodes himself, and his wife Appia Regilla, and his children.

Next to the Exedra on the east come the foundations of eleven "Treasuries" belonging to different States, the mere enumeration of which recalls the widespread celebrity of the Olympian games. The peoples here represented are the Sikyonians, the Carthaginians, the Epidamnians, the Byzantians, the Sybarites, the Cyrenæans, the Selinuntians, the Metapontians, the Athenians, the Megarensians, and the Sicilians of Gela. Between the second and third and the tenth and eleventh of these Treasuries run two narrow paths leading to the Temples of Eileithyia and Aphrodite Urania, higher up the hill Kronion, the sites of which are well known, though they have not yet been excavated. In front of these Treasuries, which line the northern boundary of the Altis, stood the Metroon, or Temple of the Mother of the Gods; it is mentioned by Pausanias, but he speaks of it as a very large building, which it certainly is not. He also says that it was filled with statues of Roman governors, many of which have been found. In a line with the Metroon, and in front of the Treasuries, the bases of the Zanes, mentioned above, have been found. Still further to the East, along the wall of the Altis, the excavators found a tunnel, 65 feet long and 10 feet wide, which is no doubt the κρυπτή—the subterranean passage into the stadion, which lay outside the Altis. Parallel with the eastern wall of the Altis ran another interior wall forming with it a long gallery, which began at the κρυπτή and occupied the whole Eastern side of the sacred enclosure. This was probably the ποικίλη, so called from the pictures which adorned it, which was also known as the "Stoa of the Echo," from its sevenfold reverberations. On the western side of this long portico were forty-six slender Ionic columns, and a second row of pillars in the middle of it divided it into two long aisles.

Towards the north-western corner of the Altis, a short distance to the south-west of the Heraion, is the Philippeion, a small circular temple or Heroon, surrounded by eighteen Ionic pillars, and surmounted by a conical roof. The date of this building is certain, for it was erected by Philip of Macedon in this centre of Greek glory, to celebrate the downfall of Greek liberty at Chæroneia. It contained statues of Alexander, his mother Olympias, Philip himself, and his parents Amyntas and Eurydice, all executed by the famous sculptor Leochares in gold and ivory. To the west of the Heraion, again, in the corner where the northern and western walls of the Altis meet, is a large complex mass of buildings, supposed to include the Bouleuterion, the Prytaneion, and the Temple of Hestia. One of the latest discoveries is that of the Pelopion, which was found, in accordance with the description of Pausanias, to the north of the Temple of Zeus, between it and the Heraion. Parallel with the southern wall of the Altis runs a broad street which is still bordered by bases of very different sizes, intended to sustain statues and other offerings. Where this street debouches on the western wall of the Altis lies the Gate of exit, on issuing from which you come to the interesting Byzantine basilica, which is probably a part of the studio of Pheidias. This scene of the great artist's miraculous creations was held sacred by the Eleians, who maintained a number of permanent officials called Phaidruntai (cleansers), whose duty it was to preserve it from decay. Due north of the Byzantian church is the Gymnasium, which is also outside the Altis, and of which the ground plan, as revealed by the excavations, agrees exactly with the description of Vitruvius.

We proceed to speak of the remains of plastic art which have been found in the ruins of Olympia. The first great prize was the Nike of Paionios of Mende, which was found in December 1875, about twenty-six yards to the east of the south-east corner of the Temple of Zeus. It was hailed with delight as the first specimen of Greek work of which both the design and execution could, with absolute certainty, be traced to an artist of the Pheidian period. Pausanias says that "those of the Dorian Messenians, who once took Naupaktos from the Athenians, offered the statue of Nike on a pillar." This pillar, which is triangular and composed of eight blocks of stone, has also been discovered, with the inscription recorded by Pausanias. The figure of Nike is of Parian marble, and rather more than six feet in height. The Goddess of Victory is represented descending from on high, and slightly bending forward towards the ground. Her right foot just touches the centre of one side of the triangular base; the left leg is bare; and the long flowing garment clings closely to the right leg, and flutters behind her in the breeze, as she descends with easy graceful motion towards the earth.

One of the principal objects of the excavations about the Temple of Zeus was the discovery of the pedimental groups and Metopes, so fully described by Pausanias. We learn from him that the eastern pediment was entrusted to Paionios and the western to Alkamenes. The subject of the former was the Chariot race between Oinomaos and Pelops for the sovereignty of the Peloponnesus; and that of the latter, the battle of the Centaurs and Lapithae. Of both those groups most of the figures have been found, and may be seen at Olympia. They agree in almost all respects with the very full description given of them by Pausanias in the tenth chapter of his fifth book. A still more important discovery from an artistic point of view is the so-called "Atlas Metope" from the eastern façade of the Temple of Zeus, which is by far the best of the architectural sculptures which have as yet been found at Olympia. In this beautiful high relief Herakles is represented standing with his neck bent beneath the weight of the world, which he is temporarily sustaining for the Titan Atlas. Atlas stands before him with the apples of the Hesperides in his hand; behind Herakles stands a maiden, one probably of the Hesperides, who raises her hand to the burden which oppresses the hero as if she desired to aid him.

We have reserved to the last the mention of the greatest prize which fortune has bestowed on the skill and zeal of the German excavators—namely, the statue of Hermes carrying the infant Dionysos, by Praxiteles. "In after times," says Pausanias, "other statues" (*i.e.* than those made of gold and ivory) "were dedicated in the Heraion at Olympia—namely, a Hermes of marble carrying the infant Dionysos, the work of Praxiteles." The god is here represented in a somewhat unusual light. He is not the swift messenger of the gods; still less the stern driver of the dusky herd of hapless ghosts "non lenis precibus fata recludere," but a charming youth, in the very springtide of his beauty, attending on a little child. He is leaning his arm on the stump of a tree, a posture which gives to his form an easy air of negligence and an undulating grace. His whole demeanour denotes perfect repose, and the expression on his beautiful face as he looks at his precious nursling is ineffably sweet and sunny.

Such are some of the main results of the famous German expedition to Olympia; and it is sad to think that so great a work, so admirably begun, may now be interrupted. There is room, however, for hope that the decision of which we have spoken may be reconsidered.

LIVERPOOL AND GENOA.

AMONG the many ways of escaping an English winter few are more likely to be pleasant than a voyage round the Mediterranean. Travellers subject to sea-sickness had better go to Italy by land; but those who are by nature exempt from suffering of this kind, as well as those whose sufferings endure but for a day, may find a steamer quite as much to be enjoyed as a yacht. The thorough-paced yachtsman, indeed, affects to despise "teakettles," but the same calm weather which renders the passage of the Bay of Biscay a happy episode in a steamer voyage leaves the yacht with flapping sails in the trough of the sea, turning almost upside down between great smooth rollers from the Atlantic. There is more variety, too, in the company on board the steamer. If you have come provided with books or work to be done, you are tolerably indifferent as to your fellow-travellers; but there are long hours when it is impossible to read or write, and a cheerful acquaintance on board deserves to be cherished. Though it has been well said that a man need never want a subject to interest him so long as he has himself, a sea voyage in uncongenial society tests one's mental resources, and affords an opportunity of finding out what is the pleasure, enjoyed by so many people, of being dull. Steamers for the Mediterranean generally sail from that "hamlet of Walton" which, like London, the only larger town in the kingdom, possesses the distinction of a name almost certainly Celtic. Liverpool is not a "city" yet. If the schemes for endowing a bishopric of Liverpool are ever carried out, the town, it may be presumed, will receive the same brevet rank as little St. Albans. Not so much a

nucleus for suburbs as London, it is spread, under various jurisdictions, in many different parishes and at least two counties, round that "lower pool" of the Mersey from which the largest township is sometimes said to have been called. The visitor who is fortunate enough to be at Liverpool in clear weather need not fear any want of sights to interest him. The docks, some of which cover nearly a score of acres with one sheet of water; the river wall, eight miles in length; the three millions annually paid in customs; the seven millions of tons in ships for foreign trade, all these particulars are written in bewildering profusion in the local guide-books, together with the information that a native of Liverpool is called a "Dickey Sam," as a Londoner is called a "Cockney." But most travellers going to Italy will desire to refresh their artistic tastes before embarking, and will endeavour to carry away a clear recollection of fine public buildings and galleries of paintings, lest Genoa or Naples should make them ashamed. With St. George's Hall—a building which does honour to the name of its architect Elmes, as the "Burial of Sir John Moore" does honour to Charles Wolfe, since it was his only important work—as a commencement, Liverpool has gone steadily forward. The Walker Gallery, the Brown Library, the Picton Reading Room, the Mayer Museum, and other institutions of a similar character, recall the efforts of private citizens to follow the good example set by merchant princes in old Italian republics. The traveller who goes from Liverpool, say, to Genoa, will be constantly reminded of the parallel, although, in one particular at least, the great English seaport falls lamentably short. There is not a church in Liverpool worthy of the town. A great cathedral—for which Wren's original plans for St. Paul's lie ready to hand—might be raised near the Walker Galleries and St. George's Hall, and would harmonize well with both. Meanwhile we look in vain for anything to compare with St. Laurence at Genoa, or with the glorious group—church, baptistery, campanile, and cloister—at Pisa.

The Italians are too fond of talking as if Genoa were a second Liverpool. The shipping in the whole crowded harbour is about equal to that in one of the larger Liverpool docks. Genoa may be more correctly described as the Clarence Basin or Huskisson Dock of Italy. The whole value of imports and exports put together is not sixteen million sterling; so that, great as Genoa is among little Italian ports, some progress must still be made before it becomes a serious rival to a third-rate English harbour. The glories of Genoa are not of the present, but of the past, and, it may be hoped, of the future. Though its aspect has not that freshness and appearance of good repair which satisfy English eyes in Gibraltar and Valetta, it is yet one of the handsomest towns in Italy, perhaps in Europe. A marble quay, bordered by stately mansions, has a tumble-down cottage, covered picturesquely with creeping vines, for its central feature. The main approach from the harbour to the interior of the city is through an alley no wider than Paternoster Row, but composed of houses as tall as the new Law Courts. A street of palaces worthy to set a copy to Pall Mall is nevertheless so narrow that two carriages can hardly pass each other, and is wholly unfurnished with side-paths for foot passengers. The Exchange, a noble design by Alessi, stands in a dark little court. It contains the statue of a great and successful statesman—one whose career, above that of most others, reminds us that "treason doth never prosper." The statue of Cavour, in all the vulgarity of a modern costume, but too faithfully modelled by a sculptor whose mechanical skill largely exceeded his artistic power, sits in a loggia whose windows look out, across the little square, upon the inn where another and more noisy, if less successful, politician expired. The traveller from our islands will hardly fail to notice a tablet unmentioned by the local guides, since it marks the last resting-place of O'Connell on his fatal journey towards Rome. "Danieli Oconello vindici illi jurium civilium atque sacrorum Hiberniæ suæ qui quum Romam iter haberet his in ædibus cessit e vita," says the inscription, doing full honour to a second-rate hotel by describing it as "Ædes." The "Liberator's" heart alone reached Rome; his body returned to Ireland, where the round tower at Glasnevin, which marks his grave, serves as a trysting place alike for Fenians and Home Rulers. It would be impossible to guess how far the modern modes of agitation in Ireland would have pleased O'Connell; but it is certain that the two and thirty years which have passed since his death at Genoa, have left his countrymen hardly more contented than they were in his day. The concessions of a whole generation of over-indulgent legislators fail to satisfy disciples who, however closely in other respects they may have imitated their master, cannot by the widest stretch of the Irish imagination ever be described as "vindices jurium civilium atque sacrorum." There is something almost of irony in the strange chance which associates the memory of two such men as Cavour and O'Connell, men all whose ideas of statecraft, of political and religious liberty, of what was honourable and of good report, differed so widely.

If O'Connell would find himself behind the times in the Ireland of to-day, it is to be feared that Cavour would be scarcely less out of place in the Italy that now is. As the steamer enters the harbour each passenger is solemnly warned by the steward to make open confession of such contraband articles as an ounce of tobacco or a handful of cigars, since, when the custom-house officers come on board, search will be made throughout the ship and the luggage examined, even if no single traveller proposes to land at Genoa. The cost of such absurd minuteness, of such inquisitorial researches, must be vastly greater than the small sum in fines occasionally levied, especially as such fines are constantly disputed, and almost always, after long and expensive litigation, remitted. The most entertaining stories are to be heard on this subject, and on that of the equally ridiculous and equally futile postal regulations of "Italia Irredenta"; but the traveller, anxious to notice what has been rather than what is, puts them all down to a certain morbid or youthful craving for interference which seems to beset young nations. The money spent on the annoyance of tourists would extinguish brigandage if more discreetly applied. "Dirt is matter in the wrong place"; and the army of custom-house officers who obstruct your landing in Italy might be better employed in taking care of the property which they suffer you to carry with you. In strange contrast to the English seaport from which you have come, you find Genoa crowded with useless, half-drilled soldiers, who cannot even walk in step. You hear everywhere of towns depopulated for want of drainage, and of fevers raging for want of pure water; and you hear at the same time of vast ironclads being built in Spezzia, and of the casting of hundred-ton guns. The price of a man-of-war for which all Italy cannot provide a crew of real sailors would drain Leghorn, or bring clean water to Venice.

Genoa is a clean town for Italy; but the odours which pervade even the noblest palaces go far to spoil the pleasure of looking at the best Vandycks out of England. Vandyck lived and worked long in Genoa, and though scores, perhaps hundreds, of his pictures have gone away, there remain enough in various galleries to make a visit doubly interesting to an English lover of art. The great portrait-painter had not yet attained his highest skill; but you see here the prototypes of many a splendid picture of the islanders among whom his last years were passed. His subject-pictures are perhaps better here than in England. In the Red Palace, bequeathed to the city by the Duke of Galliera, we see the pale horse which in several later pictures bore the ill-fated Charles; but as yet, while he is ridden by the Marquis Brignole, he has not attained the freedom and life which, perhaps with the help of his fellow-pupil Snyders, Vandyck afterwards learned to give him. The dark soft eyes of the Genoese ladies, their cherry lips and tall figures, still live on the canvas; but it is to the portraits of children that the tourist turns with the greatest satisfaction. Children are happily cosmopolitan; the political and commercial, the social and moral struggles which have marked the features of the parents are invisible on their happy faces. Here is the youthful Tobit, with his dog and his fish, in a suit of blue velvet and fur. Here is a little gentleman whose father has brought him a monkey and a parrot from the Indies, and whose mother has endued him in a brocade from Trebizonde. Here two stately little ladies in point lace and stiff silk smile on their freer brothers, whose play they dare not join in their fine gowns. All show the painstaking care in grouping and the vivacity of expression upon which Vandyck improved when he came to paint the children of Charles I., and the gallant boys who were to die at Naseby and Marston Moor. Besides galleries, there are churches to be seen at Genoa, but the short winter's day begins to wane before we can tear ourselves from the pictures. More interesting than the cathedral, because less injured by the well-meant, if ill-directed, efforts of restorers, is the little church and cloister of St. Matthew. It is hardly mentioned by the books, but well repays a visit. When we enter the narrow square we are at once transported into the scenery of a mediæval drama. One side is occupied by the façade of the church, all written over with the epitaphs of the Dorias. The other three sides are formed by the black and white striped walls of lofty houses, whose upper windows are pointed, and whose string-courses are carved with heraldic lions and Paschal Lambs. The lower windows are of renaissance work; and, as the spot of blue above your head pales into the evening primrose, you observe at one corner a doorway which bears over the lintel a tablet recording in magniloquent Latin the gift of the house to Andrea Doria by his grateful fellow-citizens; but within, a barber is shaving a costermonger.

EVERY MAN HIS OWN GYMNASTIC MASTER.

THIS is an age of handbooks; a general proposition which is free from the rashness of most general propositions. If anybody wished to make acquaintance with the philosophy of Hegel, or to appreciate accurately the style of Pope, or to know what fashion Molière had of writing plays, there was once a time when he would set himself, with such assistance of men and books as he could get, to read Molière and Pope and Hegel. He now pays half-a-crown—or less if the discount system and his habits of payment will admit of it—and, having his handbook, is supposed to know all about the subject. Nor is the system by any means limited to books and authors. Indeed, to do justice where justice is due, the books and authors have rather borrowed it from other ingenuous arts than those of literature. Since Hoyle made his fortune as a teacher of whist a century ago and more, all sorts of games and exercises, bodily and mental, have had their handbooks, and it is to be presumed that these handbooks have been bought. The circumstances of the case make it difficult to collect statistics of the success which has attended this method of instruction. But the individual experience of most men probably includes one or two wholly futile attempts to avail themselves of it. There are perhaps few people who have not at some

time or other bought a handbook and learnt by practice how admirably a handbook can teach how not to do it. Perhaps there are not many things in which verbal description, even assisted by diagrams, is more powerless than in teaching the performance of bodily exercises. We shall not assert that no man ever taught himself to waltz, to fence, or to hang by his toes on a trapeze, by diligent and intelligent [illegible] of printed books. But we should very much like to [illegible] performance [illegible] who has done this, and we should wish him a very good-tempered partner, an exceedingly forbearing antagonist, and a floor thickly covered with the softest tan.

The latest manual of gymnastic instruction bears the *nom de plume* of Captain Crawley, who has fathered many such works in time past. The Captain is in many respects of the orthodox type of writers on sporting and kindred subjects. It has been noticed by the best critics that your sporting writer has an altogether phenomenal affection for the Latin Grammar, and for the small scraps of that classic language which may be found neatly arranged and translated at the end of some dictionaries. We do not, indeed, observe that Captain Crawley indulges in the *in medio tutissimus ibis* which is dearest of all to the sporting soul. But, on the other hand, he is extraordinarily fond of *verbum sap.*, which is wont to occur at the end of his chapters as a kind of colophon or tail-piece. Another delight of the sporting writer is general information, which he lavishes with a prodigality suggestive of vast learning. Captain Crawley here displays what has been strikingly called the reticence of power, rather showing us what he could do if he tried than putting forth all his skill. It would be too much to expect that in a treatise on gymnastics we could be delivered from the Greeks and Romans, who very promptly make their appearance. That among the latter people the office of gymnastic teacher was considered "of great honour and distinction" is something of a novelty to us; and it is surely hard on "the Teutonic races" to assert that they "derived their sports—leaping, wrestling, running, &c.," from the Greeks and Romans. A Teutonic race must surely have been a feeble thing if it needed to go to a Greek or a Roman to learn how to run and leap. The Captain, however, soon quits archæology, and only returns to it to inform us that the Knights of the Round Table were adepts in boxing—a statement for which, in some reading in the original histories of those worthies, we can remember but little authority. The Carlovingian Paladins had indeed a certain habit of *le boxe*, which, contrary to all the spirit of chivalry, they too often applied to the "clear visages" of their wives. But the posture of defence common with Lancelot and Percivale was, we think, somewhat different from that which Mr. Cribb and Mr. Bendigo were wont to assume. These, however, are merely the flowers of the Captain's book; its fruits are different. It purports to contain, and really does contain, the verbal description, assisted by numerous cuts, of a very large number of gymnastic feats with bars, parallel and single, with the wooden horse, the trapeze, the rings, and the other machinery of the gymnasium. It even contains a section on calisthenics, which we have read with some eagerness. Calisthenics had always previously been associated in our minds with the use of the globes, as a kind of mystery of the *Bona Dea*—to speak in appropriate sporting style—which it was not lawful for male beings to penetrate. It appears, however, from this work, that calisthenics are only gymnastic exercises without any apparatus, destined to produce graceful deportment. Some of the cuts represent a deportment which we cannot think graceful, but this is doubtless a matter of taste. The bulk of the Captain's book is devoted to more exalted deeds. He is much less parsimonious of appliances than some of his brother handbook writers. We recently saw a book on the same subject, of American origin, but, we think, republished in England, which unfolded a most ingenious scheme of apparatus for the development of muscle. The pupil was to buy a stout broomstick, to cut sockets for it in the door-posts of his bedroom, and there he was. It was impossible not to imagine the countenance of a British landlady when she discerned the use to which an active lodger desirous of a sound mind in a sound body had put her door-posts. The vision also of a house full of such athletic persons all contorting themselves in a sort of frame formed by the door-jambs—for the door would necessarily be open during the process—seemed to invite the meditative imagination. But this ingenious author was, if we recollect aright, really practical; and his descriptions were not only very minute, but were limited to such feats as an intelligent person with a broomstick and license to cut about his door might actually perform. Our Captain is, as we have said, a great deal more ambitious. It must, however, be acknowledged that, with all his ambition, he is a candid Captain. He informs his readers, with a very engaging frankness, though with some monotony, that "it is folly to suppose you can become an athlete by mere reading," that "it is absurd to think you can learn any mechanical art by mere reading," &c. We fully agree with him; but in this case he seems to be in something of the same dilemma that the Caliph Omar—may he be confounded for it—invented for the destruction of the Alexandrian Library. A manual of gymnastics alone is insufficient; with an instructor it is superfluous. What, then, is the good of such a manual? Perhaps this question is more strongly borne in upon us when we read the sections devoted to what may be called combative gymnastics—to wit, boxing and wrestling. The idea of pugilism with a manual is apparently self-contradictory, unless the pugilist has three hands and two pair of eyes. Nor is the case of wrestling much better. "When your antagonist advances his left leg to hank you, the best plan," we are told, "is to hipe him with the right thigh." Is it not pleasant to imagine the student [illegible] Are you going to hank me? and running immediately [illegible] in order to refresh his memory as to the thigh with which [illegible]. Would the banker spare to bank meanwhile? Perhaps, indeed, the real defence of handbooks [illegible] not teach much, they may at any rate create a [illegible] the subject. This would explain the cunning art of the teacher in mixing the wormwood of instruction—here is another classical allusion for Captain Crawley—with the honey of Greek and Roman archæology, the docile want of originality of the Teutonic races, and the pugilistic habits of the Knights of the Round Table.

There is one remark of the Captain's—it is another example of the frankness which, as we have already remarked, is so attractive in him—which strikes us as about the most valuable in the
He observes with some emphasis that, "unless the learner
real liking for the exercise, a natural aptitude for gymn
springy feet, capable hands, a quick eye, good nerve, a lithe body, and a brain apt not to be confused at difficulties, he had better confine himself to such simple, though excellent, means of exercise as running and walking." This is the remark of a sensible man who knows what he is talking about, and who is not beset with the delusion that there is nothing like leather. Some rivals of the Captain's have been wont to talk as if gymnastics were, or ought to be, part of the education and daily life of all men at all ages, no matter what may be their constitution or occupation. Schoolmasters and doctors know what not unfrequently comes of the practical carrying out of this principle. There is of course no doubt that, in almost any case, elementary gymnastic exercises do a vast amount of good. To the want of them is due the fact that so many men nowadays cannot make any unusual or special exertion of the muscles without discomfort, and sometimes something worse. But to be a gymnast in Captain Crawley's sense is nearly as hard as to be a Christian in Mr. Browning's. It is certainly not every man who has the formidable string of qualifications just given; and if any one has them not it is improbable that he will ever succeed in swinging by the back of his neck on a trapeze, and decidedly preferable that he should not attempt to do so. He may still, without attaining this heroic virtue, walk his thirty or thirty-five miles a day comfortably, vault or jump any reasonable obstacle that comes in his way, and perform any other moderate athletic feats which are likely to present themselves in the life of a gentleman as distinguished from that of an acrobat. Rowing will develop the muscles of his legs and arms as well as, and far more pleasantly than, any other exercise; and he will doubtless be none the worse for a little fencing and boxing, learnt, not on the "manual" principles (which are also those of M. Jourdain), but by actual teaching and practice. All these exercises correspond more or less directly with the natural movements and practices of ordinary life. The trapeze and the flying rings correspond perhaps with the circumstances of a certain kind of life, but it is that of a monkey, and not that of a man. It is satisfactory, by the way, to perceive that this principle has now pretty thoroughly made its way in one branch of athletics, or preparation for athletics, where it used to be signally violated. Captain Crawley's remarks on training are not many, but they are sound. The old miseries of training are now pretty generally discarded, and it is recognized that a man undergoing that process should practically live in no other way than that in which it would be good for men to live at all times. In old days the principles of the process were not unlike that which, as a sarcastic Scotchman once remarked, accounts for the inability of the feeble and luxurious Southron to withstand Caledonian good cheer. "You eat too much and you don't drink enough." The same might certainly be said of men in training in the days when a horrified Oxford scout once discovered fourteen chop bones on the breakfast plates of three candidates for Putney, and when liquids were measured out with as much parsimony as if they were poisons. We have changed all that, and there is no doubt that the change is for the better.

AN ASCENT OF THE GRAND PIC DE LA MEIJE.

AN expedition of no common interest is recorded in the lately published number of that well-edited but somewhat austere publication, the *Alpine Journal*. For some time past three energetic members of the Alpine Club, who seem to view with equal contempt hackneyed walks on mountains and those absurd climbs which are known by the name of new routes, have been making a series of ascents in Dauphiné, without the aid of guides, trusting entirely to their own skill and knowledge. Such ascents, as we need hardly say, have not infrequently been made before. So long ago as 1855 the late Mr. Charles Hudson and four other English travellers made their way up Mont Blanc by the old St. Gervais route without guides, their only paid assistants being porters, whom they dismissed at the top of the Aiguille du Goûté. Since that time other bold climbers who were willing to dispense with the valuable but expensive aid of guides have appeared, and not very long ago a striking feat was performed by some amateurs of this order, who reached the summit of the Matterhorn. Even this exploit has now, how-

ever been surpassed, by Messrs. C. and L. Pilkington and Mr. F. Gardiner, the gentlemen to whom we have referred. After making without guides a series of arduous [illegible], including that of the formidable Pic des Ecrins, [illegible] travellers crowned their achievements last summer [illegible]ding the Grand Pic de la Meije, thought by [illegible] most difficult [illegible] in the Alps, with the one exception of the yet unascended Aiguille du Géant. It may not impossibly astonish some readers [illegible] the Dauphiné mountain spoken of [illegible] Matterhorn, inasmuch as that mountain is very commonly [illegible] to be more severe than any other. The opinion is not altogether incorrect, for probably, if the southern side of the Matterhorn had not been made comparatively easy by the ropes which are fixed at the difficult places, it would be as hard as the face of the Grand Pic de la Meije, or as any other series of crags that can be scaled by man. It was, however, by the less arduous northern side, on the only bad part of which a chain has been placed, that the amateurs just mentioned ascended, and their expedition, fine as it was, cannot [illegible] compared with that made on the French peak. To the [illegible]ster of the latter mountain, indeed, the conqueror of the [Mat]terhorn himself has borne witness. "One can scarcely speak in exaggerated terms," says Mr. Whymper, "of its jagged ridges, torrential glaciers, and tremendous precipices." Other travellers of great Alpine experience have been equally struck by this singular peak, the ascent of which without guides is certainly the most remarkable exploit that has yet been achieved by amateurs in the Alps.

We have said the ascent, but we should more properly have said the descent, for though the climb to the top was in parts very difficult, it was neither so trying nor so dangerous as the return thence; and it seems clear that, if the travellers had not been men of steady nerve and great skill, their chance of getting safe back to the valley would have been about on a par with that of arriving punctually by a London and South-Western train. Before, however, speaking of the incidents of their expedition, it would perhaps be well to give a brief account of the mountain, and to show how serious an undertaking its ascent has been thought by those most qualified to judge. The Meije is a very precipitous ridge, running east and west and crowned by four peaks—the Pavé, the Pic Oriental, the Pic Central, and the Grand Pic de la Meije—the two latter, which are the loftiest, being respectively 13,026 and 13,081 feet high. The Pic Central was climbed as long ago as 1870; but the Grand Pic—a far bolder and more striking pinnacle—seemed so hopeless that it daunted mountaineers, even at a time when nearly all the summits once deemed inaccessible had been reached. Some efforts to get to it from the Pic Central were made; but there appears to have been no attempt to ascend it by any other route until 1875, when it was tried from the western *arête* and from the south. A series of determined assaults followed, but it was not till August 1877 that all the difficulties of the mountain were overcome. Most first ascents in the Alps have been made by Englishmen; but in this case it was a member of the French Alpine Club, M. Boileau de Castelnau, who was victorious. In 1878 the summit was attained by Mr. Coolidge, a well-known member of the Alpine Club, and also by two French gentlemen. A year after the latter ascent Mr. Pilkington and his comrades made their very remarkable expedition. All these ascents, it should be observed, were made by the southern face of the mountain.

It may easily be imagined that the cliffs of this southern face, which for so long a time seemed hopeless even to the most confident mountain-climbers, were formidable in the extreme; and from the account which Mr. Coolidge has published of his expedition it seems that the difficulties were not only very great, but were in one respect different from those usually found on mountains, as the trouble of getting down was out of all proportion to that of getting up. Of many *mauvais pas*, the worst was a very steep rock face which had to be climbed. The ascent of this, according to Mr. Coolidge, surpassed in continuous difficulty any other with which he was acquainted; but apparently no one part of it was worse than other places he had crossed. The descent of the cliffs, however, appears to have been trying and dangerous in the highest degree. It must almost have seemed to Mr. Coolidge as if he was going to attain a renown like that of Peter Botte. He says:—"The descent of this wall will always remain in my mind as the most arduous and terrible piece of climbing that it has ever fallen to my lot to perform. When I say this, I am speaking deliberately, and in the conviction that I am not exaggerating the impression it made on me." Mr. Coolidge, who is a most experienced climber, had with him the two Almers, the elder of whom is, as we need hardly say, the best guide in the Alps. If, notwithstanding his aid, coming down the wall was such serious work, how appalling must it have been for unaided amateurs. It may perhaps be said that they would have done better if they had realized more fully how appalling one part of their undertaking was, and had not attempted an expedition in which success would bring nothing at all commensurate with the risk which was necessarily incurred. Such a censure would be by no means without justice; but before considering it we should wish to describe the achievement of the three travellers, who, if foolhardy in some respects, certainly showed remarkable steadiness and skill.

The way to the Grand Pic de la Meije lies first up a great buttress on the southern side of the mountain some distance to the west of the peak itself. Mr. Pilkington and his comrades climbed a part of this buttress a few days before their ascent, and deposited their spare ropes and some provisions at a considerable height. Subsequently, on July 24th, they bivouacked on the Glacier des Etançons, and started at midnight for the formidable ascent, of which, as is often the case with very difficult [illegible], the [illegible] was by no means trying. The buttress was scaled, [illegible] trouble apparently, and at an early hour in the morning the travellers were at the foot of the great rock [illegible] has been [illegible] the only possible way to the summit [illegible] wall, and [illegible] a huge patch of snow called the Glacier Carré, to the east of which the final peak rises. Coming to the end, then, of the easy part of their work, the travellers had to scale this wall, part of which appears to be as nearly vertical as anything which human beings may hope to climb can be. They were able at first to proceed along a ledge trending towards the west; but their progress was soon stopped by ice, and they had to worm themselves up some smooth slabs, and then, after scaling treacherous rocks, to make their way up what Mr. Pilkington, with no exaggeration apparently, calls a precipice. "On removing the loose stones," he says, "the slightest back-handed jerk, just enough to miss the heads of the men behind, sent them clear into the air; they never touched anything after leaving the hand, and disappeared with an unpleasant hum on the Glacier des Etançons, 1,800 feet below." Undismayed by the chance—not inconsiderable, seemingly—of disappearing with an unpleasant hum themselves, the climbers struggled upwards over these thoughtlessly arranged rocks, and, after spending two hours and a half in surmounting the last hundred feet, found themselves at the corner of the Glacier Carré. The passage over this was easy; but the climb up the final peak which followed it appears to have been decidedly arduous in parts, owing to the amount of ice on the mountain. There were, however, no obstacles likely to stop such energetic climbers as Mr. Pilkington and his comrades, and at half-past two they stood on the summit of the grand Pic de la Meije.

Mr. Pilkington speaks as if they had been very happy there, but it is difficult to avoid the conviction that they must have been haunted by a hideous doubt. Climbers on the tops of high mountains have often had misgivings as to getting down again; but in this case the misgivings must have been very serious indeed. To the chance of being smashed into little bits, or of starving quietly on the peak in consequence of not being able to descend it, the travellers were doubtless as indifferent as the Frenchman of romance is to the risks of a duel; but the possibility of a much graver evil must have struck them. They must have felt that, in the event of their being killed, their ascent might be denied by calumniators, and that, owing to posthumous detraction, they would never be credited with having reached the top of the Meije. A more terrible thought could not suggest itself to the mind of an Alpine climber, and these gentlemen had therefore really a strong incentive to avoid a smash, and they had also valid reasons for wishing that they might not be frozen to death, of which there seemed to be some slight chance, as they had to sleep on the snow of the Glacier Carré, with no better protection than that afforded by a thin india-rubber bag. They were none the worse, however, for their chilly night; and—not being Arctic explorers—thought but little of it. They were off as soon as they got thawed in the morning, and a short descent led them to the edge of the rocks which they had ascended with so much difficulty. To attempt to get down them without the aid of a rope to hold on by was apparently as hopeless as it would be to try to get down a brick wall; so a rope was fixed to a jagged tooth of rock, and, holding on to this and partly supported by another rope paid out from above, Mr. Gardiner and Mr. Lawrence Pilkington descended. For Mr. C. Pilkington the work was much more unpleasant, as he had to trust entirely to the fixed rope, and unfortunately the only possible landing place was not directly under the place where the rope was made fast, so that the force of gravity kept pulling Mr. Pilkington away from the right line. Once he found himself "sitting on a projecting rock, with nothing below it but air for at least a hundred feet." He succeeded in joining the other two, at last, however, and after some well-earned rest at a comparatively comfortable spot, the descent was continued. The difficulties which had to be encountered were not inconsiderable, but were small compared with that which had been overcome. Some delay was caused by one of those mistakes which are often made when the hardest part of the day's work is over, and by the state of the snow on a portion of the buttress; but the travellers got to the glacier in good time nevertheless, and were so little tired by their efforts that they were able, instead of sleeping at their bivouac, to walk down to the hamlet of La Bérarde. Whether, after taking their ease at Rodier's inn there, they issued forth to struggle with more precipices and *arêtes*, or whether, content with their very remarkable achievement, they went home, their history does not state.

That their exploit is more striking than anything else as yet done in the Alps by amateurs is indisputable; and, indeed, it is difficult to see how it can be surpassed, unless some members of the Alpine Club should succeed in getting up the Aiguille du Géant without guides, which, to say the least, does not seem likely. No one can read Mr. Pilkington's quietly written account without admiring the singular skill and steady nerve which the travellers showed in carrying out their arduous undertaking. Of course, however, the question which has already been suggested arises with regard to their expedition. Can it be worth while for any rational men to put themselves in such danger for the sake merely of reaching the top of a mountain? To this question we fear only

one answer can be returned. It can hardly be seriously maintained that any possible result which Mr. Pilkington and his comrades could achieve was proportionate to the risk they ran, and they certainly seem to have passed the line which separates bravery from foolhardiness. At the same time, we believe that most people will feel that, though such a seeking out of danger must be condemned, the condemnation with which it is visited is not a severe one. Englishmen have great tenderness for those errors which come from excess of pluck and energy; and, although the doings of Alpine climbers have provoked ridicule which has not always been undeserved, and have occasionally provoked indignant denunciation, some sympathy has generally been felt for their love for the most bold and masculine form of amusement, and some admiration for their courage and enterprise. While, therefore, it is impossible to deny that men who were willing to run great risk and felt a strong desire for dangerous adventure might have found something better to attempt than the ascent of a series of crags which had been thrice scaled before, it is equally impossible not to admire the courage and expertness which were shown on the Grand Pic de la Meije. Mr. Pilkington and his comrades have certainly proved in a very remarkable manner that amateurs may acquire high proficiency in mountain climbing, great skill in which has generally been thought to be beyond the reach of any save those who have been trained on hillside and glacier from their early youth. It is to be hoped, however, that their success may not lead to thoughtless imitation, and that those who envy their prowess will observe how well they had qualified themselves for their work. For any but highly-practised men to attempt to follow their footsteps would be about as wise as it would be for a six months' pupil in a riding-school to attempt a steeplechase, or for a man to try to handle an East-coast fishing smack on the strength of being acquainted with Henley Reach.

AN ITALIAN ON HIS TRAVELS.

SIGNOR DE AMICIS, one of the best-known and most popular, if not the most solid, Italian writers, whose very readable and pleasant work on Morocco we noticed last week, produced not long ago a book which, with his special authorization, Mme. Colomb has translated into French under the title *Souvenirs de Paris et de Londres*. Signor de Amicis, with all his literary cleverness and tact, is apt to take a superficial view of the men and manners of foreign climes with which he makes his countrymen acquainted, and for the most part what he says about Paris might have been readily foreseen. He felt himself bound, on the first day of his return to "beautiful Paris, evil-hearted Paris," to speak of "le cœur ardent de Paris, la grande route des triomphes mondains, le grand théâtre des ambitions et des débauches célèbres," and so on, by which he means, somewhat oddly, the Boulevard Montmartre. He bursts into exclamations of "Ah! Paris! Ville chère et maudite! sirène effrontée!" and when he has opened his heart in this manner he goes on to give a sketch which is not without picturesqueness of the latest Paris Exhibition. From this he passes on to write at great length of M. Victor Hugo, and what he says by way of literary judgment in this connexion may possibly have been new to Italian readers, but would certainly seem commonplace enough to English people who have any acquaintance with contemporary French literature. However, the somewhat tedious account which he gives of a personal interview with M. Hugo is not without a certain interest, the culminating point of which is found in its exquisitely *naïf* conclusion. He has dwelt upon the tolerably well-known fact that M. Hugo's surrounders address him as "Mon Maître," or even as "Grand Maître," and the awe which he believed them to feel was apparently communicated to his own soul. When to his "Adieu, cher monsieur," M. Hugo replied, "Non, pas d'adieu. Au revoir, n'est-ce pas?"—"Je sortis de là, ému, heureux, avec un peu de mélancolie, et si bouleversé que je me heurtai rudement contre un fauteuil."

On M. Zola, to whom also he paid a visit, Signor de Amicis makes some remarkable observations. M. Zola is, he says, in spite of all, a moral writer. "This one can affirm with conviction. Emile Zola is one of the most moral novelists of France, and it is indeed astonishing that any one can doubt this. . . . His novels, as he says himself, are *de la morale en action*. Their offensiveness reaches only the eyes and the ears. . . . It is a deep conviction which guides him and gives him his strength; he believes that a writer ought to speak and describe that which is real on every occasion, at every cost, whatever it may be, in its entirety, without disguise." One is reminded by this of an apt if unpolished remark of Voltaire's on the same subject. "In this matter he too has what Victor Hugo says Shakespeare has, *une sorte de parti pris gigantesque*. He adapts his faculties so well to this *parti pris* that *il finit par n'être plus qu'une production plutôt qu'une création*," whatever that may mean. "His is a talent which is tranquil, patient, methodical, which gives out no brilliant flashes (*vifs éclairs*), but which throws an equable light on all things from all points of view. He is bold, but prudent in his boldness, self-contained, aiming at no great heights, and never incurring a serious fall, advancing by slow degrees along a direct path to a clearly-seen goal."

Never, perhaps, was a more astounding literary judgment delivered; and there is no room left for surprise on reading afterwards that M. Zola's study is a kind of citadel, where he forgets the world and absorbs himself in "les graves jouissances de la recherche du vrai." Possibly Signor de Amicis's view of M. Zola may have been influenced by M. Zola's parting speech, "Je suis toujours très sensible aux poignées de main amicales qui me viennent des étrangers; mais ce n'est pas d'un étranger que me vient la vôtre; c'est de l'Italie, ma première patrie, où est né mon père." One can understand a graceful speech of this kind giving a kindly turn to the judgment of the person to whom it was addressed; but it does not account for Signor de Amicis's picking out for laudation precisely those qualities which M. Zola does not possess. It is the *vif éclair* which prevents even disgust from making one throw aside some of M. Zola's books after one has read a few pages. As for M. Zola's moral purpose and deliberate progress to a definite goal in the interests of morality, possibly M. Zola and Signor de Amicis believe in it.

Signor de Amicis's experiences of London were less pleasant, if not less interesting, than those which he went through in Paris. He arrived at his station in the dark, and he knew not a word of English; but he had provided himself with the name and address of a certain hotel, written down on a slip of paper. This he showed to a cabman, who paid no attention to it beyond making him a long speech in English. Signor de Amicis gave himself a safe pleasure by calling the cabman an opprobrious name in French or Italian, and went on his way on foot until he reached a hotel where was inscribed *On parle Français*. An ill-tempered woman, who was the landlady, received him, and called the waiter. It is, we believe, not uncommon for landladies on the Continent to call waiters. The waiter, "prononçant chaque mot français avec une contraction qui avait l'air d'un effort pour vomir," and looking at the traveller with that expression of patronage and defiance which Signor de Amicis thinks is peculiar to waiters, informed him that he could have a room, but that it would cost him five shillings. As the writer said this, he eyed Signor de Amicis suspiciously from head to foot. Our author admits that his appearance at this moment was calculated to raise suspicion. He felt himself, however, seized with a feeling of haughtiness worthy of a millionaire, and, throwing a sovereign on the table with a gesture which at the moment he thought might fitly illustrate a line of Dante's, he said, "Pay yourself!" The next morning a thing which strikes Signor de Amicis as singularly interesting befell him. He went out and looked at the Thames, and though he was looking at the Thames for the first time, he could think of nothing but a book which he had lent to a friend, and which had not been returned, of Queen Elizabeth, and of a portrait of Garrick. "Quels étranges tours," he says, "nous joue notre cerveau!" His brain did indeed treat him inconsiderately. He went out prepared to fall into the kind of meditation on the mighty river and city which he thought would befit the occasion, and his brain, scorning his preconceived ideas, would occupy itself with a missing volume of Voltaire. We have seen how Signor de Amicis was impressed with the "sirène effrontée," Paris; and we shall now see that his brain was not always refractory during his contemplation of London. "Who can tell," he says, "the myriad fugitive impressions that seize one who walks alone through a city like London? Admiration asserts itself spasmodically; but between the seizures one is oppressed with weariness of mind and body. A dozen times an hour one asks one's self, 'Am I amusing myself as a matter of fact? Is this all one gets by travelling?' Sometimes you are seized with a sudden dread of being attacked with sudden illness as you walk. . . . Sometimes you feel a sudden and unreasonable gaiety and benevolence; at others, a scowling look, a hasty answer from a stranger, change the current of your ideas, and make you see everything in an evil light," and so on.

On one occasion Signor de Amicis travelled in an omnibus, when he was at first somewhat shocked at the freedom with which people going in and out steadied themselves by resting on his shoulder. His native good humour, however, prevailed, and induced him to even offer his shoulder for this purpose when he had once ascertained the meaning of what was done. In this omnibus one not unamusing thing happened to him. A young man spoke to him in English. He replied in French, "Je ne comprends pas." The young man either did not hear, or thought it was a joke, and continued his speech. Signor de Amicis shook his head to indicate the uselessness of the proceeding, and it happened, seemingly, that the gesture fitted in with what the young man was saying, for he talked faster and with a more satisfied air than before. When at length he stopped, Signor de Amicis replied with a speech in choice Italian, of which the young man evidently understood not a word, but to which he not the less replied again in English; and so this odd conversation went on until the young man got out, when "nous nous séparâmes en nous serrant la main comme deux personnes qui se seraient trouvées complètement d'accord sur toutes les questions du jour."

One can understand that Signor de Amicis was a little confused by the vastness of London all the more readily after reading his account of what he calls "le plus joli déjeuner cosmopolite que j'eusse fait jusque-là." Going over St. Paul's, he fell in with five pleasant young men, one from Cologne, one from Manchester, one from Haarlem, one from Guadalaxara, and the fifth from Lyons. The six of them went to breakfast together. "Excepté l'Espagnol et un peu l'Italien, les autres étaient des éponges à bière; la table fut bientôt couverte de verres vides, et la conversation devint très animée." Before the eighth bottle

the affairs of Europe were amicably settled, and they began to discuss distinguished personages of every nationality. Then, as they became more familiar, every one began to speak of himself. "'Je suis négociant—moi journaliste—moi peintre—moi, j'ai quelque bien,' et l'on se demande son âge, et l'on se dit: 'Vous êtes un beau type allemand,' et 'vous êtes un beau type italien,' et chacun écoute la langue des autres; et de temps en temps une voix s'écrie, 'Mais on ne boit pas, ici!'" Then they all made arrangements to meet again at all kinds of places, at all kinds of times; and then Signor de Amicis prudently took the air on the deck of a steamboat which we are left to infer finally carried him to Antwerp.

SMALL INVESTMENTS IN THE PUBLIC FUNDS.

THE answer given by the Chancellor of the Exchequer on Monday evening to a question put by Mr. Fawcett leads us to hope that before long facilities will be afforded to the poorer portion of the saving classes for investment in Consols. Mr. Fawcett asked whether it is the intention of the Government during the present Session to introduce a measure having that object in view, and the Chancellor replied that the matter is under careful consideration, but that, for the present, he could say no more. The answer, it will be seen, is so vague that it commits Ministers to nothing. Yet, when a subject of this kind is taken into consideration, we may fairly assume that the purpose is to find means for carrying it into effect, and all who have given thought to the question are aware that there are no insuperable difficulties in the way of doing so. Still we are not sanguine enough to expect that, in a Session which has so early witnessed the tactics of obstruction brought into play, there is much chance of carrying a measure that is neither sensational nor affords promise of party advantage. But in any case it is a gain that the question has so far advanced as to be under serious consideration. Of the expediency of providing such facilities there is no room for doubt. At present a servant, workman, or other person of small means and thrifty habits has no perfectly secure investment open to him which yields a moderately reasonable interest. Such a person may join a Club, or a Benefit or Building society, or he may deposit in the Savings Bank, but that is really all. There are, no doubt, joint-stock Companies whose shares are of small amount, yet for some reason or other the classes of whom we speak do not put their money to any large extent in joint-stock enterprise. Now working-men's Clubs and Benefit and Building societies are excellent things in their way, and some of them are admirably managed, but a large number also are of doubtful repute. Too frequently in the case of Clubs the originally fair rules are so changed as to deprive the elder members of the advantages in expectation of which they had paid their subscriptions for a long series of years. And notoriously Benefit and Building societies are liable to be defrauded by dishonest secretaries and treasurers. Even the old Savings Banks are not safe against fraudulent trustees. And the Post Office Savings Banks, though the security they offer is complete, allow no more than 2½ per cent. per annum on deposits. It is, therefore, in the highest degree desirable to bring investment in Consols within the reach of the very humblest. It is true that the Bank of England opposes no difficulty in the way of small investment; but the machinery is wanting by which the poor can avail themselves of the opportunity offered them. A stockbroker would hardly care for the class of clients we are here speaking of; and, indeed, it would not be worth his while to lay himself out for their custom, since his commission would so add to the price of the stock as practically to render it prohibitory. It is like the law costs in buying a few acres of land. What is wanted, then, is a machinery, provided by Government, that shall buy and sell Consols in very small amounts, either free of charge, or at so low a rate as not to be felt even by the very poor.

As is well known, the French Government has provided such a machinery. Throughout the country the Receivers-General and their deputies undertake gratis to buy and sell Rentes in ever so small amounts for whosoever wishes to transact the business through them. How largely this machinery is resorted to is shown by the official statistics of the purchases and sales of Rentes through the Receivers-General from 1871 to 1879, both inclusive. In the earliest of these years, it will be recollected, the first of the great Indemnity Loans was brought out, a circumstance which lends special interest to the period we are dealing with. As was to be expected, there were few dealings in 1871—the year of the capitulation of Paris, the Communist insurrection, and general disorganisation. The purchases did not quite amount to 6 millions sterling. But immediately afterwards they increased largely, until in 1874 they reached the maximum, being almost 24 millions sterling. Then they began to decrease slowly, the amount last year being somewhat under 16 millions sterling. For the whole nine years the purchases exceeded the enormous sum of four milliards of francs; in round numbers they reached 163 millions sterling. The cause of this increase and subsequent decrease in the buying will be found in the price of Rentes. The terrible disasters endured by France, the bitterness of party spirit, the uncertainties of the political future, the vast new creation of Rentes in consequence of the war—all these depressed prices very greatly for some years after the establishment of peace; and this, as we have seen, brought in a rush of country buyers. On the Bourse there was a still greater rush. This eager buying, in conjunction with the rapid recovery of the country, raised prices, and then the small investors began to fall away. But the effect we are here tracing is still more clearly shown in the statistics of sales. In 1871 the sales through the Receivers-General were under 400,000*l.*; even in 1874 they scarcely exceeded 6 millions sterling; but they then rapidly increased, until in 1878 they were over 15 millions sterling. We thus see that these small investors act in precisely the same manner as their richer neighbours, buying in a cheap market and selling in a dear one. Deducting the aggregate sales during the nine years from the aggregate purchases, we get as the excess of the purchases 96½ millions sterling. In other words, the net purchases through the Receivers-General amounted to 96½ millions sterling, or to very nearly half the indemnity paid by France to Germany. It will be borne in mind that the transactions here recorded are in addition to those on the Paris and the Provincial Bourses, and in addition also to the orders sent up direct to the capital by country bankers and other large capitalists. It follows, therefore, that the net small investments in the French Rentes for the past nine years have averaged somewhat over 10½ millions sterling, while the gross small investments have averaged 18 millions sterling. We need hardly point out how powerfully this considerable addition to the demand for the public funds of France contributed to raise the credit of the State. Without reckoning the action of the Bourses, we have seen that in nine short years the small investors, who have not hitherto been thought worthy of consideration in this country, have in France absorbed nearly half of the new debt created to pay the indemnity to Germany, leaving little more than an equal amount to the classes which here we are accustomed to regard as alone the investing and speculating classes. It is safe to say, that but for this vast absorption, the Five per Cents. would not have been run up to 18 above par, in spite of their liability to conversion, nor would their present quotation be so high. And of what political importance this high quotation is, the history of France during these nine years has abundantly illustrated. Another point to be noted is that the re-purchase of the great indemnity loans from foreign holders relieves France from the obligation to remit the interest abroad. Had she been unable to buy back the stock, in addition to the original loss of the capital of the indemnity she would every year have lost the interest on that portion of the loan held abroad. As it is, the whole of the loans being practically held in France, the payment of the interest is merely a transfer from the whole body of Frenchmen, under the name of taxpayers, to a smaller body of Frenchmen under the name of Rentiers. In our own case, it is true, there is little probability of any appreciable amount of Consols being held abroad. Still, even in our own case there are abundance of reasons which make it desirable that the home demand shall be as large as possible.

It may be objected that the money, which, under the plan we are recommending, would be directly invested in Consols, is already so invested in a more roundabout way. The funds of the Saving Banks, for example, are invested by the Commissioners for the Reduction of the National Debt in Terminable Annuities, and thus help to raise the credit of the State quite as effectually as if the depositors in the Savings Banks had themselves bought Consols. That is perfectly true, but it is not to the point. It assumes, in fact, that affording facilities to invest small sums in the Public Funds would not stimulate thrift, and would not attract any money from more questionable employment. Our contention, on the contrary, is that it would very greatly stimulate thrift, would draw out savings which are now hid away in old stockings, and, in short, would attract funds that now never reach the Commissioners for the Reduction of the National Debt. We by no means desire to interfere with the usefulness of the Savings Banks, or to deprive the Exchequer of the means of continuing the system of Terminable Annuities. But it is to take a very narrow view of human nature to conceive that every one is satisfied with the existing means of investment. We believe, on the contrary, that there is as much divergence of opinion on this as on most other matters. Some will no doubt, in any circumstances, go on as before, depositing in the Savings Banks, others will prefer the good fellowship of the Club, or the prospect of owning a house, while many more, not suited now, or suited but badly, will be attracted by the unquestionable security of Consols, and the ease with which they can be transferred. It should never be forgotten that the taste for saving, like most other tastes, grows with use, and therefore that he who would promote thrift should provide for diversities of judgment. From a political point of view, again, it is to be remembered that the influence of this country rests very largely upon the knowledge of her boundless wealth, and of the ease with which she could raise loan after loan of enormous amount. Roughly, her credit is measured in the general estimation by the price of Consols, and every considerable addition to the demand for these would confirm and deepen the impression abroad. But, in truth, it is not necessary to multiply arguments in support of the measure we are recommending. To all who are open to conviction the experience of France is conclusive in its favour.

REVIEWS.

MEMOIRS OF MADAME DE RÉMUSAT.*

OF the three volumes which are to contain the Memoirs of Mme. de Rémusat two have been published, and of these two one and a half have been translated into English. The translation, which is the joint work of Mrs. Cashel Hoey and Mr. Lillie, is unusually well done, being remarkably free from the stiffness and the foreign air which mark most translations. Nor can any one doubt that these memoirs deserved to be translated, and to be well translated, into English. They are entertaining; they bear on a subject of permanent interest—the character and habits of Napoleon; and they are so written as to persuade the reader that the writer is trying to tell the truth. The maiden name of Mme. de Rémusat was Claire de Vergennes, and she was born in 1780. When she was scarcely sixteen she married M. Augustin de Rémusat, who, after her father and grandfather had perished on the scaffold just before the fall of Robespierre, had become the confidential friend and adviser of her mother. The newly-married couple lived in great retirement, but soon after their union formed an acquaintance which was destined to shape the whole course of their future lives. The lady with whom they became intimate was no less a person than the celebrated, unhappy, foolish Joséphine. After a time, the young general who made Joséphine's fortune in making his own became First Consul; and, as his power grew greater, the First Consul thought he ought to have something of a Court. M. de Rémusat was appointed Prefect of the Palace in 1802, and shortly afterwards his wife became Lady-in-Waiting, a title soon changed into that of Lady of the Palace. They stayed on, getting grander and grander as the Consulate passed into the Empire and the Emperor became the master of so many kings. M. de Rémusat was Keeper of the Wardrobe, Chamberlain, and Supervisor of Theatres; and Mme. de Rémusat had even a larger share of the gorgeous finery of the Court than she desired. They saw the Court to its very inside; and Mme. de Rémusat was admitted to the most unreserved confidence of Joséphine, and subjected to the precarious familiarity of Bonaparte. She and her husband were, however, as she says, not good courtiers. They did not push enough, and others who pushed more pushed them aside. Without being dismissed, they retired under pressure into the background; and their original feelings of admiration and affection for Napoleon had so died away that they felt it to be at once inevitable and palatable that they themselves should be out of favour. When Joséphine finally accepted the divorce which had been long hanging over her, Mme. de Rémusat accompanied her into privacy, and remained with her until Joséphine died in 1814. Events had prepared the husband and wife to look on the restoration of the Bourbons, not as a good, but as the least bad, solution of the problems which France had to face; and they were so far compromised that when Napoleon returned from Elba, M. de Rémusat was ordered to leave Paris, and Mme. de Rémusat burnt the precious journal in which she had noted for years her experiences and recorded her observations. Three years later she attempted to restore from memory the substance of her memoirs, and it is the fruit of her recollections which is now, after the lapse of more than sixty years, given to the world. She died in 1821, just in time to escape seeing her husband superseded, on account of the too great liberality of his opinions, in the prefecture which he was then holding under the Bourbons.

Considering the circumstances under which they were written, and that they only embody reminiscences of what Mme. de Rémusat had seen and done many years before, these memoirs are singularly graphic and lifelike. The writer could not possibly write after she knew the end of Napoleon's history as she had written while this history was being worked out. Her presentiments of his fall were not invented; but presentiments that have been fulfilled naturally seem to have been vivid in proportion to their accuracy; and when the great man was safely caged at St. Helena, it was perhaps satisfactory to Mme. de Rémusat to feel that her discrimination had long before sufficed to show her that, if he was a great man, he was also a very little one. The general result of her reminiscences and reflections was that in Napoleon there were two men united. There was, as she puts it, one Napoleon gigantic rather than great, prompt in conception, prompt in execution, absorbed in one dominant thought, and capable of abstracting himself from all secondary impressions—a Napoleon who, if his aims had been higher, might have been the greatest man the world had ever seen, and who at any rate was the most extraordinary. Then there was the other Napoleon, attendant on the first like its bad conscience, the prey of anxiety, suspicion, and passions, distrusting everybody and everything, and especially the creatures whom he made his slaves and the frail institutions he invented. It was this second Napoleon whom she studied in the intimacy of Court life; and she found every day some new trait of character, some petty act of tyranny, some instance of coarse, brutal vulgarity which enabled her to realize how insufferable and odious Napoleon could be at his worst. Her first feelings had been those of unqualified admiration; but she was revolted by the murder of the Duke of Enghien, and, when her moral sympathies had once been shocked, she found in the miseries of her Court life innumerable opportunities of letting her hero descend in her esteem. She cannot be said to add much that is absolutely new to our knowledge of Napoleon; for those acquainted with his history were perfectly aware that, while he was a man of transcendent ability, he was also the greatest liar the world ever produced, odiously tyrannical, and repulsively coarse. Mme. de Rémusat does not give us a new picture of Napoleon, but merely furnishes us with a variety of new details with which to fill up familiar outlines. She carried her powers of feminine observation into the minutest particulars, and any one who cares to learn it may learn from her pages that Napoleon dirtied everything he put on, broke an infinity of nail scissors, and when he played at chess gained an easy victory by laying down the simple rule that he might move his pieces as he pleased. As a memoir-writer, too, Mme. de Rémusat had the advantage of living in an age entirely free from squeamishness, and no sentiments of prudery deterred her from sketching with much minuteness of detail the amours of Napoleon, or the indignation and final submission of Joséphine. These memoirs are never dull, while at the same time they are relieved from the appearance of malice or pettiness by the unmistakable wish of the author throughout to act as rightly as she dared and to think as nobly as she could, by her profound admiration for her reserved and conscientious husband, and by her genuine love for her country.

Napoleon in conversation with Mme. de Rémusat, or in her hearing, occasionally referred to his early life. The earliest reminiscence recorded is that of a prediction made by one of his uncles when he was a child, that he should govern the world, because he was an habitual liar. Napoleon related the anecdote with great complacency, and added "M. de Metternich approaches to being a statesman—he lies very well." In talking of his schooldays he said that he kept aloof from his schoolfellows, and that he had chosen a little corner where he would sit and dream at his ease. When his companions tried to usurp possession of this corner, he defended it with all his might, as he already knew by instinct that his will was to override that of others, and that what pleased him was to belong to him. When he entered on garrison life he took to novels, and allowed his imagination to wander over them, that he might afterwards measure his dreams by the compass of his reason. "I have always liked analysis," he went on to say, "and if I were to be seriously in love, I should analyse my love bit by bit." But, as Mme. de Rémusat contends, he never was in love, and was determined never to let passion subjugate him. He deputed Mme. de Rémusat to explain his views to Joséphine in one of her fits of jealousy. "She troubles herself," Napoleon wished her to know, "a great deal more than is necessary. Joséphine is always afraid that I shall fall seriously in love. Does she not know that I am not made for love? For what is love? A passion which sets all the universe on one side and on the other the beloved object. I certainly am not of a nature to give myself up to any such exclusive feeling. What, then, do these fancies, into which my affections do not enter, matter to her?" Of Joséphine Napoleon was really fond, unless she annoyed him by reminding him that she was his wife. On the eve of one of his battles he wrote to her in the most tender strain:—"Joséphine, you wept when I parted from you—you wept. At that thought all my being trembles. But be consoled, Würmser shall pay dearly for the tears I have seen you shed"; and next day Würmser was beaten. When, again, Lucien had positively refused to obey his brother in the matter of his marriage, Napoleon unbosomed himself to Joséphine. "It is hard," he said, "to find in one's own family such stubborn opposition to interests of such magnitude. Must I rely on myself alone? Well, I will suffice to myself; and you, Joséphine, you will be my comfort always." His favourite theme in discussing the past was the expedition to Egypt. He would speak with enthusiasm of the time when he appeared before the amazed Orientals like a new prophet. He prized the sway he exercised over people's imaginations more highly than any other, for it was the most complete of all. "In France," he said, "one must conquer everything at the point of demonstration. In Egypt we did not require our mathematics." But, if he occasionally gave the reins to his imagination, he aimed, with much success, at having no feelings. A great statesman or a great king, he said, in speaking of Frederick the Great, is a completely eccentric personage, who stands almost alone on his own side, with the world on the other. "The glass through which he looks is his own policy; his sole concern should be that it should neither magnify nor diminish." He described himself as having been much perturbed by the character of Augustus, as drawn by Corneille; for Augustus, who in other respects was admirably politic, was stated to have been guilty of clemency, and neither clemency nor cruelty has any proper place in the mind of a great man. He was much gratified, however, to find the famous "Soyons amis, Cinna," of Augustus so rendered by an ingenious actor as to give the impression of a deep and calculated perfidy, and this opened the eyes of Napoleon, who saw that he might still go on admiring Augustus. Of himself he thought that he had really risen to the highest height, that of standing outside morality altogether. When, towards the end of his time, Talleyrand suggested that the best thing he could do was to restore Ferdinand to the throne of Spain, and that he was still too strong for it to be regarded as a cowardly act, "A cowardly

Memoirs of Madame de Rémusat, 1802–1808. Published by her Grandson, M. Paul de Rémusat. Translated from the French by Mrs. Cashel Hoey and Mr. John Lillie. 2 vols. Vol. I. London: Sampson Low & Co. 1880.

act," replied Bonaparte; "what does that matter to me? Understand that I should not fail to commit one if it were useful to me. In reality there is nothing really noble or base in this world. Frankly, I am base, essentially base. I give you my word, I should feel no repugnance to commit what would be called by the world a dishonourable action." Nor was Napoleon under any illusion as to the mode in which the world which he so regarded regarded him. The truly happy man, he acknowledged, "is he who hides away from me in the country, and when I die the world will utter a great 'ouf!'"

Mme. de Rémusat was able to call to mind numerous examples of Napoleon's absence of feeling, or of his complete suppression of feeling if he had any. He seemed as fond of the little son of Louis, whom he destined to be his heir, as he ever was of any one; but in 1807 the child died, and when the news of his nephew's death reached Berlin, Bonaparte, who was about to appear in public, was so little affected that Talleyrand said, "You forget that a death has occurred in your family, and that you ought to look serious." "I do not amuse myself," replied Bonaparte, "by thinking of dead people." A story in the same vein is told of him and the little King of Rome. Talma was paying the Emperor a visit and the little boy was brought in. The Emperor took the child on his knees and began to slap him; then turning to Talma, he said, "Talma, tell me what I am doing." Talma did not know what to say. "You do not see it," continued the Emperor; "I am slapping a King." In his endeavours to impose himself on the world no artifices were too small for him. While he was First Consul he made a triumphal entry into Brussels. There was a State visit to the cathedral. The clergy left the altar and proceeded to the grand entrance to await the arrival of the First Consul. But the First Consul did not appear. The clergy were first astonished, then alarmed; but they presently perceived that he had stepped into the church and seated himself on the throne which was prepared for him. The fact was that, just as he was setting out, Bonaparte had been told that on a similar occasion Charles V. had preferred to enter the church by a little side-door which had thenceforward been called by his name, and he thought that an imitation of the manœuvre might lead to the door being called that of Charles V. and of Bonaparte. One of his favourite tricks was to disconcert people by pretending to forget them, just as at one time he took immense pains to captivate his soldiers by always managing to recollect them. He used to go round to ladies of his Court and enjoy the amusement of throwing them into confusion by asking them, "Pray, who are you?" Gentlemen who attended his receptions in a semi-official way were exposed to similar interrogations. Grétry, a member of the Institute, frequently attended the Sunday receptions, and the Emperor was always coming up to him and asking his name. One day Grétry, who was tired of this perpetual question, answered the Emperor's rudely uttered "And you, who are you?" by replying, "Sire, I am still Grétry" ("Sire, toujours Grétry"). Ever afterwards the Emperor recognized him perfectly. This petty pretension of forgetfulness was part of a system. As Mme. de Rémusat says, the aim of Napoleon was to isolate every one. No general or courtier or mistress was to be more than Napoleon made him or her, and no two people were to league together. His greatest troubles came from his own family, and he was distracted by the malice of his relations and the relations of his wife. Louis was especially odious to him, and Napoleon once remarked, "His feigned virtues give me almost as much trouble as Lucien's vices." Mme. de Rémusat was certainly not imposed on by the feigned virtues of Louis. She thoroughly detested him for his odious cruelty to Hortense, whom she to the end of her life believed to have been a model of immaculate virtue. M. Paul de Rémusat takes care by a judicious note that not even the reputation of the exceptional member of the Bonaparte family shall remain unscathed. And of all the family Mme. de Rémusat has drawn a series of portraits which, if the reproduction of disagreeable features is fidelity, must be pronounced to be admirably faithful. The best and certainly the most elaborate is the portrait of Joséphine herself. Mme. de Rémusat was a warm, but an impartial, friend. She seems to have really liked Joséphine, and as really to have despised her. She bears testimony to Joséphine's kindness of heart, even temper, and forgetfulness of injuries; but also paints her as fickle, easy to move and easy to appease, incapable of sustained attention or serious reflection. The genius of Napoleon overawed her; she criticized him only in what concerned herself personally, in everything else she respected what he called the force of his destiny. This was not good for her, for, as Mme. de Rémusat sums up her experience, "Napoleon exerted an evil influence over her, for he inspired her with a contempt for morality, with a large share of his own characteristic suspicions, and he taught her the art of lying, which they both practised with skill and effect."

The only man who was not overawed by Napoleon, who dared to judge and oppose him, and of whom he was afraid, was Talleyrand. M. and Mme. de Rémusat became, as time went on, intimate with Talleyrand, and the Memoirs are enriched with many anecdotes of Talleyrand, and records of his felicitous sayings. One of the first occasions on which Talleyrand and Bonaparte passed the limits of a casual acquaintance was when Bonaparte was on the point of setting out for Egypt. "I was in bed," said Talleyrand, "and Bonaparte came and sat by me. He told me all the dreams of his youthful imagination, and also of the difficulty in which he was placed by the want of money. 'Stay,' I said to him, 'open my desk; you will find there a hundred thousand francs belonging to me; repay me when you return.'" When Bonaparte became First Consul he repaid the money; but he could not believe that Talleyrand could have lent the money without some deep design, and, not being able to find the design out, he frankly asked Talleyrand what his motive had been. Talleyrand said he had no motive except the wish to aid a young man of promise. "In that case," said Bonaparte, "and if it was really done without any design, you acted the part of a dupe." In the same way, when Bonaparte had rejected, as above mentioned, Talleyrand's advice to restore Ferdinand, he ended by saying:—"All I have to do now is to consider whether your advice agrees with my present policy, and to try and find out besides," he added, with a Satanic smile, "whether you have not some private interest in urging me to take this step." Talleyrand, and Talleyrand alone, was, he thought, capable of outwitting him. If Talleyrand managed Napoleon, he let him know that he managed him. Napoleon once asked Talleyrand how he had so rapidly made his great fortune. "Nothing could be more simple," said Talleyrand; "I bought stock on the 17th Brumaire and I sold it again on the 19th." This was the adroitness of invention, but there was a higher kind of adroitness in his management of Napoleon on another occasion, at the time of the signature of the Treaty of Amiens. Talleyrand, after the treaty had been signed, went to see Napoleon, and for a whole hour remained transacting other business, and only at the end produced the treaty. "Why did you not tell me at once?" Napoleon asked. "Oh," replied Talleyrand, "because then you would not have listened to me on any other subject. When you are pleased you are not always pleasant." One or two specimens of Talleyrand's peculiar manner of saying good things, as if in the most natural and simple manner, may also be gathered from these volumes. Napoleon once said to him of Berthier, "He is so uninteresting that I do not know why I should care at all about him, and yet when I think of it I believe I really have some liking for him." "If you do care about him," replied Talleyrand, "do you know the reason why? It is because he believes in you." Many years after the death of Pichegru, just before Moreau's trial, Mme. de Rémusat asked Talleyrand what he thought of this death. "I think," Talleyrand answered, "that it happened very suddenly, and in the nick of time (bien subitement et bien à point)." The reader is indebted to the notes of M. Paul de Rémusat for recalling another saying of Talleyrand's which has the merit, if it be a merit, of being more epigrammatic. Talleyrand, when he quarrelled with Napoleon, was replaced as Minister of Foreign Affairs by Maret, afterwards created Duke of Bassano. Talleyrand had the greatest contempt for his successor, and thus summed up his opinion of him when giving his recollections of the period:—"I never knew but one man so stupid as the Duke of Bassano, he was M. Maret." What between the text and the notes, these volumes are eminently readable, and those who have gone as far as what has now been published will take them will concur in eagerly looking for the completion of the task which M. de Rémusat and his very efficient translators have set themselves.

TORRENS'S MARQUESS WELLESLEY.*

THE object Mr. Torrens had in view in writing this book is not very apparent. The intention indeed appears to be that an historic memoir of O'Connell should follow as a companion volume. "None seemed to me," says Mr. Torrens in his preface, "so characteristically representative of the two races long alienated by evil laws as those eminent men"—Wellesley and O'Connell to wit—"whose likenesses I have sought to trace in these volumes." From which it might be supposed that one of the two was an Englishman and the other an Irishman. As he goes on to observe, "A greater contrast cannot be conceived than that presented by their dissimilar ways of life, habits of thought, and impressive powers of expression. . . . . As they were seldom in contact or antagonism, I have had no temptation to resort to antithesis." That the two men are thus dissimilar appears to Mr. Torrens a reason for coupling them together in a book, from which very Hibernian way of putting it one might suppose that our author himself belongs to the "two races," which is his allusive mode of naming the Irish. Perhaps when he comes to his historic portrait of O'Connell Mr. Torrens may have something new to tell us. The present volume contains nothing that was not known before. The author makes references, indeed, here and there to original authorities; but he does not give the source from which he quotes, nor explain that the papers in question have already appeared in various published works. And when Mr. Torrens does give us anything original, he is almost always inaccurate. Thus, at p. 99 we are told that

> Mornington [on being made a member of the Board of Control—a sinecure office] found it less irksome to study reports and elaborate minutes, received with a broad joke and apparently never thought of more, than intermittently to give perfunctory attendance; and to admit to himself that he was fit for nothing but a sinecure, that was harder (*sic*) than any amount of work; and, when the permanent officials left his table bare day after day, he sent for books out of the limited library which then existed, and occasionally for copies of documents of importance from the archives, and from these he set about compiling, in the twilight of information concerning the East which Burke himself had found it so difficult to read by, a historical epitome of events from the times preceding the establishment of our fac-

* *The Marquess Wellesley; Architect of Empire: an Historic Portrait.* By W. M. Torrens, M.P. London: Chatto and Windus. 1880.

tories at Surat and Cossimbazar. Why he took so much trouble about it he probably could hardly have told at the time. But the irritable ennui within him wanted relief.

That Lord Mornington ever wrote a minute while at the Board of Control, still more that it was received with a broad joke, there is absolutely no evidence to show; and it is equally without proof that he attended the office day by day. The notion that one of the members of a sinecure Board should write minutes or give attendance day by day is sufficiently disposed of by the fact that the office was a sinecure, for Lord Mornington as for all the other members. Nor is it necessary to assume that Lord Mornington found the library too small for his purpose, since the epitome in question is in fact made from Orme's History; as for its having served as a relief from ennui, it consists of a few pages of foolscap, and might have been written in three or four days. When, therefore, Mr. Torrens says a little later that "Mornington had by diligence in his office at the Board of Control, and by thoughtful study of the history of our acquisitions in the East during the forty years that had elapsed since the battle of Plassey, qualified himself in a certain degree for administrative trust," we feel that he is talking nonsense. It is impossible to be diligent in the discharge of duties when there are no duties to discharge, and even if Lord Mornington had been thoughtfully studious, his superiors in the Government would have known and cared nothing about it. He was chosen to be Governor-General of India, not for having made an epitome of Orme's History, but because he was an Irish peer who had made a considerable figure in the House of Commons, and above all because he was an intimate friend of Pitt. It is equally a figure of speech to speak of the "huge East Indiaman" which conveyed Lord Mornington to India; the Indiamen of those days were vessels of about twelve hundred tons. Of the Governor-General after he had landed in India Mr. Torrens says:—"Three months of unquestioned power, with nothing but the sense of ultimate responsibility afar off, would have beguiled a nature less ambitious and idealizing into giving way to the intoxication of power. Mornington never grew bewildered or blinded by the dangerous potion." This is a singularly unhappy criticism. The same thing might be said with perfect truth of every other Governor-General. Sir John Shore, Lord Cornwallis, Lord Minto, Lord Hastings, Lord Amherst—none of these were bewildered or blinded by drinking of the dangerous potion for several years, not to say three months. On the other hand, it has generally been conceded of Lord Wellesley that the pride of power was exhibited by him in an unusual degree, and made a decided foible in an otherwise fine character. Sir James Mackintosh spoke of him as being a Sultanized Englishman. Certainly no Governor-General ever surrounded himself with so much state. Again, speaking of Lord Wellesley's correspondence with English friends, Mr. Torrens felicitously remarks:—

> How his susceptible, eager, inquisitive nature must have gorged (*sic*) such delicious packets[?] may be gathered from replies like the following [Letter to Lord Holland]:—"I request you to accept my acknowledgments for your kind note of April 24th, and for the *Anti Jacobin*, which has amused me greatly. . . . Let me express my gratitude, my dear Lord, for your kind attentions to Lady Mornington and to my children."

Mr. Torrens has indeed a curious incapacity to understand the meaning of language. When the Governor-General goes down to Madras to press on preparations for the war with Mysore, "the whole tone of administration"—in that Presidency—"was gradually changed. The coxcombry of clerkship was snubbed into diligence, and fine-gentleman airs had to give place to civility and regularity in office hours." To apply epithets which at one time might have been applicable to the English Treasury or Foreign Office to Madras office establishments; to speak of old Indians of the last century as giving themselves fine-gentleman airs, is of course ludicrously inappropriate, as is the reference to the supposed "habitual indifference of Anglo-Indian officials," who are much more obnoxious to a charge of over-earnestness. Mr. Torrens is not more happy in his descriptions of places; as when he says that, "in the comparative seclusion of Barrackpore . . . it was . . . pleasant [to the Governor-General] to hear the clank of his orderly's scabbard early and late in the courtyard below," and where he speaks of the waste of money on the "fantastic domes" of Government House at Calcutta. We are informed on unimpeachable authority that the bungalow occupied by the Governor-General at Barrackpore is a one-storied building with nothing below, not even a courtyard, where a scabbard could clank; while, if the photographs of the viceregal residence at Calcutta are to be trusted, it has only one dome, and that entirely remote from the fantastic in appearance. The account given of the College of Fort William, established by Lord Wellesley, shows that Mr. Torrens does not in the least understand what he is writing about; for he talks about "acolytes coming in readily, the young cadets showing up well in most of the schools." The students of the College were young civil servants and not cadets; and as to their coming in readily, as if there had been any option, one might as well talk about the prisoners in a gaol coming readily to the treadmill.

Inaccuracies of this sort are of course much more serious when they refer to larger matters. Thus, when Mr. Torrens says, of the war with Holkar, that Lake, "at the head of British dragoons and Sepoy horse, literally hunted Jeswunt Rao and his predatory host from point to point in the contested Doab, until at length he came up at night with them at Futtehghur, where they were surprised and routed with great loss," the use of the adjective "contested" gives an entirely wrong colour to the narrative. The possession of the Doab was never contested by Holkar in the proper sense of the term. The word "Sepoy," we may observe, invariably denotes a foot soldier; to talk about "Sepoy horse" is like talking about grenadier hussars. Again, "the Raja of Bhurtpore sided against us, and after repeated assaults his citadel remained impregnable. Delhi, on the other hand, was successfully defended." So one might write, the Prussians were defeated at Jena; on the other hand, a picket of French dragoons was surprised by some Brunswick hussars. The siege of Bhurtpore cost us the flower of our army, more men than all the previous war; the so-called successful defence of Delhi was the beating off of a predatory band of troopers, who hung about the place for two or three days, and then hurried off. From Mr. Torrens's way of stating the two cases no one would guess the intrinsic difference between them.

The part of the book which deals with Lord Wellesley's proceedings after his return from India, and his abortive attempts to form a Ministry, is somewhat clearer, because the subject-matter is more familiar to the general reader. The obscurity to be found here is due not to the facts, but to the author's curious way of stating them. Thus, Mr. Torrens quotes a letter from Sir Arthur Wellesley when made Chief Secretary for Ireland to Lord Buckingham, which ends thus:—

> I accepted my present office on condition that it should not prevent my being employed in my profession; and considering that Lord Wellesley had determined to support the new Government, and that they were likely to be placed in difficulties in Ireland, I did not think myself at liberty to decline it.

And he remarks on it:—"The friendship of his old chief remained unbroken; but Grenville could not so easily forgive, and the old class-fellows walked no more together." Who the old chief was was, for what person his friendship remained unbroken, and which were the old class-fellows who no longer walked together, the author has successfully rendered a mystery. Again:—

> Mr. Whitbread had actively supported Sheridan for Westminster against Paull, and on the hustings said that proceedings against Wellesley need not terminate though he were left without a seat in Parliament. This he construed into a pledge that he and his political friends would undertake the part of prosecutors. In a public letter on February 8, 1808, he enjoined Mr. Whitbread, whose talents and whose integrity he honoured, to redeem the implied pledge.

Notwithstanding this way of putting it, the reader must not suppose that the question was of either Sheridan or Lord Wellesley being left without a seat in Parliament, or that Mr. Whitbread addressed a letter to himself. Again:—

> Sidmouth had been Premier, like Grenville, and for a much longer time. Personally he had many friends, and he was the favourite of the King. He was willing to waive his claim to priority in favour of Wellesley, but with his old assailant Canning he repeatedly refused to sit in council. . . . Then there was Castlereagh, who did not pretend to the lead, but who had a devoted following in Parliament, without whom he was resolved that no Government should go on.

It is doubtful whether Mr. Torrens means us to understand that Sidmouth was determined no Government should go on without Castlereagh, or that Castlereagh was determined no Government should go on without his devoted following. Again, "the [Regency] restrictions expired in February 1812. On the 13th a letter to the Duke of York proposed to Grey a union of some of his friends with Ministers, suggesting thereby the omission of Grenville. Grey asked leave to confer with him." The friends in question, however, were not those of the Duke of York, as might be supposed, and it was not with the Duke, but Grenville, that Grey proposed to confer. We must conclude with another curious specimen of the author's criticism:—"The veteran Lake had tottered home to enjoy the evening sunshine of sympathy and homage from surrounding friends, but without having put by enough to support the advancement in the peerage which Wellesley insisted on as his due." Lord Lake was a veteran in one sense, having seen a great deal of service, although by no means an old man, as generals go, being in fact only a little over sixty; but as to his being a tottering one, the truth is that till just before his death he was as active and enduring as the youngest officer in the army. The notion that a viscount requires a larger income than a baron is one in keeping with many of the other reflections in this funny book.

SENIOR'S CONVERSATIONS.*

THE Journals now published are the last which Mr. Senior wrote. Their style and matter display his highest point of perfection in a branch of literature which he may almost be said to have invented. Only long practice combined with natural aptitude rendered it possible to report, in good English and with a substantial accuracy which is proved by internal evidence, long conversations conducted in French. In estimating the value of the statements and opinions which Mr. Senior has recorded it is necessary to remember that they were all intended for future publication. The interlocutors trusted, with good reason, in Mr. Senior's discretion that they would not be compromised with the Government or with contemporaries whom they might criticize;

---

* *Conversations with Distinguished Persons during the Second Empire, from* 1860 *to* 1863. By the late Nassau William Senior. Edited by his Daughter, M. C. Simpson. 2 vols. London: Hurst & Blackett. 1880.

but they k[illegible] speaking to a more or less remote [illegible], and that Mr. Senior's long head was, as Mrs. Thrale said of Boswell, equivalent to shorthand. The only doubt which could arise as to Mr. Senior's accuracy and fidelity might be suggested by the vigour, the fulness, and the occasional brilliancy of the different speakers. It seems too true that French conversation twenty years ago was much better than English conversation at the present day. The superiority cannot be attributed to the language, because Mr. Senior writes in thoroughly idiomatic English. In some instances he may perhaps have pruned away redundancies or added force to the original phrases; but his own style in speech or writing was rather solid and weighty than epigrammatic. No man was less inclined to antithesis or paradox, though he never hesitated to avow opinions which might be novel, and therefore unpopular. The merits of the French contributors to his collection are their own, and they are also responsible for an incidental defect which is common to them all. Some of their number discharge with credit that part of the prophetic function which consists in the enunciation of sound principles and suggestive warnings; but in the sense in which a prophet is so called because he predicts future events, the oracles are all equally deceptive. It is true that almost all Mr. Senior's Parisian friends, differing widely among themselves, agreed in hatred and professed contempt for *Celui-ci*, as they designated the Emperor. Some of them foretold his overthrow through the errors of his domestic administration, and many as the result of his foreign policy; but they were all equally certain that his power would be of short duration. A war with Prussia was a contingency which was often mentioned as probable, but it seems not to have occurred to any distinguished Frenchman that France might possibly be defeated. Again and again Mr. Senior was assured that the Church, the army, the middle class, and the workmen were bitterly hostile to the Empire; yet, seven years after the latest conversation recorded, seven millions of Frenchmen, forming an overwhelming majority of the total number of voters, supported the Emperor against all the sections of the Opposition. A ruinously unsuccessful war, which had been in its origin wholly unnecessary, fulfilled by an accident the vaticinations in which it had never been included as one of the probable causes of the fall of the Empire. Unfulfilled prophecies, though they may have been of little use when they were delivered, afterwards furnish valuable materials for the history of opinion. As in the former instalments of the Journals, Mrs. Simpson has edited the work with judgment and ability. The notes in which she gives biographical accounts of some of the less known personages of the dialogues are instructive and judiciously concise. Mr. Senior, though he is ordinarily content to leave his interlocutors to speak, takes in these volumes a less infrequent part in the discussions, always representing, where it was often wanted, the element of sceptical good sense; yet he seldom intervenes except for the purpose of eliciting explanations or of recalling attention to matters which had been overlooked. Having proposed to himself a definite object, he adhered to his plan with a self-denying and artistic consistency. Few writers of equal ability and accomplishment would be content to efface themselves so habitually, with the result of preserving a dramatic unity of design.

In 1860 Mr. Senior found that French society almost unanimously disapproved of the aid which Napoleon III. had given to the cause of Italian unity. General Changarnier accused him of having exhibited personal cowardice at Magenta and Solferino; but the real ground of dissatisfaction with the war was the annexation of Lombardy, and afterwards of the Duchies, to Piedmont. During 1860 Garibaldi added Naples and Sicily to the Italian Kingdom, and in the autumn of the same year the defeat of Lamoricière's Papal army at Castel Fidardo gave Victor Emmanuel possession of the Legations. Mr. Senior's friends frequently assured him that Garibaldi would attack the Austrian possessions in Venetia, and be beaten, with the result of compelling France once more to come to the assistance of Italy. If Prussia supported Austria, the French Emperor would undertake the conquest of the Rhenish provinces; and a campaign on the Rhine might lead to war with England, and perhaps to ulterior consequences, which happily never occurred. "If," said M. de Corcelles, "Garibaldi is beaten, Louis Napoleon must rescue him, and then we shall have a German war. We shall beat the Germans at first—we always do so—will you permit us to reap the fruits of victory?" The same orthodox and intelligent statesman believed "that the only bond among the Italians is war; that peace, instead of a cement, would become a solvent; that left to themselves they would crumble into dust." On the opposite assumption that Italy remained united and monarchical, M. de Corcelles felt "that not merely Louis Napoleon, but, what is more important, France, would have a right to ask for an extension of territory. She might ask for it on the south, on the west, or to the north. She might take Belgium and the Rhine, or Catalonia, or the Riviera and Genoa." The utterly unscrupulous doctrines of virtuous and constitutional politicians furnish a kind of excuse for the less predatory ambition of Napoleon III. Some weight must be attached to the general consent of well-informed Frenchmen in attributing to the Emperor a want of definite theory and purpose. It was believed that his enterprise in 1859 had been in some degree caused by his fear of assassination after the attempt of Orsini. His unfriendly critics generally thought that, although he might entertain vague designs of aggression, his indolence and love of pleasure would prevent him from following any steady and active policy. Some of them maintained that he could not afford to remain for five years at peace; yet it was admitted, not only that the mass of the people were dazzled by his success, but that they heartily sympathized with the cause of Italian unity. With the exception of the Emperor, the only person in high position who took a wise and generous view of the Italian question was Prince Napoleon, who himself had few friends. There appears to have been no foundation for the rumour that he was a candidate for the throne of Naples. The occasional encouragement which the Emperor afforded to a pretender was given to the Murat family. Mr. Senior was sometimes told that England had designs on Sicily, and that Garibaldi's expedition had been supported by English gold. He was probably not believed when he answered that there was no secret service money applicable to such a purpose, and that England wanted nothing from Sicily except oranges and sulphur. He sums up with quiet humour the attacks on England with which M. de Circourt greeted him on his next visit to Paris in 1861:—

> We were wicked for not stopping the war with Austria; we were wicked for not forcing Louis Napoleon to force Victor Emmanuel to observe the peace of Zürich; we were wicked for sending Garibaldi to Naples; we were wicked for sending the French fleet from Gaeta; we were wicked for allowing Prussia to attack Denmark. In short, it is in our power to keep the whole world quiet; it is our fault that it is in an uproar; and we shall be punished by seeing the French flag flying from Mayence to Antwerp, the Greek flag at Corfu, and the green flag in Dublin. Our French friends seemed to think this all very friendly and very wise.

In 1862 and 1863 the popularity of the Emperor had declined, and politicians of the higher classes were more than ever confident of his early overthrow. The restrictions on freedom of debate had been relaxed; and though the Opposition only consisted of five members, public criticism was soon found to be incompatible with absolute power. Thiers, who at this time had not returned to public life, foretold with unusual prescience the effect of a small admixture of liberty in ultimately destroying the fabric of despotism. There is reason to believe that the Emperor himself was aware of the danger of concessions which he nevertheless made in the hope of prolonging under new conditions the existence of his dynasty. The first Napoleon had foreseen that his successor must submit to constitutional restraints which he utterly repudiated for himself. The change in the character of the Second Empire began after the birth of the Prince Imperial, to whom his father was passionately devoted. But for the madness of the German war, it is not impossible that he might have bequeathed to him a constitutional throne. The unemployed statesmen who confided to M. Thiers their ingenious speculations on public affairs for the most part shared the prejudice against the Treaty of Commerce which had probably alienated from the Emperor the goodwill of the traders and artisans. Thiers was content to stigmatize as obvious folly the instalment of Free-trade which no other French ruler has had the sagacity or the courage to imitate or to extend. The Mexican expedition had not at the date of these conversations reached its disastrous close; but it was justly regarded as a rash and wanton expenditure of French resources for the benefit of a foreign and remote country. In 1862 and 1863 the cause of the Mexican failure was not foreseen in England or France, and scarcely in the United States. The establishment of the independence of the Confederacy was regarded as certain; and even Mr. Dayton, the American Minister, believed that the Union could only be re-established by the aid of an imaginary Southern party which would come forward in the event of Northern success. Both Mr. Senior and his friends repeatedly express their surprise at the folly of the Federal Government in offering reiterated affronts to England. It was not unreasonably inferred that there was an intention of provoking a rupture with England, for the purpose of excusing unavoidable defeat in the attempt to reconquer the South. At Lord Cowley's Mr. Senior once met Mr. Dayton, and Mr. Corbyn, who was a Confederate. "If you had been really neutral," said Dayton, "and had not raised the rebel provinces into a nation by allowing them belligerent rights, we should have suppressed the rebellion in three months." "If you had been really neutral," said Corbyn, "and had not supplied the Federals with arms and ammunition, they would have given up in three months." In this and in other respects it is interesting to recall the forgotten memories of seventeen or eighteen years ago. In answer to an inquiry by M. de Montalembert, Mr. Senior told him that English politics were tranquil, and that no one wished to disturb Lord Palmerston. "Does no one," said Montalembert, "care for reform?" "No one," was the reply, "except to detest it." It is doubtful whether there had been a general change of opinion when, three or four years afterwards, both parties successively promoted comprehensive measures of reform. The predictions of 1860 will probably in the last years of the century have been not less completely falsified by experience. Englishmen are perhaps less confident in their anticipations than Frenchmen, and it is possible that they may be more prescient of their own future. Few of them will rival the lucid force and neatness of the Orleanists and Republicans of 1860. Many readers may not unreasonably prefer the dramatic or literary merit of Mr. Senior's reported conversations to their historical interest; but it is impossible to insert extracts of such length as to represent the spirit, the finish, and the variety of a book which is throughout entertaining and instructive.

THE SEAMY SIDE.*

THE clever authors of *Ready Money Mortiboy* and a number of subsequent novels have devised a singularly ingenious complication of events for the plot of their latest novel, which, besides the perception of character and the lightness and humour of writing that belong to most of their works, possesses a strong dramatic element. Events, some of which the experienced novel-reader expects, and for some of which he is entirely unprepared, are dovetailed into each other with singular neatness of construction, and would fall naturally enough into such a series of *tableaux* as is common to some kinds of French plays, or, with judicious management and compression, might afford an effective closing situation for each act of a play arranged in the more usual form of acts without *tableaux*. It is worth noting that the surprises of the story depend almost entirely on the workings of the character of one of its personages. The authors have disdained to perplex the reader as to the thing upon which the main action of the tale hinges—the supposed death of Mr. Anthony Hamblin, the rich and blameless merchant. We know from the first that, for reasons which seem sufficient to him, he has taken advantage of an ice accident on the Serpentine to disappear, leaving his unclaimed coat to create the impression that the bursting water has engulfed him. What we do not know is the fertility of resource of his brother Stephen, known as "Black Hamblin," which up to the last moment seems likely to enable him to carry out his villanous designs. That he will be thwarted finally may of course be taken for granted all through; but the knowledge that this must be so scarcely diminishes the interest with which one watches his doublings.

The novel opens with an annual gathering of the Hamblin family, at which the principal characters are the two brothers already spoken of, Alison, daughter to Anthony Hamblin, and Gilbert Yorke, a young barrister in love with Alison. The gaiety of the evening is disturbed so far as Anthony is concerned by the arrival of a certain Miss Rachel Nethersole, who asks for a private interview with him, and who is described by the footman who shows her in to his companions as "dressed in rusty black, with a shawl over her arm, and a white collar on. As for her face, it's like a door-scraper." To Mr. Hamblin's courteous speeches when he joins her in his study this woman replies, "I neither sit, nor break bread in this house of sin. I am here for a purpose. That despatched, I go as I came." Miss Nethersole goes on to remind Mr. Hamblin of certain events which happened twenty years before at Newbury, when two brothers, "out for some sort of godless holiday," made the acquaintance of two maiden ladies, with one of whom they both fell in love. "The elder stated his case to me." "'Clumsily,' said Anthony, 'so that you believed I was making love to you. When you found out your mistake, you took your'— revenge he was going to say, but he altered the word —'your own course.'" Presently, Miss Nethersole goes on to say, the younger sister disappeared, and sent a letter to the elder saying she was happy with her husband, giving her address, and begging for forgiveness. Miss Nethersole replied by saying that she would never see her again, but would allow her one hundred and fifty pounds a year, to be drawn for on the 1st of January. "For eight years," says Miss Nethersole, "I continued to receive the draft for a hundred and fifty pounds and to honour it":—

Mr. Hamblin started in his chair and sat bolt upright.
"For how long?" he cried.
"For eight years. Ah, you know now why I am here!"
"I know now?" he repeated, as if incredulous.
"You pretend astonishment? That is because you have been found out. Surely I am but an instrument. The judgments are slow, but they are very sure."
Mr. Hamblin sank back in his chair and grasped the arms as if he wanted physical as well as moral support. "Eight years!" he gasped.
"You know what it means. Come, Mr. Hamblin, have the courage to tell me what that means."
"It means," he said, with white lips—"it means—forgery."
"Forgery," she repeated, with manifest enjoyment. "That is exactly what it means. I kept all those drafts, never thinking what might happen. When the ninth first of January came and brought no draft, I knew that my sister was dead. I had the blinds down and went into mourning. But last week I made a discovery. I found out that my sister had been dead six years before the last of those drafts was sent me."
Mr. Hamblin was silent.

Here we have a pretty enough beginning of a mystery. Miss Nethersole tells Anthony that he will be arrested in two days' time. "Think," she says, "of what you have before you; years in a convict prison; years in convict garb, on convict's fare, doing convict's work. And when you come out again, not a man in all the world to take you by the hand and call you friend! Do you tremble?" "He certainly did not. His face was pained, but not terrified. His look was troubled, but not with fear." He replies to Miss Nethersole that, if she executes her threat, her deed will recoil on her own head; and he implores her to destroy the forgeries, in which case he will explain all to her. Now here is what may perhaps fairly be called a flaw, if a slight one, in the construction of the story. There seems no sufficient reason for Hamblin's not revealing the truth to Miss Nethersole at once, instead of giving her a night to think over what he has said, which it must be owned is vague enough, and hardly calculated to carry conviction with it. However, novelists must no doubt be allowed a certain license in matters of this kind; and, if what happens in this scene is improbable, the improbability is at least not glaring. When Miss Nethersole, still firm in her belief that she is "an Instrument" for the punishment of the wicked merchant, goes away, she leaves with Hamblin a journal of her sister's, headed "The Journal of a Deserted Wife"; and, when the door has closed upon his odious visitor, Anthony says, with a sigh, "Poor Alison! Poor child! Must she then learn all?"

A certain proportion of readers will probably guess, at least after this interview, why it is that Anthony is more pained than terrified at Miss Nethersole's threats, and why he makes this remark concerning Alison. But as this happens in the third chapter of the first volume, it is of course only the beginning of the complications, the interest of which may be said never to flag, diversified as it aptly is with exceedingly lively sketches of strange characters and scenes.

One of the best hit-off characters is a certain Mr. Alderney Codd, a cousin of the Hamblins, in whom the faculty of hoping for fabulous wealth, which is sometimes found allied with hopeless impecuniosity, is treated with singular freshness. His sole source of income is a lay fellowship at St. Alphege's, Cambridge, which provides "an annual income for a man who, but for this provision, might have done something useful in the world. It is said that the moiety of the fellowship is retained by a certain firm of lawyers, and distributed annually among a small band of once confiding persons who have with one consent removed their confidence from Mr. Alderney Codd. He is the only member of the family who retains a kindly regard for that dubious sheep of the flock, Stephen." The description which comes later on of the tavern which is the favourite haunt of Alderney and of those like unto him, of the schemes which are discussed, and the talk which goes on there, is admirable. The character of Alison, who of course is of the greatest importance to the success of the book, strikes us as being very happily drawn. There is one scene between her and another character, a certain J. Bunter Baker, who is equally well drawn in all his native repulsiveness, which is so good that at the risk of making too long an extract we must quote it. This offensive young man is charged with a mission from the villanous Stephen, and, having seen Alison once before and been greatly astonished by her beauty and charm, has made up his mind to propose to her. On his way he encourages himself "by little exhortations, such as 'Go in and win, J. Double B. . . . Don't be afraid—she is but a woman. All women are alike. You're not so bad-looking, my boy; you've got a manner of your own with them; you've got the dibs; lots of girls would give their back-hair to get J. Double B.,'" and so on. When it comes to the point, however, his courage fails him, and he gets hot in the nose. He proposes, however, to call again:—

"I dare say [he says] you are pretty dull in this great house all by yourself. I could cheer you up, perhaps. Let me try, Miss Hamblin."
"Cheer her up?" She looked in amazement.
"I'm not a bad sort," he continued, warming to his work. "Come to know me, I am rather a good sort; at least they tell me so." He assumed a smile of satisfaction which made her shudder. "I may have my faults like most men. To begin with, I am not come, like you, of a great City House. I had my own business to make, and I've made it. The dibs are all of my own piling"—he thought this might sound vulgar—"and when I say 'dibs,' of course I mean the money; because I began as nothing but a clerk. You wouldn't think that, Miss Hamblin, would you, to look at me now? However, here I am—just as you see me. I've got a big business in tea; really a big business. There's my cab at the door for you to see the kind of hack I can afford—cheap at a hundred; and I'm quite a young man still, Miss Hamblin, and perhaps not so bad-looking as some—eh? Handsome Jack I have been called. We should run well together; and the long and the short is that, if you will let me pay my attentions to you, I am ready, money or no money."
Alison burst out laughing. She was so happy in her mind that she was amused rather than offended. The man's vulgarity, his impudence, his mock humility, his personal conceit, his intense belief in himself, amused her. She clapped her hands together as delighted as any school-girl at a joke, and burst into merry peals of laughter, which utterly routed and discomfited the wooer.
"Pay your attentions to me, Mr. Baker?" she cried: "oh, I am so sorry, because I am obliged to decline that delicate offer, so delicately made. Another girl, Mr. Baker, must have the happiness of receiving your attentions. And oh! I really feel what I am giving up: the big business in tea, and the cheap hack, and the—the dibs, and the young man, still young, called Handsome Jack. But there are many other girls, I am sure, who take a deep interest in tea, and expensive hacks, and dibs, and Handsome Jacks. You will have better luck with them, no doubt. Good-morning, Mr. Bunter Baker."
She laughed in his face, and left him there standing, hot and flushed. His knees felt shaky, and monosyllables trembled on his lips.

As he went away he became aware that there stood in the doorway an albino boy, who, on being perceived, exchanged his laughter for affected weeping, and exclaimed, "Oh! what a dreadful thing! She won't have him; she throws away his dibs and despises his tea; our full-flavoured at two-and-four, and our reely choice at three-and-two. She won't have him, even though they call him Handsome Jack!"

This boy, Nick Cridland by name, a nephew of Anthony Hamblin, is in one sense the triumph of the book. It cannot but be difficult to represent a boy, with a sharpness, it is true, beyond his years, but with a thorough boy's nature, and so represent him that he never seems either unnatural, tedious, or offensive. Messrs. Besant and Rice have succeeded in doing this, and they have given an element of novelty to their book by making young Nick the principal agent in bringing about the disentanglement of the troubles with which Anthony Hamblin's unfortunate but well-meant plan of passing for being dead surrounds Alison. The character of Stephen, the promoter of these troubles, is drawn

* *The Seamy Side.* A Story. By Walter Besant and James Rice, Authors of "The Golden Butterfly," &c. 3 vols. London: Chatto & Windus. 1880.

with audacity and success. The authors have not shrunk from showing us a man who has not one good quality left in his nature, and have yet made us believe that it is perfectly possible to meet with such a man any day. There is perhaps more thought in the treatment of his character than the authors have given to any previous creation of theirs.

We have purposely left untold all that happens after Hamblin's self-effacement, and readers of the book will probably be grateful to us for not spoiling their interest in it. *The Seamy Side* is one of the best, if not the best, of the authors' novels.

LEGEND OF THE BURMESE BUDDHA.*

THIS work, although it made its first appearance more than a quarter of a century ago, may be said to be new to the English public. It first came out in the *Journal of the Indian Archipelago*, a periodical of very limited circulation, and it has been twice reprinted in a collected form at Rangoon. Few copies of either edition reached Europe, and these were soon dispersed. The stock at Rangoon has been exhausted for some years, and a reprint in England comes very acceptably to those who have heard of the merits of the work but have not been able to procure it. Some few European scholars into whose hands the book had found its way have spoken of it in highly commendatory terms, and it has been freely used for more than one popular exposition of Buddhism. It is a curious fact that, although it is the work of a French prelate, it has been translated from English into French. The right reverend author has approached his work in the most enlightened and impartial spirit. He sets forth the virtues of Buddhism with candour, and censures its errors and deficiencies with a firm though gentle tone. The keynote to his treatment is found in the preface, where he says:—

> Though based upon capital and revolting errors, Buddhism teaches a surprising number of the finest precepts and purest moral truths. From the abyss of its almost unfathomable darkness it sends forth rays of the brightest hue.

The book has been derived entirely from Burmese sources—from "the religious books of the Burmans, and from frequent conversations on religion, during several years, with the best-informed among the laity and the religious," this last term being used here and throughout the book for *religieux*—a convenient French term for which we have no exact equivalent. A very considerable portion of the work is made up of translations from original authorities; others apparently consist of digests and compilations from various sources. It would have been well if the former had been marked as quotations, and the works specified. The words of an original authority must always have more weight than any summary, however carefully and conscientiously made.

Buddhism, as is well known, spreads over a vast part of Asia, and numbers its adherents by hundreds of millions. It has no Pope, no great central authority to keep the various branches in harmony; so the religion as professed and practised in different countries, though agreeing in the main principles, shows many and important divergences. The Buddhists of Nepaul, Tibet, and the North have been separated from their co-religionists in the South by the reconversion of India to Brahmanism. The canonical books of the North are chiefly written in Sanskrit, and have been made known by the labours of Brian Hodgson and other investigators. There are also many works in Tibetan. But the true scriptural language is Pali, the language of Buddha himself, and the language in which the sacred books of Ceylon are written. It is through the Pali that Buddhism has for the most part been made known to Europe. This religion cannot be written about or spoken of without a constant use of its technical terms, for which European languages afford no equivalents. These terms have become familiar to some extent in their Sanskrit forms, but they appear commonly in their legitimate Pali shapes. In fact, Buddhism has become known to Europe in a Pali dress, and confusion and difficulty will be obviated if that is retained. We have been led to this observation by the fact that in these volumes the familiar names and the technical terms of Buddhism are written according to Burmese orthography, and many of them appear in shapes which none but experts can identify. The author was quite justified in using these words, but he would have removed many a difficulty from the way of his readers, and have obviated much vexation, if he had supplied the Pali forms in brackets, in footnotes, or in a general table at the end. Few readers will find difficulty in identifying *Gaudama* with the Pali *Gotama*; they may recognize *Sakyamuni* in *Thakiamuni*, perhaps even *Suddhodana* in *Thoodaudana*. In such passages as "the *Thoots*, or instructions; the *Wini*, or discipline; and the *Abidama*, or metaphysics," the explanations may enable them to identify these words with *Suttas*, *Vinaya*, and *Abhidhamma*; but only the initiated will perceive that *dzedi* is *chetiya* (Sans. *chaitya*), *dzat* is *jataka*, *tsekiawaday* is *chakkavatti* (Sans. *chakravarti*), and *rathee* is *rikkhi* (Sans. *rishi*), that *Adzatathat* is *Ajatasatru*, and *Pimpathara* is *Bimbisara*. Corrupted forms like these abound, and will be the causes of much needless perplexity. Speaking on this subject, the Bishop says:—"The Burmese employ their common alphabetic characters for writing Pali words. The words, having to pass first through a Burmese ear, and next being expressed by Burmese letters, undergo great change. To such an extent does the metamorphosis reach that very often they are scarcely recognizable." The metamorphosis has been heightened in the work by the occasional use of French phonetics, and the result is that ordinary readers will find much difficulty in reading it and comparing it with such a work as Spence Hardy's Manual.

Burmese annals represent that Buddhism was introduced into Burma in the fourth century of our era; but some maintain that it spread thither long before that time, and it may well have done so. There is no conclusive evidence on the matter. But, whatever may have been the date of its introduction, there can be no doubt of the peculiar importance of the Burmese legends and records:—

> Owing to its geographical position, and perhaps also to political causes, Burma has ever remained out of the reach of Hindu influence, which in Nepaul has coloured Buddhism with Hindu myths, and habited it in gross forms of idolatry. In China, where there already subsisted at the time of the arrival of the preachers of the new doctrine the worship of heroes and ancestors, Buddhism, like an immense parasitic plant, extended itself all over the institutions which it covered rather than destroyed, allowing the ancient forms to subsist under the disguise it afforded them.

Other reasons may be found to account for the comparatively primitive state in which the Buddhism of Burma remains. The people of Burma have never shown any of that aptitude for metaphysical inquiries for which the Hindus have been distinguished. They have clung to the moral and human side of Buddhism without caring to enter deeply into its philosophical teachings. The same simple easy tone of mind has made them contented with the religion of common life; they have not felt the need of sacrifices and propitiatory offerings, so of priests in the true sense of the word they have none; and although it is a duty and a pleasure for them to minister to the wants of those who follow the religious life, these have never attained to anything like the ascendency which the Brahmans have established over the Hindus. The Burmese appear also to be deficient in imagination; they have but few aspirations for the beautiful and the spiritual, and they have no craving for the ritualistic and sensuous forms and ceremonials which have grown to such a height in the Buddhism of Tibet. For all these reasons they have retained a large share of the original simplicity of Buddhism, and their form of religion is consequently of very high interest.

This Legend of Buddha gives a complete history of the life of the great teacher, from his conception and birth to his death and accomplishment of the Nirvána. The whole is told in the most unaffected language, unadorned by flights of imagination or poetic fancy. Marvels and miracles there are, but these are of a prosaic and practical character, directed more to the enforcement or illustration of some particular doctrine than to captivate and allure the imagination. But the great teacher's intense love of humanity, and his compassion for the evils under which it suffers, pervade the whole. His struggles to obtain knowledge, the courage with which he grasped and held fast each new truth as he discerned it, and the unremitting thought with which he worked out his ends, deserve the respect and admiration of all thinking men. Those ends, it is true, reached something like atheism, something like annihilation—we say something like, because the Buddhists themselves as well as European philosophers are at variance as to the exact meaning of these terms; but however much the end may be pitied and deplored, the life of moral rectitude, the love, the tenderness, and the compassion by which that end was to be accomplished, are beyond all praise. No religion has approached so near to the Christian code of morality. This religion, says the venerable prelate, "is the greatest in its extent and diffusion, the most extraordinary and perfect in its fabric and constituent parts, and the wisest in its rules and prescriptions, that has ever existed either in ancient or modern times without the pale of Christianity."

The Bishop has illustrated and explained his text with many learned notes. We have observed some repetition in these, particularly in respect of those relating to the four great truths which constitute the "Law of the Wheel," which is "incessantly revolving upon itself, and successively presenting those four points to the attentive consideration and affectionate piety of the faithful." These four truths are:—1. Pain, or the miseries of life. 2. The causes of pain. 3. The destruction of pain. 4. The way leading to that destruction. The miseries of existence, bodily and mental, are but too well known to all men; the causes of them are to be found in the lusts and desires of life, which must be subdued by patient reflection and constant mortification. "He who has reached this point is just prepared and qualified for going in search of the Neibban (Nirvána) or the *absolute* exemption and *permanent* deliverance from the four causes productive of existence. . . . This is to him what the harbour is to the storm-beaten mariner, or deliverance to the worn-out inmate of a dark dungeon." This deliverance is to be found by following the four roads to perfection:—"Perfect belief, perfect reflection, perfect use of speech, and perfect conduct."

Readers who have only a limited knowledge of the subject are often puzzled by the many points of identity between Brahmanism and Buddhism, and are unable to decide whether some particular tenet belongs to the one or to the other or to both. The metempsychosis is common to both; the Nirvána of the Brahman and the Nibbán of the Buddhist have but a subtle difference. With the Brahman it means absorption into the divine essence of the

* *The Life or Legend of Gaudama, the Buddha of the Burmese.* With Annotations, &c., by the Right Reverend P. Bigandet, Bishop of Ramatha, Vicar Apostolic of Ava and Pegu. 2 vols. Third Edition. London: Trübner & Co. 1880.

universe; with the Buddhist it is, according to our author, absolute and permanent deliverance from existence. Gotama Buddha was by birth a Hindu, he was educated in Hindu philosophy and science, and was learned in all the wisdom of the Brahmans. When he became a religious teacher his great object was to bring about a change in the inner life of man, and to show the way to salvation or deliverance through a constant perseverance in well-doing, by a life of unvarying charity, purity, and humility. He interfered with Hindu science and philosophy no further than as they were at variance with his own doctrines, and his preaching was not directly antagonistic to Hinduism. He inculcated his own precepts, but did not assail the old religion. Hence it was that the two religions existed quietly together for a long period, and it was not till Buddhism had developed a formal system that it fell in India under the assaults of the Brahmans.

In addition to the Legend of Buddha, which constitutes the greater part of the two volumes, there is a long and learned essay on the "Seven Ways to Neibban," which is "an abridgment of all the principles that constitute the system of Buddhism." This, as the Bishop confesses, is a very abstruse and difficult subject, and "the reader must be prepared to wade up to his chin into the somewhat muddy waters of metaphysics." This is a sufficient warning to those who care not for such exercises; but it will have its attractions for some minds, and it must be studied by those who "wish to penetrate into the very sanctuary of Buddhism." This is followed by a chapter of much greater general interest on "the Phongyies or Buddhist Monks, sometimes called Talapoins, a name given to them and introduced into Europe by the Portuguese from their carrying a fan formed of *tála-pat* or palm-leaves." These monks are very numerous, they are all clad in yellow, and live in monasteries under the rule of spiritual chiefs. They are vowed to chastity, humility, poverty, and self-submission. They are to live upon alms; but, although they carry a special dish for the reception of gifts, they are not to beg. They practise confession, and one of their duties is to teach the young. "The Phongyies are highly respected by every member of the community. When they appear in public, walking in the streets, they are objects of the greatest attention. The people withdraw before them to leave a free passage. . . . The best proof of the high veneration the people entertain for them is the truly surprising liberality with which they gladly minister to all their wants. They impose upon themselves great sacrifices, incur enormous expenses, place themselves joyfully in narrow circumstances, that they may have the means to build monasteries with the best and most substantial materials, and adorn them with all the luxury the country can afford." This reverence and devotion of the laity has produced its natural results; the monks are reserved, cold, pretentious, and haughty. "Vanity and selfishness, latent in their hearts, force themselves on the attention of an acute observer," but "the most striking feature in their character is their incomparable idleness." "They are bound to read, study, and meditate; but their ignorance and laziness incapacitate them for such intellectual exercises. They remain during the best part of the day sitting in a cross-legged position, or reclining and sleeping, or at least attempting to do so. . . The teaching of their scholars occupies a few of them for a short time in the morning and evening, and they are often relieved from their mortal *ennui* by visitors as idle as themselves, who resort to their dwellings to kill time in their company." The good Bishop says in conclusion that he has "endeavoured to give a faithful account of this great religious order," and although he has "been obliged, for the sake of truth, to mention many abuses that have slowly crept into it," he has "never entertained the slightest intention of casting a malignant contempt or a sneering ridicule upon its members."

In this endeavour he has been completely successful. The whole work is marked with the purest candour and impartiality, and the result is a most interesting and exhaustive account of the origin and the doctrines of this great religion.

HUXLEY ON THE CRAYFISH.*

THERE are two ways by which a scientific knowledge of any branch of natural history may be attained. The mind may be prepared by a systematic study of the first principles or broad generalizations built up by biologists from patient and exhaustive exploration of the whole animal kingdom, the conclusions thus arrived at having to be impressed more or less dogmatically upon the tiro at the outset of his pursuit of nature. Or, contrariwise, the learner may be made to take in hand some individual member of the boundless family of living forms, to study its form and functions, to anatomize its structure, scrutinize its parts and organs, and, by gradual induction from the facts thus brought under observation, come to grasp and realize the laws and processes of vital action which this single specimen shows, in common with others more or less nearly allied to it. Of the two methods, how much soever professional teachers may differ in estimating their intrinsic logical value or their power to discipline the mind, few among learners will hesitate to choose the latter, if only for the charm it presents in bringing the faculties at once face to face with nature, instead of confronting them with abstract formulas.

* *The Crayfish: an Introduction to the Study of Zoology.* By T. H. Huxley, F.R.S. With Eighty-two Illustrations. London: C. Kegan Paul & Co. 1880.

We are glad to see this direct process of natural study adopted by Professor Huxley as an introduction to the study of zoology. He desires to show how the study of one of the commonest and most insignificant of animals leads step by step from everyday knowledge to the widest generalizations and the most difficult problems of zoology. For this purpose he has chosen the crayfish, as an animal easily to be met with, and, albeit common and lowly, capable of illustrating the entire range of biological questions which excite so lively an interest in our day. He cites Roesel von Rosenhof as showing it to be so full of wonders that the greatest naturalist may be puzzled to give a clear account of it. The attention of naturalists has already been largely drawn to the study of the crayfishes, as Professor Huxley shows by the ample list of books and memoirs, in addition to those mentioned in the text and the appendix, which he has brought together at the end of his treatise. In these the student will find the means of systematically carrying on the researches of which the author has so ably indicated the first steps, distributed under I. Natural History; II. Anatomy and Physiology; III. Development; IV. Taxonomy and Distribution. The materials which have up to the present time been collected are, he allows, too scanty as yet for the process of tracing out exhaustively in all its details the genealogy of the crayfishes, and determining, in relation both to geological time and to physiological descent, the various types or groups under which they come before us. The available evidence is nevertheless perfectly clear as far as it goes, and is, Professor Huxley maintains, in complete accordance with the requirements of the doctrine of evolution. If a completely satisfactory theory of the ætiology of the order is still to be regarded as a problem for the future, the present discussion may be taken as laying down the lines upon which the investigation is to be worked out.

If the results obtained by the study of the geographical distribution of the crayfishes are compared with those indicated by their morphological characters, the important fact of a broad and general correspondence between the two is brought to light. That wide belt of the equatorial region of the earth's surface which separates the crayfishes of the Northern from those of the Southern hemisphere is shown by Professor Huxley to represent as it were geographically the wide morphological differences which mark off the two primary divisions of the Potamobiidæ and the Parastacidæ, each group occupying a definite area separated by an extensive border-land untenanted by crayfishes. The two together form, in the metaphorical nomenclature of the zoologist, a tribe, the Astacina, based upon a common plan in nature to which the name of Protastacine has been given. That all crayfishes may be regarded as a modification of this original plan is not, our author argues, an hypothesis, but a generalization obtained by comparing together the observations made upon the structure of individual members of the tribe. In a very clear diagram he has drawn out a graphic illustration of the stages or steps of differentiation through which the forms now existing in nature have passed, ranging by modifications of the tribal, the family, the generic, and the specific plans, down to the morphological characters indicated by each individual form. Whilst from the Potamobine or Northern family are sprung the generic groups of Astacus and Cambarus, to the Parastacine or Southern are to be traced Astacoides, Astacopsis, Chæraps, Engæus, Parastacus, and Paranephrops. Having given an anatomical definition of the general tribe of Astacina, Professor Huxley goes on to define each of the two families, by superadding to the definition of the tribe the statement of the specific peculiarities of the family:—

Thus the *Potamobiidæ* are those *Astacina* in which the podobranchiæ of the second, fourth, fifth, and sixth thoracic appendages are always provided with a plaited lamina, and that of the first is an epipodite devoid of branchial filaments. The first abdominal somite invariably bears appendages in the males, and usually in both sexes. In the males these appendages are styliform, and those of the second somite are always peculiarly modified. The appendages of the four following somites are relatively small. The telson is very generally divided by a transverse incomplete hinge. None of the branchial filaments are terminated by hooks; nor are any of the coxopoditic setæ or the longer setæ of the podobranchiæ hooked, though hooked tubercles occur on the stem and on the laminæ of the latter. The coxopoditic setæ are always long and tortuous.

In the *Parastacidæ*, on the other hand, the podobranchiæ are devoid of more than a rudiment of a lamina, though the stem may be alate. The podobranchia of the first maxillipede has the form of an epipodite; but, in almost all cases, it bears a certain number of well developed branchial filaments. The first abdominal somite possesses no appendages in either sex; and the appendages of the four following somites are large. The telson is never divided by a transverse hinge. More or fewer of the branchial filaments of the podobranchiæ are terminated by short hooked spines; and the coxopoditic setæ, as well as those which beset the stems of the podobranchiæ, have hooked apices.

No other inhabitants of the fresh waters or of the land can be mistaken for crayfishes. But certain marine animals especially resembling the crayfishes have at times been included in the genus Astacus, such as certain kinds of lobster. The anatomical distinctions pointed out by Professor Huxley make abundantly clear the reasons for keeping this genus apart. In the common lobster, for example, Homarus vulgaris, the last thoracic somite is firmly adherent to the rest, the exopodite of the antenna is so small as to appear like a mere movable scale, all the abdominal appendages are well developed in both sexes, and in the males the two anterior pairs are somewhat like those of the male Astacus, but less modified. The chief differences are made clearly evident by the woodcuts, both of the entire specimen and of the anatomical parts shown on a larger scale. The lobster chiefly differs from the Astacina in regard to the gills, of which it exhibits twenty on either side—

namely, six podobranchiæ, ten arthrobranchiæ, and four fully developed pleurobranchiæ, these gills having their filaments much stiffer and more closely set than is the case in most crayfishes. Most important of all, the podobranchiæ have their stem as it were completely cleft into two parts longitudinally, one-half corresponding with the lamina of the crayfish gill and the other with its plume. "Hence in the lobster the base of the podobranchia bears the gill in front, whilst behind it is continued into a broad epipoditic plate, slightly folded upon itself longitudinally, but not plaited as in the crayfish." The distinctive anatomy of the Norway lobster (Nephrops norvegicus) is also explained by our author, who shows how these two genera, Homarus and Nephrops, constitute a family, Homarina, constructed upon the same plan as the crayfishes, but so far apart from the Astacina in the structure of the podobranchiæ and other points as to be relegated to a different tribe, nearer indeed to those of the Potamobiidæ than of the Parastacidæ. Still more distinct is the rock-lobster (Palinurus). Yet, differing as they do in appearance, size, structure, and habit of life, not only all the crayfishes, but the lobsters and rock-lobsters reveal to the morphologist unmistakable signs of fundamental unity of organization on a common plan. Even the common prawn (Palæmon) is very like a miniature lobster or crayfish, the number of the somites and of the appendages, with their general character and disposition, being the same, though lesser differences are shown between them, especially in the respiratory organs. Not far apart, again, is the shrimp (Crangon), differing from the prawn mainly in the character of its locomotive and prehensile thoracic limbs, besides the substitution in some species of the flat head for the sharp rostrum.

A short discussion of other forms of Crustacea, such as the crabs, popularly associated with the crayfishes, as well as the South American and Australian varieties of the latter family, leads Professor Huxley to face the final problem of biology, which is to find out why and how a class of animals of such structure and powers, and so localized or diffused, so different yet so homogeneous in plan, came into being. Setting aside as beyond the pale of science the idea of separate creation, he seeks the cause within the usual settled order of nature, under some form of the law of evolution. Narrowing this hypothesis once more by leaving apart the idea of abiogenesis, or the origin of the crayfish or any other living form from non-living matter—not a particle of evidence for any such process having been found in nature—we come to the doctrine of transformism, all existing kinds of crayfish being conceived as the product of the development or metamorphosis of earlier forms of living beings, the result of the interaction through long past time of two series of factors, the one a process of morphological and concomitant physiological modifications, the other a process of change in the conditions of the earth's surface. To account for the prevalence in Great Britain of fresh-water crayfish, which can hardly be supposed to have crossed the sea, we have to look back to the time when our present island group formed part of the European mainland; when a wide expanse of fresh water extended from the valley of the Danube to that of the Rhône, around the northern escarpment of the Alpine chain, where the glaciers had an enormously wider extension than at present. Still the head-waters of the Danube were connected with those of the Rhine, the Rhône, and the Northern Italian rivers. The Danube debouching into the Black Sea, then connected with the Aralo-Caspian Sea, an easy passage would thus be open for the crayfishes into Western European waters from those of the Aralo-Caspian area, to which we may with most probability look for the original home of the crayfish. From the same vast system of fresh-water lakes, extending from Lake Baikal westwards to Finland and Sweden, eastwards across Asia to Amurland, and, under geographical conditions other than the present, to the lake and river system of the North American continent, we may explain the distribution and subsequent variation of the Transatlantic crayfishes. It may be less easy to account for the presence of the crayfish in Japanese waters; but there is evidence for the belief in an extension of the Asiatic continent quite as far east as that group of islands, enabling us to conceive a common ancestral form, referable, it may be, to the Middle Tertiary formation, yet traceable, in the less developed or imperfect form of fossil remains, to the Jurassic or Triassic period. Professor Huxley's scale presents us with the hypothetical succession of forms of the Astacomorphous type, concluding with the remark that, if such a typical crustacean, having characters intermediate between those of Eryma and those of Pseudastacus, existed in the Triassic epoch or earlier; if it gradually diverged into Pseudastacine and Erymoid forms; if these again took an Astacine and Homarine character, and finally ended in the existing Potamobiidæ and Homarina—the fossil forms left in the track of this process of evolution would be very much what we actually find them. He has thus traced the pedigree and the affinities of a creature familiar to most parts of the British islands, though far less valued or made use of by us than by our nearest Continental neighbours, into whose *cuisine* it largely enters, and to whom we are doubtless indebted for its popular name, as we are for our mutton, beef, and pork, instead of the sheepsflesh, oxflesh, and swineflesh of our English forefathers. Crevis or crevice, the oldest form of spelling, is far more likely, our author thinks, a modification of the French *écrevisse* than of the Low Dutch *crevik*. In "cray" he sees simply a phonetic spelling of the syllable 'cre," in which the "e" was formerly pronounced as all the world except ourselves now pronounce that vowel; while "fish" is the "vis," insensibly modified to suit our knowledge of the thing as an aquatic animal. Though he does not explicitly say so, we apprehend that he attaches to "cray," in this instance, the etymology which makes it expressive of well-known names of places in the chalk country, indicating here the coating of lime which forms the outer skeleton and arms the limbs of the crayfish.

The reader of this valuable monograph will lay it down with a feeling of wonder at the amount and variety of matter which has been got out of so seemingly slight and unpretending a subject.

BREWER'S READER'S HANDBOOK.*

Of the making of queer books there seems to be no end, and this new *Reader's Handbook* is certainly one of the oddest of its class. It corresponds to a real dictionary very much as a policeman in a pantomime corresponds to the solemn functionary of the same name who protects public order in the streets. In its very nature it is farcical and grotesque; it might be called without injustice a very elaborate parody of a lexicon. The author trusts that it may be found to supply a want; without being flippant, we may reply that it certainly will to those who want to laugh. It will be invaluable to people who desire to know, in a great hurry, who it was that brought forward his thirty-two children and presented them as "a valuable offering to his king and country." They will learn from the *Reader's Handbook* that it was Count Abensberg, and that he was a mediæval gentleman who lived a long time ago. In the next page they will find with surprise and pleasure that "Accidente!" is a curse and an oath used in France occasionally, and that Sir Anthony Absolute was a testy but warm-hearted old gentleman, who imagined that he possessed a most angelic temper. The author remarks in the preface that he has borne in mind throughout that it is not enough to state a fact; it must be stated attractively. We thoroughly endorse this very innocent piece of self-laudation, and confess that we never saw miscellaneous information put forward more attractively, or indeed in a more pleasing strain of unconscious humour.

We hardly know whether to give the palm to those articles in the *Reader's Handbook* which deal with ancient or with modern history. For classic times Dr. Brewer seems to have chiefly trusted to that admirable scholar and antiquary who veils her genius under the pseudonym of "Ouida." Several very remarkable passages regarding the associates of Nero and the conduct of Greek life are drawn from the same rich storehouse of fiction. An instance of Dr. Brewer's treatment of the earliest history of mankind may be profitably given from the article "Adam":—

> Adam died on Friday, April 7, at the age of 930 years. Michael swathed (*sic*) his body, and Gabriel discharged the funeral rites. The body was buried at Ghar'ul-Kens, the Grotto of Treasure. His descendants at death amounted to 40,000 souls.

Modern events are treated in a style less exact, perhaps, but very solemnly facetious. Readers are sure to turn to the article "Blimber," as one supplying a long-felt want:—

> *Blimber (Dr.)*, Head of a school for the sons of gentlemen, at Brighton. It was a select school for ten pupils only; but there was learning enough for ten times ten. Mental green peas were produced at Christmas, and intellectual asparagus all the year round. The doctor was really a ripe scholar, and truly kind-hearted; but his great fault was overtasking the boys, and not seeing when the bow was too much stretched. Paul Dombey, a delicate lad, succumbed under this strong mental pressure.
>
> *Mrs. Blimber*, wife of the doctor, not learned, but wished to be thought so. Her pride was to see the boys in the largest possible collars and stiffest possible cravats, which she deemed highly classical.
>
> *Cornelia Blimber*, the doctor's daughter, a slim young lady, who kept her hair short and wore spectacles. She married Mr. Feeder, B.A., Dr. Blimber's usher.

Natural history, too, is not disregarded by Dr. Brewer, and the parody of *Maunder's Treasury of Natural History* is very excellent in such zoological articles as that on the "Aullay":—

> *Aullay*, a monster horse with an elephant's trunk. The creature is as much bigger than an elephant as an elephant is bigger than a sheep. King Baly of India rode on an aullay.

King Baly of India is a potentate of whom few of our readers probably have hitherto heard; and we are curious to know whether he was related to the famous Duke Baily, who, in company with Duke Humphrey, ate periwinkles with a pin in Mr. Gilbert's well-known ballad. It would be even a more curious instance, if the fact were so, of the relation of the infinitely great to the infinitely little than is Dr. Brewer's remarkable article on "Dwarfs," in which enormous erudition at second-hand is made to bear on the minuteness of humanity. We read of Philetas, a poet who was so small that he wore leaden shoes to prevent his being blown away by the wind. Dr. Brewer's guide and monitor in classical lore, the learned Ouida, must have been nodding when this paragraph was written, for the joke against Philetas was, not that he was so small, but that he was so excessively tall and thin. Calvin Philips, who weighed less than two pounds, and whose thighs were not thicker than a man's thumb, must have been a wonder and a delight to Bridgewater, Massachusetts, where he was born in 1791. But of all the dwarfs by far the most curious seems to have been Aristratos, who was so small that no one could see him. He also was a poet, and probably the only one who without offence could bear to be called a minor poet. There are no poets

* *The Reader's Handbook of Allusions, References, Plots, and Stories.* By the Rev. E. Cobham Brewer, LL.D. London: Chatto & Windus.

recorded under the article "Giants in Real Life," except Dr. Samuel Johnson, who is quaintly placed after Og, King of Bashan, and Chang-woo-goo, as the "Giant of Literature." We are told that Cornelius Magrath, the Irish giant, was "reared" by Bishop Berkeley, as if he had been an edifice within that prelate's patronage; and among historical personages of unusual height is rather unfairly included the Great Bed of Ware, whose proportions put the human giants to the blush. Becanus, it appears, said that he had seen a man nearly ten feet and a woman fully ten feet high, but Dr. Brewer gives us no reason to suppose that Becanus abhorred the sin of lying.

Facts, however attractively stated, cease to please as soon as it is observed that they are incorrectly stated. It would be a weary and a thankless task to follow Dr. Brewer through the jungle of his inaccuracies. Sometimes we find that he had a correct idea to start with, and lost it on the way; more often he began with a mistake. The article "Adonis" is one which can hardly have received final revision from Ouida. There is a certain laxity of style as well as of matter about this paragraph in particular:—

Shakespeare has a poem called *Venus and Adonis*. Shelley calls his elegy on the poet Keats *Adonais*, under the idea that the untimely death of Keats resembled that of Adonis.

We have here an instance of the benefits of labour. Had Dr. Brewer taken the trouble to refer to the history of Greek poetry when he was writing about Philetas and his leaden shoes, it is ten to one that he would have met with the names of Moschus and of Bion, and would have escaped another dreadful blunder. He is also unfortunate in the matter of Keats, for under another heading he volunteers the information that the review of the poem of *Endymion* in the *Quarterly Review* killed the poet. We thought it was finally settled long ago that the fatal illness under which Keats succumbed was in no way connected with the critical notices of his works. In the article "Poets of England" we are treated to a list of bards arranged in three classes of merit; the second class includes Shenstone, Keble, and Moore, while Burns and Scott are degraded to the third class, and Coleridge is omitted altogether. Dr. Brewer has the courage of Bentley in some of his proposed emendations. He observes, rightly enough, that the accent is upon the last syllable in the name Cambuscan, though he does not notice that the *can* is simply the title which we nowadays spell Khan. Accordingly he is indignant with Milton for accentuating the name falsely in a famous passage of *Il Penseroso*. Most of his readers will be of opinion that the wonderful music which Milton puts into these lines is more than sufficient excuse for so trifling a blunder, and will scarcely consent to alter

him who left half-told
The story of Cambuscan bold

to

him who left of old
The tale of Cambuscan half-told,

which is Dr. Brewer's emendation. The worthy Doctor has an article in his *Reader's Handbook* entitled "Bird told me (A little)"; we think the little bird might have told him that, in correcting Milton's small error, he was fatally ruining that much more essential quality, Milton's matchless harmony of verse.

We should be doing an injustice to the width of Dr. Brewer's scope if we failed to mention the homelier instances in which he puts a fact attractively. For instance, the article "Drink used by actors, orators, &c.," is strikingly original both in matter and manner, and should be studied very carefully. We can only refer to one or two of its paragraphs. It will be, no doubt, important to hundreds of students to learn that Mrs. Jordan drank nothing but calves'-foot jelly dissolved in warm sherry. That Edmund Kean took beef-tea for breakfast and cold brandy during the rest of the day has been recorded before, but it is new to us that Miss Catley could fancy nothing but linseed-tea and Madeira. Henderson confined himself to a mixture more mysterious, though perhaps less nasty than this, for he drank only gum arabic dissolved in sherry. Among these specialists, Mr. G. F. Cooke startles us by the catholicity of his taste, for his favourite liquid is "everything drinkable."

It is not necessary that we should multiply examples of the inaccuracy or frivolity of this extraordinary volume. Almost every page would supply us with something which might fairly be objected to on the ground of taste or fact. Nor can we admire the object more than the execution of the book. The aim of the compiler has been to supply an enormous commonplace book of data that lie outside the scope of ordinary lexicons and manuals. He has not known where to draw the line; and while he has descended in some cases to chronicle the most foolish gossip, he has neglected in others to touch upon whole fields of interesting knowledge. In the matter of the plots of novels he has dedicated to Dickens alone more space than to all the other novelists put together. The existence of a *Dickens Dictionary* may have had something to do with this superfluity. Finally, the only part of the volume which we can except from our general condemnation is the dramatic; it is, indeed, out of all proportion to the rest of the work, but, taken separately, it forms a remarkably complete and accurate companion to the play-house from the earliest times to the beginning of the present century.

LAPIDARIUM WALLIÆ.*

THE pioneers of a novel research almost inevitably perform their work under circumstances which conduce to partial disappointment. Professor Westwood's work on the Early Inscribed Stones of Wales is one to which Cambrian archæologists had been for some time looking forward, when the appearance of Dr. Hübner's *Inscriptiones Britanniæ Christianæ* anticipated it early in 1876. Their editor began his researches nearly forty years ago, and for more than half that period enjoyed facilities of inquiry and co-operation from the *Archæologia Cambrensis* and some of the earlier lights of the allied Archæological Society. Not, however, till the year in which Dr. Hübner published his work did the Cambrian archæologists decisively adopt Dr. Westwood's truly national project by subscribing for its publication in annual parts; and the preface to the concluding part tells us, what we can readily believe, that its completion is greatly due to the liberality of the Treasurer, the Rev. E. L. Barnwell. The works of Dr. Hübner and Professor Westwood do not cover identical ground, for, though the latter includes Roman inscriptions and sculptured stones not inscribed, this addition does not make up for the fact of the limitation of his area to the Principality and its Monmouthshire border. There is no serious cause for regret in his exclusion of the already well-edited stones of Scotland, though a few of them might have been figured with advantage; but it must be felt that the present work would have been more complete had it comprised the inscribed stones of Devon and Cornwall—in other words, of Wales south as well as north of the Bristol Channel. As may be seen from Dr. Hübner, who includes them, not many plates would have been added to the book, and, with the omission of all matter not strictly relevant, the Lapidarium would have been completer in its particular class of monuments. The course which has been adopted is the more to be regretted as it affords space for reprinting in many instances (as *e.g.* at p. 56 from the *Archæol. Cambr.* 1872) guesses of specious ignorance. We refer to a Brecknockshire inscription containing the names of Catacus and *Tegernacus*. The stone now resting in a buttress of St. Michael's Church, Cwmdû, has the undoubted legend, "Catacus hic jacit filius Tegernacus," and has been discussed by epigraphists from Daines Barrington's day down to Professor Rhys. Why then reiterate an anonymous suggestion that the letters are "Latinized Irish-Gaelic, not Welsh"? that "Catacus is the same word as Cathach; and Tegerna[cu]s as Tighearnas"; and that "both names are found combined in *Catigearn*, the assumed commander of the British forces opposed to Hengst and Horsa, and whose remains are supposed to have been interred in the cromlech, known as Kit's Coity House, Aylesford, Kent." Another example of Irish philology of the same school, occurring at p. 63, contains much that might with advantage have been omitted. It relates to the Inscribed and Oghamic stone at Trallong, Brecknockshire, which, according to Professor Rhys, bears the legend in Latin, "Cunoceni filius Cunoceni Hic jacet" (*i.e.* Here lies (the body) of Cynghen, son of Cynghen), and in Ogham "Cunacenniwi Ilweto," for which (See Rhys's *Lectures on Welsh Philology*, p. 395) patient research has found an approximate interpretation. But what light or help to the analysis of the Celtic characters could follow from the quotation which Professor Westwood reprints from Mr. R. B. Brash's paper on the Ogham stones of Wales (*Arch. Cambr.*, 1869, p. 162)? "The Oghams," we are told in p. 63, were read by Mr. Brash "Cu Nacen ni ll il feto," *i.e.* "Cunacen, a warrior, pierced [by] many wounds [lies] beneath in silence," "a rendering in accordance with our knowledge of the Gaedhelic language, and without violence to the original, neither adding to, taking from, or altering a single letter." In the same work (1871, p. 327), as the Professor goes on to say, Mr. Brash adds "that though the word '*Ni*' does signify 'a warrior,' it is here the genitive case of the preceding proper name."

It may perhaps be urged that, considering the hindrances which students of a less exact school than the Oxford Professor of Celtic might be excused for imperfectly surmounting in the difficult problem of proper names, a sufficient criterion of the merits of the *Lapidarium Walliæ* may be looked for in its plates. But why, then, their uniform hue of dingy yellow—the sole point of contrast, as regards many of them, between the figures in the present work and those from which they have been virtually borrowed in the earlier volumes of the *Archæologia Cambrensis*? And this in spite of their established inaccuracy and more recent correction. Some, it is true, have been corrected, thanks to a lively passage of arms at the Cambrian meeting at Carmarthen in 1875; but others stand as they were, to wit the Spittal Stone in Pembrokeshire, the legend on which Professor Westwood still gives as EVALI FILI DENO, though the word has been shown to have two more letters. These, it is true, have been referred to in the letterpress of the *Lapidarium* (p. 109), but the drawing in fig. lii. 2, stands, if we may believe our eyes, just as it stood in the *Archæologia Cambrensis* of 1861, p. 303. Yet this is just where Professor Westwood's work might have been expected to surpass Dr. Hübner's; and we regret that he did not deem it of paramount importance to have all his drawings carefully revised. So far from this, in Mr. Longueville Jones's drawing of the Kilgerran Stone (*Arch. Cambr.* 1855, pp. 9-10), communicated in a paper by

* *Lapidarium Walliæ: the Early Inscribed and Sculptured Stones of Wales.* Delineated and described by J. O. Westwood, M.A., F.L.S., &c. Oxford University Press: 1876-9.

Professor Westwood, there appear a few Ogham digits, which are again figured in the *Lapidarium* (Plate liii. 1-2, p. 110), but without any attempt at a drawing which would represent the Ogham legend in a complete form, though it is one of the most important in the Principality. And the Olydai Ogham, p. 123, plate lix. fig. 2, remains in the same incorrect form in which it was published in *Arch. Cambr.* 1860, p. 125, although the Roman letters accompanying it have been at last corrected.

Professor Westwood's faith in a rubbing once made or obtained is apt to become a snare to him; whereas, in point of fact, in the case of inscribed stones, a rubbing, however exact, is hardly of any value, save as a reminder to one who has examined the stone of the forms of the letters he saw upon it. The stones are commonly so rough that the rubbings reproduce divers lines which are really no part of the letters, but which, without other criteria, are hard to discriminate from them. "Have you ever," crates to Strepsiades in the *Nubes*, "when you looked up, cloud like a centaur, a panther, a wolf, or a bull?" "By have; but what of that?" "They become all things, whatsoever they please," is the philosopher's answer. And it is with stone-rubbing as with cloud-gazing. They do not assume the same form to any two observers. And this Dr. Westwood's long experience should have taught him. But what do we find about the Vitalianus stone in the *Lapidarium*, pp. 103-4?

In Gibson's *Camden*, p. 638 (Gough, *Camden*, ii. p. 521), a stone is described as standing on the N. side of the Church of Nevern, two yards high, triquetrous in form, and inscribed in Roman capital letters

VITALIANI
EMERETO,

the A and L in the upper line being conjoined and the N reversed. Tegid and I searched in vain for this stone, as stated in *Arch. Cambr.* 1860, p. 52, where it was added that some years previously a cross (possibly one of two described above) had been moved from Nevern to Cwm Gloyn, a farm two miles distant, by Mr. Owen. Here ten years later it was discovered by Professor Rhys, who has placed in my hands the rubbing from which my figure is drawn, the letters being between three and four inches high, and occupying seventeen inches along the front of the stone. From the rubbing it appears that the second name should be read Emerito rather than Emereto, as given by Rhys, *Arch. Cambr.* 1873, p. 387; 1874, 20.

So far the *Lapidarium*, and on the strength of this rubbing the Professor adopts "Emerito" on his plate (51-8), and makes the other name VITALIANI, or something like it; and all this in spite of the evidence of personal inspection, and though there is no doubt of the right reading, the letters being in good preservation. Had he reason for doubting the reading, he should have had the stone re-examined and correctly redrawn; and the omission to do this suggests a caution to students using the *Lapidarium* not to place implicit trust in readings based on rubbings alone, without other trustworthy information to check or correct their confused testimony. Unfortunately this category includes several of which the originals are no longer known, among them a stone which Professor Westwood believes to have come from Heriri Mons or Tommen y Mur, and which he gives in Pl. 78, 4; cp. letterpress, p. 156, as reading—

DM.
BARRECT—
CARANTEI.

This inscription, if implicit belief could be placed in it, would be of paramount interest, as exactly marking the transition from ordinary Roman to ordinary British inscriptions, and exemplifying the implied formula for Dis Manibus on this very early stone. But we fear it is too good to be true; for we recall a pathetic episode of the Cambrian meeting at Lampeter in 1878, when Professor Westwood, having got wind of another British inscription beginning with DM, was preparing his hearers to shed tears over its supposed destruction, but a vexatious straggler interrupted the melancholy tale with the glad tidings that he had just found the stone safe and sound, and that he agreed as to the DM, except that he was constrained to add that in this instance the letters did not refer to anybody's *manes*, but to David Morris, or Daniel Morgan, who, with a gentleman named Singer, had bethought himself of the old stone as a means of securing immortality. Professor Westwood, in explaining at *Lapid.* p. 149 (cf. Plate xxi. 6, Inscribed Maenhir near Cellan) that the stone had been confounded with another called "Maen pen foel gwalt gwyn," standing on the adjoining hill, lays himself open to the suspicion of having been entrapped by another little hoax of a Lampeter wag, if, as we are credibly informed, the above five monosyllables can only mean when interpreted, "The Stone with the bald top, O thou man of the white hair."

Our main ground of difference with the author of the *Lapidarium Walliæ* lies in the conviction that greater pains might have procured more trustworthy representations of the stones. When he has once examined a stone, or got a rubbing of an inscription, his mind is in a state of fixity and finality about it; whereas had he been always as keen to correct his first impressions as he shows himself to record his discoveries and achievements in British epigraphy, he would probably not now have occasion to complain that Dr. Hübner thinks fit to warn his readers, in reference to a legend which he knew only on our author's showing, "Lectionem sola Westwoodii fide stare ne obliviscaris" (*Inscript. Brit. Christ.* 138, p. 49). Of the inscription referred to by Dr. Hübner Professor Westwood's version is not accurate even so far as it goes, though the stone is at Llannor, in Carnarvonshire, and has been lately removed into a position where every letter on it might be read; and if Professor Rhys's "secundæ curæ" came too late for rectifying the plate, he might have set himself right in the "additions and corrections." A like reticence in the case of one of the Dolau Cothi stones makes him still seemingly acquiesce in the reading MAQVERAG of the fourth edition of Gibson's *Camden*, though the MAQVERIG of the other editions is more probably correct.

We must also say a word as to our author's language in describing, in various parts of his work, the forms of the letters with which he has to do, as, in p. 27, he speaks of a "G" of the minuscule form, and at p. 177 of another being "rudely minuscule without a top bar." This language is so puzzling that amateur stone-hunters will do well to correct their reading of the *Lapidarium* by a diligent study of Professor Rhys. It would be an ill return, however, for Professor Westwood's labour of nearly forty years in amassing materials for a work which contains plates and descriptions of every extant or traditional inscribed stone of the Principality, if we were to allow ourselves to be understood as finding fault with the book as a whole, or as implying that as a guide to one of the chief archæological interests of Wales, it is other than a valuable work, especially if supplemented by Dr. Hübner and Professor Rhys. Such untiring industry cannot but have contributed to preserve the record of many famous stones despite the occasional drawback of critical slips; and if we cannot exactly regard the author of the *Lapidarium Walliæ* as the father of Brit-Welsh epigraphy, he has at least done very much to give it the rank of a study possessed of an individuality of its own.

FOUR MONTHS IN A SNEAK-BOX.*

OUR readers will be as much puzzled as we were ourselves to know what kind of a thing a Sneak-Box is, in which Mr. Bishop, the author of the book before us, passed no less than four months of his life. A Sneak-Box, we learn from him, is "a purely American model, developed by the bay-men of the New Jersey coast, and recently introduced to the gunning fraternity." Its inventor is Captain Hazelton Seaman—Uncle Haze, as he is familiarly called by his many admirers. Happily he still survives, and has not yet joined in the Elysian fields that group of worthies,

Inventas aut qui vitam excoluere per artes.

Among them, indeed, he will surely be remembered when New Jersey has to yield him up to a better world. For not only has he invented the famous Sneak-Box, but also "during the year 1875 he constructed a new ducking-punt with a low paddle-wheel at the stern." What, compared with such a man as this, is even the famous Twalmley whom Johnson told of, who invented the New Flood-gate Iron and at once became great? It is not surprising that Mr. Bishop celebrates Uncle Haze's praise. "To find such a boat had been with me," he writes, "a study of years. I commenced to search for it in my boyhood, twenty-five years ago." He had travelled in seven foreign countries, carefully examining numerous small boats, he had studied the models at museums and exhibitions, but had failed to discover the object of his desire until the happy day arrived when he visited the shores of New Jersey. He shows his gratitude by writing the history, not only of the builder, but also of the boat. Happily he found generous and able help in his task. "With the assistance of William Errickson, of Barnegat, and Dr. William P. Haywood, of West Creek, Ocean County, New Jersey, I have been able to rescue from oblivion and bring to the light of day a correct history of the Barnegat sneak-box." Into this history we shall not venture to follow our author. "The reader of aquatic proclivities," to use his own term, will, we feel sure, by no means relish a mere abstract; while to any other reader even an abstract would prove intolerably dull reading.

Enough has been said by us about the boat and its builder, and we must now follow Mr. Bishop in his long voyage. We have read it, we must confess, with considerable satisfaction. We are delighted to find that, in one point at least, the Americans are as mad as we are ourselves. Even if he had been an Englishman, president of some canoeing or Alpine club, he could not have gone intentionally and of malice prepense through a longer course of utter discomfort. He can, indeed, boast that he has made a boat voyage of 2,600 miles down the Ohio and Mississippi rivers and along the Gulf of Mexico. In the last part of his voyage he may have seen something that was worth seeing, but the greater part of it seems to us to be nothing but almost intolerable discomfort. He launched his boat on the Ohio at Pittsburg in the beginning of December. For some weeks he had a race, as it were, with the frost, for he ran a great chance of being caught in the ice. In fact, in one place his boat was frozen in for some days. When it was not freezing it very commonly rained. The scenery seems to have been almost the whole way of a most dreary kind. At first he passed through the district of the coal mines, oil wells, and iron-foundries; but even when he had gone by these and escaped from the clouds of smoke, he makes scarcely any mention of scenery which could enliven the traveller on his lonely voyage. The banks of the two rivers for almost the whole course seem to have been flat.

* *Four Months in a Sneak-Box: a Boat Voyage of 2,600 Miles down the Ohio and Mississippi Rivers, and along the Gulf of Mexico.* By Nathaniel H. Bishop, Author of "A Thousand Miles' Walk across South America." and "Voyage of the Paper Canoe." Edinburgh: David Douglas. 1880.

He had constantly a great difficulty in finding a place where he could encamp for the night. He always slept in his boat; but if he moored it he ran the constant risk of having it swamped by the waves raised by the passing steamers. If he ran it aground the wash still disturbed him, and it was far too heavy to drag with any ease up the shore. More than once, as he slept under the bank, he was nearly swamped by the mass of earth which slipped down on to his boat.

He kept during the night as far as he could from the track of the steamers, but even this course led him once into great straits. He had pushed his boat into a soft, muddy flat of willows. When he woke in the morning he found that the river had sunk in the night, and that his craft was imbedded in mud so soft and slimy that it would not support his weight when he attempted to step upon it in order to push his boat into the water. There, it seemed, he must stay till the river rose. No help could come to him, for he could neither be seen from the land nor from the vessels which passed along the other bank. He managed, however, with the willow-branches which he could reach, to make a kind of "mattress," which, when laid on the mud, bore his weight as he pushed off the boat. His meals were as cheerless as meals could be. For a long while he had no stove or spirit-lamp. The wood was too wet to allow him to make a fire. At the end of his first day on the river, which he had spent in forcing his way through the ice without having time to stop for food, he prepared his supper. "Bread and butter, with Shakers' peach-sauce, and a generous slice of Wilson's compressed beef, a tin of water from the icy reservoir that flowed past my boat and within reach of my arm, all contributed to furnish a most satisfactory meal." We notice, however, that of this cold fare he soon gets tired, and never loses a chance of having his food cooked on any friendly barge. For the first two or three weeks his meals consisted almost entirely of cold food and cold water. Even the icy reservoir did not always treat him kindly; for at times the water was so muddy that it could not be drunk till it had had time given it to settle. One morning he awoke to find that the thermometer marked only six degrees above zero and that his boat was frozen fast. His provisions were frozen also, and he had no means of melting them. Nature was too strong for him, and he was forced for a time to take refuge in that civilization from which he had so joyfully escaped. It was fortunate that it was close to a town that he was thus caught in the ice. He went to look for lodgings, and found them in the house of a German tailor. The honest man at first looked on him with great suspicion:—

> He examined me closely, and having made, as it were, a mental inventory of my features, dress, &c., exclaimed, "Mine friend, in dese times nobody know who's which. I say, sar, nobody knows who's what. Fellers land here and eats mine grub, and den shoves off dere poats, and nevar says 'tank you, sar,' for mine grub. Since de Confederate war all men is skamps, I does fully pelieve. I fights twenty-doo pattles for de Union, nots for de monish, but because I likes de free government; but it is imbossible to feeds all de beebles what lands at Pleasant Run."

The tailor's wife thought it needful to apologize for her husband's bluntness. "Nobody," she said, "knows who's who nowadays. Seems as if everybody had got 'moralized by de war." However, at last they came to trust him entirely, and gave him a better room, assuring him that they knew "who was who."

To the discomforts of the voyage and the dreariness of the scenery were added the rudeness of the boatmen and the dangers of violence both from man and beast. Mr. Bishop says that to avoid the rough characters it was necessary always to enter the night's camping-ground unobserved. When once he was secreted, and covered by the friendly shades of night, he felt perfectly safe. As he slept, he was shut in by the cover to the hold. He had a hatchet and a Colt's revolver by his side, and a double-barrelled gun, carefully charged, snugly stowed away under its deck. At New Orleans he ran considerable risk from the brutal and ignorant mob, among whom rumours had spread that he was "a national Government spy." He was protected, however, by some friendly sailors, one of whom assured him that, if he had been attacked, "they would have backed every man's head down his own throat." Generally, however, he was troubled by nothing worse than such questions as these. "Say, stranger, where did you steal that pumpkin-seed-looking boat from? How much did she cost, any way?" Though he was roughly treated at New Orleans, yet he noticed that, in the South, men seemed always to have time to give a civil answer to any necessary inquiries. This was very far from being the case in the North. In the midst of the wildness of his life he never forgot the decencies of civilization. Thus one Sunday he really did arrive at a pretty camping-ground beneath some great trees on which some parakeets were hopping about. "In this retired haunt of the birds I remained," he writes, "through the whole of that sunny Sunday, cooking my three meals, and reading my Bible, as became a civilized man." We are delighted to find that our kinsmen across the Atlantic hold with us in the faith that three good meals are an important and a solemn part of Sunday observance. We are sorry to have to add, however, that he had, not roast-beef, but an omelette and wheaten grits. He did, no doubt, the best he could properly to observe the day, and we must not be too hard on him. The next day he somewhat made up for his neglect by investing, when he arrived at a town, "in a basketful of mince-pies, that deleterious compound so dear to every American heart." The author now and then openly and avowedly boasts of his country; but nowhere does he more excite the admiration of strangers than when, without the least ostentation, he thus shows us that an American, a man old enough to have spent five-and-twenty years in search of a sneak-box, buys mince-pies for his own consumption by the basketful. Even the captains of the football clubs at our greatest public schools could not buy mince-pies by the basketful. It is in vain for us to pretend to strive with such a nation. Our roast-beef and our plum-pudding carried us safely through the long French war; but what was a race of frog-eaters compared with those men, each one of whom takes his mince-pies by the basketful?

We scarcely know whether Mr. Bishop's pride in his country adds, on the whole, to the interest of his narrative. At times it is not a little amusing, but too often it leads him into somewhat dull details. Thus he reaches Cincinnati. His heart exults as he visits this seat of the pork trade. He recounts how many pigs had been slaughtered and packed in this one town during the past twenty-one years. "The total swells to 12,300,589 hogs, duly registered as having been killed by the pork-packers." We dare say these figures are quite correct. They fail (we are ashamed to confess) to convey much meaning to our minds. A total of more than twelve million hogs is too much for us to grasp. Yet statistics are often misleading. The other day we noticed in a magazine a surprising statement about the number of eggs imported into these islands every year. Failing, as we always do fail, to seize the notion of thousands of millions, we thought that we would ascertain how many eggs every one of us—man, woman, and child—consumes each day. But we were more surprised than ever, for so highly favoured are we that, if this statement be true, the daily consumption of each one of us is about thirty-five eggs. When we think of this, we may take courage again and not be afraid even of the consumers of mince-pies by the basketful. But to return to Mr. Bishop. From pork-packing he gets by an easy and natural transition to the *Trichina spiralis*, and from the *Trichina spiralis* to the *Cysticercus cellulosus*. At first sight the parasites that infest the pig would seem to be but remotely connected with a boat-voyage down the Ohio; but yet, as the reader will have seen, there is no break in the narrative. The only pity is that Mr. Bishop found the river frozen at Cincinnati.

We are surprised to find that he has sorrowfully to own that "the study of physical geography has not been developed among my countrymen." Their maps are very inaccurate. He once asked the agent of one of the largest map establishments how he got "the interior details." "'Oh,' he answered, 'when we cannot get township details from local surveyors, we sling them in anyhow.'" And yet, as Mr. Bishop points out, what a rich reward awaits every American who once grasps what we may well consider as the greatest fact of geography. But we must give this fact in his own words:—

> I nevertheless feel it a duty to place on record a few facts that are well known to scientific men, if not to the writers of popular geographies, regarding the existence within the boundaries of our own country of the longest river in the world. It is time that the recognition of this fact should be established in every school in the United States. As this is a very important subject, let us examine it in detail.
>
> THE MISSOURI IS THE LONGEST RIVER IN THE WORLD, AND THE MISSISSIPPI IS ONLY A BRANCH OF IT.

The Amazon is soon shown to be an impudent pretender, for "there is one river within the confines of our country which is eight hundred and thirteen miles longer than the Amazon." We are reminded how a friend of ours was standing, with some other Englishmen, by an American gentleman on the deck of a steamer which was leaving Constantinople. The English were admiring the mosque of St. Sophia. "I guess," said the Yankee, "we have got a bigger conventicle than that in New York." Not only may the United States boast of having the largest river and the largest conventicle; recent discoveries have proved that they have another claim to imperishable glory. A few short years ago "science was blind to the fact that the true crocodile was a member of the fauna of the United States." Happily Mr. C. J. Maynard, of Newtonville, Massachusetts, arose, and to him "belongs the honour (honor Mr. Bishop writes it) of killing and recognizing one of these huge monsters." Of these great facts we cannot pretend to speak with any authority. We are content with putting it on record in an English journal that—to use an American expression which we find more than once in the book before us—the Missouri "claims" to be the longest river in the world, the true crocodile "claims" to be a member of the fauna of the United States, and the mosque of St. Sophia could not rightfully "claim" to be as big as the biggest conventicle in New York.

GERMAN LITERATURE.

THE life of a great man may be written from many different points of view, and more particularly so when the great man is a great author. The latest biographer of Goethe (1) does not enter into competition with Mr. Lewes by treating his subject on the literary side, the ethical side, or in any of those aspects which are indeed the most interesting and important, but in handling which a partial failure is almost inevitable. He has confined himself to a department of less moment indeed, but in which complete success is attainable, and he has attained it. His volume is the fullest and most accurate record of the incidents of Goethe's life that can be

(1) *Goethes Leben.* Von H. Düntzer. Leipzig: Fues. London: Williams & Norgate.

desired. It accounts for the employment of Goethe's time in the completest manner, traces out the history of all his works, and shows their connexion with the contemporary incidents of his life. A better illustration of the *votiva pateat veluti descripta tabella* could not well be found. At the same time Herr Düntzer is never dull, or trivial, or verbose. Versed in all the enormous mass of Goethe literature, he handles it with perfect ease and decision, assigns every item to its place, and deals concisely, and yet adequately, with everything. The higher qualifications of the [illegible]pher, if they exist in him, are latent here; but his undertaking does not require them. He appears simply as the arranger and condenser of a vast body of material, providing students of Goethe with a most useful companion to his writings, and more ambitious biographers with a clue which they will not disdain. Of criticism there is little or nothing; the merits of Goethe's works are taken for granted; and the commentator's task is confined to indicating the circumstances which produced them or gave them their peculiar colour. Such a treatment necessarily involves an adequate notice of Goethe's contemporaries as far as they were connected with him, and the crowd of figures thus introduced imparts great animation and variety to the narrative. On the whole, the book is most interesting; and, although its pretensions are not of a high order, it will be found more permanently valuable than many more ambitious essays in biography. The copious and excellent illustrations would alone give it importance, comprising portraits of Goethe at all periods of his life, facsimiles of his handwriting, and representations of persons or places celebrated from their connexion with him.

Dr. A. Fournier's new contributions to the history of Gentz (2) do not relate to that most interesting part of his life when he had become the *fidus Achates* of Prince Metternich. They principally concern the armed peace which existed between France and Austria from 1801 to 1805, the negotiations which transferred Gentz's services from Berlin to Vienna, and his endeavours to foment a warlike policy from the time of his entrance upon the Austrian service. These led to a temporary estrangement between him and his patron Cobenzl, then Minister for Foreign Affairs. Cobenzl, a diplomatist of the eighteenth-century school, regarded European questions solely from an Austrian point of view. Gentz, whose one moral principle was patriotism, considered them in their relation to the general interests of Europe. There is no reason to doubt the perfect sincerity of Gentz's antagonism to the Revolution; it is indeed this rare alliance of almost fanatical intensity of conviction with general laxity of principle that renders his character so interesting a study. These points are well brought out in Dr. Fournier's book, which also contains numerous and striking illustrations of the administrative disorganization of Austria at this critical period of her history.

The English translation of Prince Metternich's Memoirs (3) has obtained such general notice that it is needless to do more than record the publication of the German edition.

Christoph Falk's chronicle of the Prussian town Elbing (4) is in general uninteresting, but incorporates a very circumstantial account by an anonymous writer of the transactions between 1521 and 1526. Some parts of this are expressed with much dramatic vividness, and the whole is well worthy of publication.

Professor Brückner's (5) researches on early Slavonian settlements in the Magdeburg district are chiefly philological, and incidentally throw light on the theory of a recognizable Slavonian element in the population of the existing kingdom of Prussia.

The history of the German settlements in Livonia, Esthonia, and Courland (6) during the middle ages is full of interest. It is the story of conflict between Christianity and heathenism, civilization and barbarism, complicated by the peculiar relations occasioned by the introduction of the Teutonic Knights, whose military rule was not always acceptable to the burghers of the chief commercial towns. The native Esthonians and Letts stood in much the same situation to the settlers as the Caffres now occupy to the colonists of Natal, constituting a regularly organized, though uncivilized, community, unable to contend with the intruders on equal terms, but too numerous and too much inspired with the sentiment of nationality to be expelled or absorbed by their conquerors. At a later period Poland, Sweden, and Russia appear upon the scene, the district becomes alternately and successively their prey, and the German Confederation disappears as an independent State. The German nationality, however, remains, and the adjustment of its privileges and interests with the claims of Panslavism will one day add another to the list of international controversies. The anonymous author has treated his intricate theme with dexterity, and made an obscure and barbarous period of history so entertaining as to warrant high expectations of his second volume, which will have a direct bearing on the problems of our own day.

Dr. Nöldeke has performed an acceptable service by his translation of the section of the Arabic historian Tabari's (7) universal history, which contains the annals of Persia under the Sassanian kings. Tabari was a mere compiler, but judicious and elegant, and this part of his history is probably based upon the lost Khodha Nameh, or Book of Kings, a chronicle of the Sassanian dynasty probably corresponding to the Achæmenian annals mentioned in the Book of Esther. In general, his narrative is sober and straightforward, and the romantic traditions it contains, while greatly enlivening it, are easily separable from the authentic portion. It is also very pleasant reading.

Professor Kirchhoff (8) puts forward his theory respecting the composition of the Odyssey in a complete and revised form. In his view, the Odyssey consists of two poems, the second of which, however, never had an independent existence, but was added as a continuation to the first in the same manner as the *Orlando Furioso* continues the *Orlando Innamorato*. The first part contains the first twelve books as far as xii. 182, with the exception of Books ii., iii., iv., and much other interpolated matter. The second part comprises the remainder of the poem to the end of Book xxiii., also with numerous insertions. The date of the first part is considerably prior to the first Olympiad, that of the second about Olympiad 30. The two differ completely in structure, that of the former being, after the interpolations have been removed, homogeneous, and the piece proceeding wholly from a single author; the other being an amalgamation of distinct lays of earlier date. The union of the two constituted the text to which the editorial committee of Pisistratus had recourse. Such is the form which the hypothesis of Wolff, so far as the Odyssey is concerned, has assumed in the hands of Herr Kirchhoff, whose exposition includes a reproduction of the text, the supposed interpolations being distinguished by a smaller type, and whose critical views are conveyed in six excursuses and a running commentary.

The Gorgons are represented by the poets as dwelling on the confines of the Western ocean; in Greece the most violent thunderclouds commonly come from the west; the Gorgons are ugly and terrible, so are thunderstorms; there are three chief elements in a thunderstorm, cloud, thunder, and lightning, and there are also three Gorgons. It is accordingly apparent to Herr Röscher (9) that a Gorgon is the third part of a thunderstorm, and should he ever discover that Shelley describes Medusa as endowed with "the tempestuous loveliness of terror," he will probably affirm with equal reason that Shelley thought so too.

Professor H. D. Müller's essay on the development of the Aryan family of languages (10) is especially dedicated to the investigation of roots, and the decision of the question whether roots are actual words at one time in use, or mere philological abstractions. Professor Müller supports the former view, and contends for the original identity of verbal and pronominal roots in the most primitive stage of human speech.

H. Bebel (11), Professor at Tübingen in the early part of the sixteenth century, a man of considerable scholarship and humour, translated a number of the best German proverbs into very elegant Latin. Dr. Suringar has republished this curious work, with copious illustrations from the German and Dutch vernacular, and the metrical renderings of proverbs into Latin, current in the sixteenth century.

The most recently published part of the historical series edited by W. Oncken (12) is occupied by the commencement of a history of ancient India by Professor Lefmann. The period comprehended in the present instalment is that from the first Aryan settlement to the birth of Buddha. It follows that there is so far little of a strictly historical character in the work, which is rather a learned and not too abstruse treatise on Indian antiquities, covering nearly the same ground as Mrs. Manning's *Ancient India*.

The third and concluding volume (13) of Albrecht Weber's *Indische Streifen* is a contribution to Indian literature of the highest importance, being a reprint of all the notices of philological and antiquarian works relating to India, written by the learned author since 1869. As hardly anything of importance has escaped him, and Indian philological literature during the period has been remarkably rich, the collection abounds with matter of the most varied interest, while Dr. Weber's authority, it need not be said, is magisterial. Among the most important works reviewed may be mentioned Colebrooke's Essays, Beames's Comparative Grammar of the Indian Languages, Burnell on South Indian Palæography, Childers's Pali Dictionary, Ludwig and Grassmann's Translations of the Rig Veda, Beale and Senart on Buddhism, and Monier Williams's Dictionary of Sanscrit.

The definition of Christian Philosophy propounded by Dr.

Pünjer (14) is assuredly liberal, as his scheme embraces Hume and Spinoza. It is no doubt true that the general course of speculation cannot be properly followed without reference to those thinkers by whom it has been, principally influenced, whatever their creed or school. The most meritorious part of Dr. Pünjer's labours is not, however, his inspection of such oft-travelled regions of thought, but his account of many obscure and forgotten thinkers whose philosophy actually conformed to Christian theology. His sketch of the philosophical opinions and tendencies of Zwingli, Taurellus, Schwenckfeld, and the early Socinian school, is interesting in itself, and supplies information not readily to be met with.

Dr. J. J. Baumann (15) remarks that two essential elements may be distinguished in modern writings on ethical philosophy—the desire to follow out the development of ethics historically as the surest test of the gradual progress of mankind, and the contemplation of ethical doctrine as something already complete; the standard not of man as he is, but as he ought to be. The object of his work is to reconcile both. In a postscript he notices the appearance of Mr. Herbert Spencer's *Data of Ethics* since his own volume went to press, and expresses his general agreement with it, except in so far as it depends upon the theory of evolution, for he cannot hear of "a metaphysical hypothesis." The saving clause is almost as comprehensive as the classification of evolution with metaphysical hypotheses is amazing.

Mme. von Racowitza's memoirs of her acquaintance with Lassalle did her little honour, they still seem respectable by the side of Herr Kutschbach's (16) undisguised bookmaking. The lady might be allowed to think that her share in Lassalle's catastrophe stood in need of explanation; Herr Kutschbach's publication can have no other object than that of pandering to a morbid curiosity. It can only be said for him that, if the documents which he prints are genuine, he will have done something to enlighten the public on a matter with which it has no concern.

Times have changed since English actors occupied the position now held by Italian singers, and riveted the attention of audiences ignorant of their language. Such was the case in Germany during the early part of the seventeenth century, until the Thirty Years' War put a stop to all public amusements. It seems the more remarkable when it is considered that the pieces which commanded such popularity in Germany were by no means the pieces of Shakspeare. They were, indeed, unworthy of the humblest of Shakspeare's contemporaries, and any little merit they may have possessed seems to have been almost obliterated by the "gag" of the performers. That such was the case the collection of their pieces reprinted by Herr Tittmann (17), from the edition of 1620, affords ample testimony. They are but slightly above the level of puppet plays. Some of them, however, possess considerable interest from their relation to better dramas. *Fortunatus* has a certain affinity to Dekker's masterpiece and to the charming creation of Tieck, which is indeed derived from the same source. *Esther* and *The Prodigal Son* may be compared and contrasted with the old miracle plays and Calderon's *autos*. *Somebody and Nobody* is, in Herr Tittmann's opinion, older than Shakspeare. *Julio and Hippolyta*, though a tragedy, is founded on the same idea as *The Two Gentlemen of Verona*. The translator or adapter of these pieces was, Herr Tittmann thinks, a German, who stood in some relation with the English troupe. It is worthy of remark that so long as the English actors were strolling players their performances were given in English, but that when they settled anywhere they were bound by contract to learn German.

The life of the ancient Egyptians would probably be as fertile in incidents for the novelist as that of any other people, if we knew more of it. At present we can hardly get beyond two or three typical characters and situations. Herr Ebers has made the most of these on two former occasions, and now shows his recognition of the fact by judiciously declining to glean after himself; and, while retaining the Egyptian scenery which he knows so well how to paint, peopling the foreground with personages better known and nearer to our sympathies. In *Homo Sum* he depicted the life of Christian anchorites; "The Sisters" (18) is a romance of the Ptolemaic period, and the characters are mostly Greek or Roman. The principal ones are Ptolemy Physcon, the most cruel, luxurious, and oppressive, though not the least lettered, of his race, but who talks too much and does too little to produce altogether the impression designed by Herr Ebers; his sister Cleopatra, a successful study of a royal but still feminine nature, half sentimental and half voluptuous; and Publius Scipio Nasica, whose relation to Ptolemy is nearly that of a British Resident in India to a native prince. It is a matter of course that the manly and upright Roman should baffle the dissolute tyrant's plots to possess himself of the noble maiden Clea and her sister, that he should reject the overtures of Queen Cleopatra, and eventually adjust everything by the magic of his *Civis Romanus sum*. The chief interest, nevertheless, is not in the action, but in the vivid picture of Alexandrian civilization at a period of great brilliancy, refinement, and corruption.

Rudolph von Gottschall's "Golden Calf" (19) is a combination of all things appropriate to a romance of modern society, including poetical justice. It is compounded by an experienced hand, and the result is a pleasant and moderately exciting novel of incident.

Braut in Haaren (20) is a pretty story of life in the mountainous districts of Germany, with sturdy honest peasants, gallant young foresters, blushing maidens, just enough villany to preserve the tale from insipidity, and a happy *dénouement* at last.

Unsere Zeit (21) has several contributions of interest, especially a review of the present condition of palæontology by Karl Vogt, significant of the general reaction against Haeckel's ultra-Darwinism; a survey of the political situation in Germany, where the writer seems inclined to despair of the Liberal cause in Parliament, and advises its supporters to rely chiefly upon the press; and an account of Hans Makart, the great contemporary Austrian painter, whose brilliancy of colouring and prodigality of invention are said to rival Rubens and Paul Veronese.

The *Rundschau* has two interesting contributions on the borderland between fiction and studies from real life (22). One, by E. Wichert, sketches the career of a political enthusiast whose heart is ultimately broken by the absorption of his own little German principality into Prussia. The other, and much more remarkable, study is a narrative by Ivan Tourgueneff, of his acquaintance with a remarkable personage, a stormy petrel of revolution, in the days of Louis Philippe and the Republic of 1848; a ragged, sinister, disreputable vagabond, with vestiges of breeding and culture, a powerful intelligence, and preternatural intuition of coming events, without the slightest power of turning them to his own purposes. So graphic is the portrait that we seem to have the very man before us. A trifling slip betrays that the translation is not from the Russian but the French. There are also a review of the Afghan expedition by an impartial looker-on, who entirely justifies the policy of the English Government; and a very interesting biography of Swammerdam, the founder of microscopic anatomy, whose scientific career was ruined by his devotion to the mystical prophetess Antoinette Bourignon.

The *Russian Review* (23) has a detail of recent archæological discoveries in the Crimea, and a piteous account of the sufferings formerly undergone by captive Russians in the Khanates of Central Asia.

OBSTRUCTION.

THE CHANCELLOR of the EXCHEQUER has every reason to be satisfied with the first night's debate on his proposed Standing Order. There may have been some ground for alternative suggestions of more rapid and vigorous action; but, as Mr. FAWCETT said, it was desirable not to exhaust the powers of the House in a first experiment. Lord HARTINGTON and the great body of the Opposition loyally supported the Government, notwithstanding a conventional objection on the ground that the Liberal leaders had not been consulted. The criticisms which Lord HARTINGTON thought proper to add were the result of the conventional habit or wish of Parliamentary opposition. The CHANCELLOR of the EXCHEQUER was fully justified in relying on the knowledge and conscience of the House, instead of undertaking to prove notorious facts by detailed evidence. Habitual misconduct by its nature consists of numerous incidents, which may all be separately trifling; but Mr. NEWDEGATE in some degree supplied Sir STAFFORD NORTHCOTE's omission by showing that Mr. PARNELL, Mr. O'DONNELL, and Major NOLAN had in the last Session made many hundred speeches. The allegation that some members of the Conservative party formerly practised obstruction on a small scale is irrelevant, even if it is true. If they had impeded the business of the House so far as to render extraordinary measures necessary, the present proposals would probably have been made by a Government which then commanded a large majority. It may be added that members of the regular Opposition are never likely to proceed to extremes, because they belong to a great party which is interested in maintaining the respect of the House. There can be no doubt that the concurrence of the Liberal leaders in the Standing Orders is politically prudent, as it is undoubtedly honest. The country would not have regarded with indifference any attempt to screen the enemies of Parliamentary freedom from the mild punishment which will follow the repetition of the offence. Mr. DILLWYN has fortunately been induced either to withdraw or to explain away an amendment to the effect that Parliament ought not to deal with the question on the eve of a dissolution. The House of Commons is bound both to maintain its own privileges during its last Session, and to hand over its powers unimpaired to the next Parliament. It is satisfactory to observe that Lord HARTINGTON expressly approved of immediate action; and Mr. DILLWYN probably deferred to the authority of his [illegible]. Some of the preliminary conversations on Thursday evening must have vividly reminded the House of the inconvenience of frivolous interruption. It remains to be seen whether the members against whom the Standing Order is avowedly directed will furnish on the present occasion superfluous illustrations of the necessity of the measure which they oppose.

Sir STAFFORD NORTHCOTE has judiciously proposed the mildest remedy for obstruction which is consistent with possible efficiency. Some of the provisions embodied in notices of private members were perhaps equally unobjectionable; but it was obviously proper that the Ministerial leader of the House should be responsible for an organic change in its procedure. It has never before been found necessary to adapt the rules of debate to the contingency of deliberate obstruction of business. During some centuries it has been possible to rely on the good faith and good breeding of members. It has now become necessary to counteract the efforts of cynical conspirators; and the task is extraordinarily difficult. Those who wish to bring Parliament into contempt would be almost as much gratified by stringent restrictions on the freedom of debate as by the exercise of unbounded license. Like the Russian Nihilists, whose enterprise is in some degree analogous to their own, they would gladly force the authority which they assail into excesses of despotism until they are able to destroy it. When the practice of obstruction first began, many proposals were made for the abolition of dilatory forms; but it appeared on fuller consideration that, in curtailing its own privileges, the House would not abate the mischief. If speeches were limited in length, they might be increased in frequency, especially as the obstructive faction constantly receives new reinforcements. It has for some time past been agreed that the internal legislation of the House against contumacious members must be personal, penal, and summary. The last condition is not the least essential. A prolonged debate on the culpability of a member accused of obstruction would serve his purpose as well as any other mode of wasting time and impeding the transaction of business. The most simple punishment which can be inflicted has the merit not only of being just and moderate, but of affording relief to the injured majority of the House. Silence imposed on a prolix brawler is at the same time a censure and a remedy. Perhaps some additional measure may be rendered necessary if the offence is repeated by accomplices, of whom there will be too many—

> *Primo avulso non deficit alter*—

but prudent legislators will incline to undue lenience rather than err on the side of severity.

There has been much difference of opinion as to the expediency of investing the Speaker or the Chairman of Committees with new judicial functions. The Speaker's powers have hitherto been almost exclusively exercised in the form of calling to order members who have transgressed the rules of debate. The mysterious process of naming a delinquent member has almost always been held in reserve; and if ulterior proceedings are necessary, the House itself must intervene. A Chairman of Committees who is thwarted in his efforts to maintain order reports the case to the House on the resumption of the chair by the Speaker. One principle and one tradition have done much to support the dignity and authority of the House of Commons. According to the ancient and undoubted doctrine, the Speaker derives all his powers from the House of which he is the servant. At the same time it is understood that the authority of the Speaker, as the accredited organ of the House, is to be supported in all cases in which he has to act on his own discretion. Few Parliamentary outrages have caused juster indignation than the rudeness to the SPEAKER which has on one or two occasions formed an incident in the course of obstruction. With a prudent jealousy of any extension of the contentious functions of the Speaker, several framers of motions have proposed to give the initiation of proceedings against obstruction to private members; but the objection at once occurs, that the obstructive faction would probably turn the proposed machinery against the supporters of order. They would find amusement in moving resolutions, perhaps against

the leader of the Ministry or of the Opposition, with the additional excitement of divisions. It is well that the magnitude of a probably necessary innovation should not be disguised. A breach of the orders of the House, or a violation of ordinary propriety of language and demeanour, is an intelligible and simple offence, though it may not admit of previous definition. Obstruction, consisting probably in purposed garrulity, aided perhaps by citation of irrelevant documents, raises questions of opinion and of degree. The Speaker will have a delicate task in distinguishing between unconscious verbosity and purposed waste of time. The culprit will probably take care not to deviate too widely from the ostensible subject of debate; and the Speaker will have to judge how far he is either reasonable or sincere. There have been Speakers to whom the proposed power could not have been safely intrusted. The verdict of the tribunal which will decide the issue will not be equally open to question. On the whole, the plan of the CHANCELLOR of the EXCHEQUER seems more expedient. No member can be charged with obstruction until the Speaker or the Chairman has first called him to order, and afterwards named him. The presiding officer will thus discharge the duty of a committing magistrate, or of a grand jury, while he will be no party to the final conviction. The House will decide on motion, following the preliminary decision of the Speaker; not according to extraneous evidence, but, as Sir H. PEEK expressed it, by instinct, or rather by its own observation and knowledge. Recent experience shows that the worst offenders may always count on the aid of a small and sympathizing minority of English members; but the great majority of the House of Commons has long been weary of the insolence of the obstructive faction, and there will be less hesitation in imposing the penalty because it is extremely mild. An offender impervious to shame will not suffer severe hardship if he is suspended for the remainder of a sitting from the abuse of his privileges as a member of the House of Commons. The consequences of relapse or of repeated convictions are not unduly formidable; and indeed it may perhaps be found that the proposed legislation is simply experimental. The complaint that it is directed against an unpopular knot of members is true in fact, because they have hitherto been the only wilful offenders. It is possible that the formal embodiment in a Standing Order of the indignation of the House of Commons, and of its determination to emancipate itself from tyrannical caprice, may produce an impression which will obviate the necessity of actual resort to measures of prevention. The time which may be occupied in the debate will not have been lost, though it might be advantageously curtailed.

RUSSIA AND GERMANY.

EVERYTHING relating to the recent attempt on the CZAR's life is wonderful. It is wonderful that the German Government should have been long ago informed that something was being prepared in the Winter Palace, that the CZAR was warned, and that the warning was disregarded. It is wonderful that an attempt to kill the CZAR by the explosion of dynamite should have been actually made. It is wonderful that the conspirators should have expected to kill the CZAR by exploding dynamite through two solid floors. In point of fact, the floor of the room in which the CZAR was expected to dine was not in the least injured. Lastly, it is more wonderful than all that, at the end of ten days, nothing apparently should be known of what was really done or of who did it. The rumour of numerous arrests having been made before the explosion is confirmed, and there are other vague rumours of arrests having been made since the explosion. But it is not even hinted that any discoveries have been made showing to whom guilt is to be imputed. Either the police cannot find out the truth or it will not. Speculation has got so far as to surmise that the police are hedging, that they think the Nihilists are going to win in the long run, and that they consider it prudent to look forward to the day when those who arrest Nihilists may in their turn be arrested. This seems rather far-fetched; but the fact remains that the police seem to be either bewildered, or to fear some rock of high influence in their way which they cannot pass. Meantime the CZAR is said to be in a state of religious excitement. He has been so marvellously preserved from the consequences of an explosion operating through two solid floors, that he considers himself to be under the special protection of Providence, and to have received a peculiar mission of indiscriminate repression. General LORIS MELIKOFF is to replace General GOURKO in the supreme command at St. Petersburg; and as Russian officials of a lower order have been found ineffectual, astute Germans are to be called in from the Baltic provinces. At the same time it is said the EMPEROR is having some mysterious edicts printed in the strictest secresy, which are to be published on next Tuesday, the anniversary of the CZAR's accession. On the same day the Nihilists are, as they have managed to announce, going to do something extraordinary. They are in some way to illuminate St. Petersburg by way of cheering society and drawing general attention to their proceedings. Idle as all these rumours may be, they are worth noticing as illustrating the state of society in which such things are possible. Russian society seems to be in a state of utter confusion. It is not so much indignant at the explosion as puzzled by it. If it has little sympathy with the authors of the attempt, it has no belief in the Government. Those who cannot protect themselves cannot, it thinks, protect others. The CZAR may hold out for the moment, but possibly next Tuesday, or a month or two later, he may give in. No one except the CZAR seems to be in any way comforted by his religious mission. Foreigners cannot pretend to be wiser than the Russians themselves, and the Russians say they are bewildered; but, so far as outward signs go, there seems much to make it probable that the CZAR has to confront not a conspiracy, but a revolution.

It is a relief to turn from the details of social life at St. Petersburg, of which we can know extremely little, to the broad and patent facts which must determine our judgment as to the position which Russia now occupies towards other European Powers, and especially towards Germany. That Russia is meditating an attack on Germany is too absurd an assumption not to revolt the common sense of the Germans themselves. All that Russia could hope for in a war with Germany would be to enter on a defensive struggle in which, by abandoning much and undergoing extreme misery, she might hope to tire the Germans out. Such a war might be successful if the Russian nation was as it was in the days of the CZAR's grandfather, extremely patriotic and passionately devoted to its sovereign. As things are, a war with Germany would be probably even more fatal to the CZAR and his dynasty than to Russia itself. Theorists urge that the CZAR might declare war against Germany merely to give a vent to the turbulent ferocity of his subjects. He has no vent to turbulent ferocity to give in this direction. All he can do for his turbulent subjects is to invite them to show the extreme of patience and endurance under tribulation, with the prospect of this patience and endurance ultimately gaining the day. How can a CZAR for whom ruffians lay mines, who is always being shot at, whose house is full of secret, or scarcely secret, enemies, for whom a state of siege does nothing, hope to win the love and fidelity of his subjects by exposing them to such a campaign as that of 1812? Sensible Germans, seeing this, also see that Prince BISMARCK's affected alarm about a Russian attack may be merely a manœuvre to carry his Army Bill. But, then, sensible Germans also go on to wonder why this tremendous machinery is brought into play merely to carry a modest Bill which could be carried anyhow. They cannot keep out of their minds the thought that perhaps Prince BISMARCK means more than he says, and is meditating how he may get Germany to attack Russia with some small sense of decency. This also is the thought that is filling Europe with anxiety. There can be no doubt that Europe is very anxious, and has become more anxious within the last few days. There are good judges who confidently predict that the present year will see a great European war. If the grounds of this prediction are examined, it will be found that they are obtained from an examination of the past history of Prince BISMARCK, and from the conviction which this past history inspires that no scruples would restrain him from striking Russia if he thought that the moment for striking had come, if he could catch Russia at a sufficient disadvantage, and could be sure that she would be sufficiently isolated.

It is announced that Prince HOHENLOHE has left Paris, and has left it in such a way that it is taken for granted that he is not to return. The PRINCE has been one of the

[illegible] supporters of a policy of generous kindness and good feeling towards France, and some apprehension is expressed in Paris of an intention on the part of Prince Bismarck to replace the friendly Ambassador by one less friendly. Nominally, however, Prince Hohenlohe is only going to Berlin in order that he may take part in the debate on the Army Bill. If his duty is to state candidly what are the feelings of France in regard to war, he will have nothing to say except that France has not the remotest intention of making war, or the slightest wish to make war. The French ask for nothing but to be left alone, and to see no European questions raised that would force them to encounter risks from which they shrink. The only important foreign question with which the French Government now has to deal is that of the extradition of Hartmann, who is said to have been a party to the plot for murdering the Czar by upsetting the train at Moscow by which he was travelling. The difficulty in which the French Government finds itself has been much increased by the threat of the Russian Ambassador that he will leave Paris if the extradition is refused. Such a threat is very unwarranted and offensive, but at any rate it might be supposed to put an end to suspicions of any dangerous intimacy between Russia and France. In Austria there is certainly no disposition for war or adventure, and the debates on the Hungarian budget show that, far from there being any willingness to wreck the national finance by ruinous military enterprise, there is a jealous disposition to cut down to the last possible florin the cost of the Bosnian occupation. Nor is there any ardour for war in Germany itself. The Germans are an essentially pacific people and do not like war. The German Emperor, too, takes every opportunity of showing that he retains all his old feelings of affection for the Russian Imperial family. But experience has only too amply shown that neither the German people nor the German Emperor can stop Prince Bismarck when he has once decided firmly on anything. As to whether he has decided on war, speculation is vain. There are signs that point one way, and signs that point another way. One day a Ministerial paper inserts a flaming article intended to provoke and alarm Germany by pointing out that Russia is most unhandsomely fortifying her Polish frontier. The next day the same paper inserts a soothing communication, pointing out with unanswerable force that the Eastern frontier of Germany bristles with fortresses, and that Russia is as much at liberty to build her fortresses as Germany was to build hers. Next week the situation may not improbably be cleared, for Prince Bismarck is himself to speak on the Army Bill, and he must make some exposition of his policy. Meantime Europe is in the undignified position of a culprit waiting to hear his doom. Not improbably the supreme judge of Europe will refrain from pronouncing sentence against any one, and will content himself with parading the awful powers he has at his command should he ever think it necessary to exercise them.

AFGHAN POLICY OF THE GOVERNMENT.

THE Indian Correspondents who record the changes in public opinion or in their own have retracted their complaints that the Government has not announced its Afghan policy. It would be difficult to publish a decision which it has been hitherto impossible to form; but it may be inferred from intimations given in the late debate that the policy of allowing the dissolution of the unity of the Afghan kingdom has been considered. The military difficulties have, it may be hoped, been nearly overcome. Ghuznee appears to be incapable of resisting a regular attack; and it is not certain that it will be necessary to reduce the place by force. Letters between Sir F. Roberts and Mahomed Jan are said to have crossed on the road, and it may be inferred that the insurgent chief is inclined to negotiation; but he is said to have advanced the inadmissible pretension that he should meet Sir F. Roberts on neutral ground. It will be impossible to recognize his affectation of equality, or to allow that any Afghan territory is neutral. Until the details of the negotiation are known, the Indian Government must be supposed capable of maintaining its own dignity. No leader of high rank at present offers open resistance; for, contrary to expectation, Abdurrahman seems not yet to have entered Afghan territory. The Sirdars probably differ in opinion as to the expediency of maintaining the unity of the kingdom. Some of them may perhaps prefer local independence, while others may be disposed to concur in the nomination of some real or nominal ruler. The Indian Government would recognize any Ameer who was known to represent the Afghan chiefs, on condition of his consenting to the guarantees of fidelity and deference which will necessarily be required. Any arrangement of the kind will involve many difficulties, but it is only possible to choose among conflicting embarrassments. The selection of the infant son of Yakoob Khan would involve the appointment of a regency, which, if it could otherwise be trusted, would involve a claim to permanent protection. No satisfactory scheme of dealing with the provincial capitals has yet been devised. The governor and chiefs of Candahar, who have thus far loyally supported the English authorities, might not be willing to recognize an Ameer reigning at Cabul; and a strong pressure is placed on the Government to retain permanent possession of Candahar. Sir H. Rawlinson long ago recommended the occupation of the city as a better military position than Cabul. If the railway which is now in progress is completed, it is almost certain that Candahar will be, directly or indirectly, governed as an English dependency.

It is much more difficult to determine the disposal of Herat. The domestic controversy is simplified by Lord Northbrook's admission that Herat cannot be allowed to pass into the possession of Russia. The Government, sharing the same conviction, is evidently hesitating among two or more modes of guarding against the danger. It would be possible to take the place by an advance from Candahar, and to hold it against foreign or domestic assailants; but the expedition would be long and costly; and there are strong objections to the maintenance of a garrison some hundreds of miles from the Indian frontier. An English force could not be spared for the purpose unless the strength of the army in India was permanently increased; and it is not desirable to strain the loyalty of native troops by compelling them to serve in distant countries and in an unfamiliar climate. From the date of the last Persian war to the death or flight of Shere Ali, the difficulty was reduced to its lowest point by the Afghan occupation of Herat. The place is now in the hands of one or more practically independent chiefs, who might perhaps be induced to accept Russian protection. In these circumstances Sir H. Rawlinson anticipated the Government by recommending a reversal of the former policy in which he was actively concerned. He thinks that Herat might be placed under the sovereignty of Persia on condition of an alliance which would be directed against Russia. It seems that on the Persian side no objection would be raised if only sufficient guarantees were offered against the probable effects of Russian resentment. The Northern provinces of Persia could not be defended against Russia; but Sir H. Rawlinson observes that the Southern provinces and the sea-coast would be equally accessible to English troops. In the conflict for dominion and influence, the condition of a weak State interposed between two great Powers would not be enviable. It is not certain whether the Government may not have desired to arrange with Russia the terms on which Herat might be given over to Persia. It is certain that the scheme was first openly proposed in Russian journals, though the same writers have since felt or affected indignation at the rumour of English negotiations tending to the same result. The plan which Prince Lobanoff is supposed to have brought with him for a general accommodation of differences between England and Russia may perhaps, if it is hereafter disclosed, throw some light on the Herat negotiations. Any such overtures, if they are made, though they must be watched with jealous vigilance, ought not to be summarily rejected. Even if it were reasonable to doubt whether Russia could be trusted to observe a formal compact, the breach of an agreement would simplify some existing complications, or at the worst, it would remit both parties to their present positions.

Lord Northbrook's declaration as to the importance of Herat was not his only contribution during last week's debate to the elucidation of the Afghan controversy. It may indeed be said that his speech offered a retrospective justification of the Duke of Argyll's ill-timed motion. It was wholly unnecessary to renew the exhausted controversy as to the effect on Shere Ali's mind of the [illegible]

and scanty promises of support which were extracted from the Viceroy after he had been warned against undue concession by the Secretary of State. It has been again and again shown that Lord NORTHBROOK was in the first instance inclined to give comparatively strong assurances, and that the Duke of ARGYLL checked his liberality. The promises which the Viceroy made orally to the Afghan Envoy were partially revoked or restricted by his statement in a letter to the Ameer, that the matter would be most conveniently arranged at a future time. The impression produced by the letter is authentically recorded in SHERE ALI's ironical acknowledgment of the communication. He said that he was duly grateful for the undertaking to continue the policy of former Viceroys, but he added, "My "friend, it was in those circumstances not worth my "while to send an Envoy to Simla." The Duke of ARGYLL admits that from that time the Ameer was, as he said, sulky. According to the Government, he is more accurately described as having from 1873 been alienated from England, and inclined to court the protection of Russia. The Duke of ARGYLL forgot to redeem a pledge that he would explain his reasons for asking the Government to produce the Russian correspondence found in Cabul. On the intimation that the publication would not be for the public interest, he properly withdrew his demand; and it may be added that throughout his speech he abstained from the vituperative language which he had been tempted to employ in his book and in some former speeches. An orator of genuine eloquence has no excuse for the violence by which inferior speakers sometimes seek to escape from dulness.

Lord NORTHBROOK makes no pretension to eloquence, but his speech commanded the attention which is always paid in either House to those whose knowledge and judgment are entitled to respect. While he adhered to his former opinion that the rupture with SHERE ALI was unnecessary and injudicious, he showed that he was aware of the irrevocable nature of a completed fact. Lord NORTHBROOK approves of the maintenance of control over the frontier tribes; and he must therefore admit the necessity of holding the advanced frontier, though he would not approve of the retention of Candahar. Lord NORTHBROOK's speech, notwithstanding his antagonism to the Government, has had the effect of reminding the country that complex questions of diplomacy and war are not to be disposed of by one-sided declamation. Sir H. RAWLINSON's remarkable paper has probably promoted the growing disposition to aid and advise the Government, instead of rejoicing in its real or alleged discomfitures. His almost unqualified approval of the Treaty of Gundamuk and of the conduct of both campaigns will have exercised much influence on general opinion. It is well known that Sir H. RAWLINSON has never been a political supporter of the present Ministers; but, since the partial subsidence of factious excitement, it has become intelligible that a statesman may prefer the safety of the Empire to the triumph of a party. Within a few days several Liberal members have publicly condemned the agitation which has been directed against the foreign and Indian policy of the Government, and there is no reason to suppose that the constituencies which they address are more factious than their representatives. The settlement of Afghanistan and the security of Herat have no material connexion with domestic politics; and the solution of difficult problems will not be facilitated by systematic attacks on the Government. Even if mistakes are committed, the nation is necessarily represented by its agents. Their failure may be due to their own fault, but it is the misfortune of their principal. Their reputation will largely depend on the ultimate triumph or defeat of their policy; but efforts to thwart them at every stage of the undertaking only diminish their chances of success. As it may be presumed that their most hostile critics would not urge the immediate evacuation of Afghanistan, it only remains to consider the best means of prosecuting the enterprise.

LAW REFORM.

MEASURES of Law Reform are to be the main, or it may almost be said the sole, work of the Government this Session in the sphere of legislation. The measures they propose have the merit of being really needed, well directed, and well shaped. But unfortunately even the Government is far from sanguine as to its power of carrying what it proposes, and Parliament, although professing its usual anxiety to do its best to reform the law, also shows its usual indifference as regards subjects which it does not understand and which do not interest it. The Bankruptcy Bill alone has an almost assured prospect of becoming law. It is substantially the Bill of last Session, and has been sent to a Select Committee. An alteration in the law of Bankruptcy is urgently demanded by the mercantile community, and the Bill of the ATTORNEY-GENERAL undoubtedly remedies many of the defects of the present system. When it gets before the House the Bill is sure to be attacked on the ground that the present system is radically wrong, inasmuch as it is designed to facilitate bankruptcy. That it is a good thing in itself, provided proper precautions against fraud and collusion are taken, to give a person who cannot pay his debts quite a fresh start in the world is the assumption on which the present system is based; and this assumption will be contested, for reasons which will deserve consideration. But, when once this preliminary objection—which is one of principle—is disposed of, and Parliament decides to work on the present lines, the details of the Bill ought not to provoke any long discussion or persistent opposition. The Criminal Code has a much less hopeful future before it. In fact, the ATTORNEY-GENERAL confessed that it was idle to think of getting it passed in one Session. All he now dreams of is that, if it were cut up into little bits, some of the little bits might be passed this Session, and more little bits might be passed another Session, so that in an unknown number of years the whole might be got through. This may be unavoidable, but it is very disheartening. The ATTORNEY-GENERAL described the enormous pains which had been taken to make the draft Code as perfect as possible. One of the results of the care that has been expended is that the different parts of the Code hang together. From first to last every part is treated as part of a whole; and it is difficult to see how any of the little bits into which the Bill is to be divided can have, if isolated, anything like the value which it was meant to have by those who placed the other little bits in conjunction with it. But, when the ATTORNEY-GENERAL says that there really is no chance of the Bill being passed as a whole, there is no answer. The difficulties in his way are only too obvious. He was followed by two speakers, one on each side of the House, who contended that no Code at all was wanted. The Bill inevitably introduces many changes in the law, and these changes will be warmly opposed. Further, while the Bill does not affect Scotland it does affect Ireland, and the obstacles which national jealousies may interpose are not among the least serious which the ATTORNEY-GENERAL has to contemplate.

The CHANCELLOR on Monday night submitted to the House of Lords a long series of law reforms. Every one of these reforms deals with matters of practical importance, and is designed to further some recognized public interest. Within the limits of change which the CHANCELLOR is, from the general cast of his mind and his habits of thought, willing to accept, the measures proposed are bold, comprehensive, and effectual. They also bear the impress of the long and painful care bestowed on them, and show at once a grasp of principles and a mastery of technicalities. But measures of Law Reform submitted to the Lords by the CHANCELLOR are unhappily to be considered rather as contributions to the formation of sound opinion in the future than as anticipations of what will immediately become law. The CHANCELLOR is guiding in the right road the profession of which he is the head, and also the public so far as the public may deem itself to be capable of comprehending his views. So much he is sure of doing. As to getting the House of Commons in its last Session to trouble itself about the twenty heads of justifiable improvement at which the CHANCELLOR, after an exhaustive study has arrived, that is probably nothing more than a beautiful dream. But the chief of the CHANCELLOR's measures is one so moderate, so justly conceived, and so very advantageous to the public, that even the House of Commons in its present exhausted and prostrated state might possibly be persuaded to spare for it a little of the time which would otherwise be wasted. The aim of the measure, briefly stated, is to make the tenant for life of land the full owner for the purposes of sale, and for the purposes of long leasing. He is to be able to dispose of

his estate as if he really owned it. The land that would come into the market if he were the unrestricted owner, the houses that would be built, the mines that would be opened, may come into the market, be built, or opened, although he is merely the tenant for life. This is only an extension—although an extension equally bold and salutary—of recognized principles of English law. The general principle of English law is that land is to be looked on like any other property. It may be tied up to the same extent, but no more; it may be settled and given by will exactly as Consols may be settled or given. The one exceptional difference is in the case of intestate succession. But English law also recognizes that the public is interested in the mode in which land is held. Precautions of an almost excessive scrupulosity guard against land coming too easily into what is technically known as the "dead hand"; and measures have already been passed with the object of enabling the trustees of settlements to sell land of which they are the nominal owners. But trustees, although they may sell, are generally not at all inclined to sell. It is not their shoe that is pinched by land not being sold. It is the tenant for life that longs to sell one part of his estate so that he may improve another part; who wants to see houses built or mines opened on his land; who feels the weight of charges in times of distress; or who longs to escape from the precarious dignity of an impoverished landowner into the sweet, unostentatious repose enjoyed by the holder of Three per Cents. To substitute the tenant for life who wishes to do something for trustees who wish to do nothing, and at the same time to give him powers which trustees rarely possess, is the simple but most commendable object of the CHANCELLOR's measure.

The new position of the tenant for life is of course to be hedged round by some necessary safeguards. Under existing settlements the consent of the Chancery Division will be necessary. Under future settlements the tenant for life is to be at liberty to sell if his trustees do not object; if they object, he can appeal to the Court. He will not be able unless in very exceptional cases to sell the family mansion-house. When his land is sold, the proceeds of the sale will be kept in Consols, or in other securities permitted by the settlement, unless other land is bought or improvements falling under one of the twenty specified heads are to be made on some portion of the land that remains in settlement or has been brought under it. These are minor details, and only need notice to show how carefully all the consequences of the main principle being accepted have been thought out and worked out by those who framed the Bill. It is the general results of the measure that claim attention, and these results are that a large amount of land will be marketable which now is not marketable, that another large amount of land which is not sold will be greatly improved, and that the person who seems to the world to be the owner of an estate will feel himself to be the owner, and will be able seriously to consider how he may best improve the position of himself and his family. This, however, is not the only measure of the CHANCELLOR which will have an important bearing on the character of land as a marketable commodity. He has ventured to suggest a revolution in conveyancing. To make English deeds at once simple and effectual is a very arduous task, but it is one to fulfil which the CHANCELLOR thinks the mind of man is perhaps not unequal. But then, if deeds are to be short and intelligible, how are solicitors to live? By paying them, the CHANCELLOR answers, not according to the length of deeds, but according to the real services they render. If the client knows that the cost of conveyance will amount to a fixed sum according to the value of the land conveyed, he will be very happy, and his solicitor, if he gets as much money, will be no more unhappy than he is now. There is nothing new in this suggestion. What is new is that a Chancellor should make it. Experts have long been aware that the proper method of paying solicitors lay at the root of all reforms in the language of conveyancing; but this reform has got into the region of possibility now that a Chancellor has determined by a Bill how solicitors shall be paid. A fourth measure limits the time in which actions may be brought, and it would no doubt be a considerable convenience if claims of the ordinary kind could not be brought after three years had expired, instead of the period being, as now, fixed at six years. But although this may be a good hint in a small way for future legislation, still the two chief aims of the CHANCELLOR—that of putting the tenant for life in, or very nearly in, the position of the full owner, for all the purposes of selling or improving land, and that of substituting ordinary English for the curious language of conveyancing, through adopting the right method of paying solicitors—must be retained in the memory as the really prominent parts of Lord CAIRNS's scheme of law reform.

THE INDIAN BUDGET.

OPPOSITION orators committed an unfortunate error in tactics when they selected Indian finance as an illustration of the incapacity, or at any rate the ill success, of the present rulers of the country. Hardly had the plaudits of Midlothian audiences died away, when the secret escaped that, so far as an English Ministry can claim credit or deserve blame in respect of the revenues of India, the Government were in a position to give an unanswerable reply to hostile criticism. The results now officially declared show that the Finance Minister was speaking well within the mark when, a few weeks ago, he asserted his conviction of the substantial soundness of the position. "I feel satisfied," Sir JOHN STRACHEY said, "that India will be able to bear her own proper burdens. "I see much that is encouraging and satisfactory in the "condition and prospects of her finances, and no cause "whatever for despondency." We now know the grounds of this cheerful language. Not only is it not true that India is bankrupt, or on the eve of becoming so, but she is shown to be in possession of resources which place her, as regards solvency, in an exceptionally high position among the nations of the world. During the last four years she has been exposed to a combination of troubles serious enough to explain prolonged embarrassment. Famines have involved an expenditure of ten millions, the fall in exchange has cost eleven millions more, the Afghan war another four millions; at the same time the widely-extended and long-continued distress in the South of India seriously affected several important branches of revenue and checked the natural development of trade. Above all these difficulties, however, the Indian Exchequer rises triumphant. Instead of a deficit of nearly 1½ millions, which was anticipated last spring, the present financial year closes with a surplus of 119,000*l.*, after every ordinary expense has been met and 3¼ millions have been devoted to war, and more than 1½ millions to strategical railways. The realized result has, in fact, improved on the estimate to the extent of five millions. Nor is this the windfall of a single lucky year. In 1880-1 Sir JOHN STRACHEY hopes to end with a surplus of 417,000*l.*, after spending 2 millions on the war and 2½ millions on strategical railways, thus providing another surplus on normal expenditure of the year of 4⅞ millions, making a total surplus for the two years little short of ten millions.

It is true that these agreeable results depend in no small degree on causes which are beyond control. No one can do more than make a rough guess at the profits on the sale of opium, which this year has helped the Indian exchequer to the extent of nearly two millions beyond the expected figure. The course of exchange, too, defies calculation; and the million which has been saved by the improvement of this year's rates might easily have had to be entered on the other side of the account. The improvement of half a million in land revenue and 362,000*l.* in salt is more satisfactory, as attesting, in unmistakable language, the recovery of the famine-stricken populations from the depression produced by their long trial. The saving of 660,000*l.* on public works, and the reduction of the annual outlay in future years under this head to 2½ millions, must be regarded with less unqualified satisfaction. The retrenchment has, it is well known, been forced on the Government by the agitation of which Mr. FAWCETT is the most conspicuous promoter, and is that part of the existing arrangements from which it is probable that the improved position will be first utilized to effect an escape. As Sir JOHN STRACHEY observed, the curtailment has materially checked the efforts of the Indian Government to protect the country from famine by the construction of cheap railways and canals. The real position and prospects of these undertakings are but imperfectly understood by the English public and the amateur exponents of Indian affairs who profess to instruct it. But the Report of the East India Public Works Committee last autumn placed beyond all reasonable

doubt the conclusion that the scheme of outlay on productive public works, on which the Government of India has for some years past been engaged, was judiciously framed in the first instance and has more than realized the expectations of its founders. The Committee found that, whereas 94 millions had been laid out on railways in 1872, with the result of an annual loss in interest of 2,324,000*l.*, the development has been such that, in 1877–78, 114 millions had been laid out with a resulting gain to Government of 65,000*l.*, instead of a loss of nearly 2 millions for which the forecast provided. Of the 17½ millions laid out in works of irrigation, 5½ millions had been invested in works which were sufficient to earn a net surplus of half a million for the Government, besides interest and working expenses. The remaining works, amounting to 10 millions of capital, are in many instances undeveloped or even still under construction; and at present they fall short by 421,000*l.* of paying the accruing interest on their capital. Here, however, as with the railways, there is not the least ground for doubting that the money has been wisely invested, and that the scheme will ultimately prove as remunerative to the State as it has already proved to the landholders. As interruption and delay in a well-conceived project necessarily occasion additional expense, and as in the present instance the postponement involves also the prolonged exposure of large parts of the country to the horrors of famine, it is a matter of regret that ill-considered and ignorant criticism should so far have prevailed over the mature results of experience and foresight as to arrest the completion of many half-finished undertakings, and postpone to an indefinite future many others which, from every point of view, commercial no less than philanthropic, were full of promise. Mr. HYNDMAN, and those who join with him in exulting over the curtailment of Indian public works, would probably be startled to learn that the necessary result of this change of policy is that the protection of the people of India from famine is appreciably further from attainment than it might otherwise have been.

The abolition of the insignificant export duties on lakh and indigo, amounting to 54,000*l.*, is of importance only as a pledge of the continued efforts of the Indian Government in the direction of fiscal reform. India has now swept her tariff clear of every export duty except that on rice, which is justified by the circumstance that Indian rice has a practical monopoly in the English market, and that the exporting districts are among the most prosperous in the country. The changes in the cotton duties effected last spring, however open to criticism on the score of inopportuneness, have at any rate resulted in a material addition to the clothing of the population; and the dissentient members of the VICEROY's Council will probably, under existing circumstances, cease to lament the failure of their endeavour to benefit a small class of mill-owners at the expense of the entire community. Though no further extension of Free-trade policy is conceded during the present year, the Government of India is pledged to lose no opportunity of reducing an impost which, from an Indian no less than an English view, is open to serious objection. In the meantime there is no room for doubting that the millions of India are already reaping the benefit of unrestricted commerce in the cheaper and more abundant supply of a prime necessity of existence. There is every reason to hope that the general improvement of revenue may eventually render the Indian Government altogether independent of Customs duties. Among other projected economies is the reform of the present obsolete, cumbrous and meaningless system of provincial Commanders-in-chief. The Army Commission, Sir JOHN STRACHEY informs us, has suggested a saving of 1¼ million in this and other forms of military extravagance.

The results of the present Budget of course amply justify the policy initiated two years ago for increasing the annual revenues of India sufficiently to provide for occasional outlay on famine relief. The programme has been satisfactorily carried out, notwithstanding the exceptional difficulties of the last two years. In 1877–8 half a million was expended on famine, and a surplus of 1,300,000*l.* provided for investment in productive public works, thereby reducing in a corresponding amount the sum which would otherwise have been borrowed on this account. In 1879–80 the prospect of a still more serious fall in exchange imposed on the Government the necessity of providing additional funds more than equivalent to the proceeds of the recently imposed taxation. Pending the arrangements for meeting this new difficulty, it became true that "the insurance provided against future famine had "virtually ceased to exist"—an unfortunate phrase, which has been the subject of no little misconception. The necessary retrenchments, however, were speedily carried out, and the prescribed margin of income over expenditure was re-established. Meantime, unexpected improvements in the position occurred, and the result has been a surplus far in excess of anything which the Government had pledged itself to provide, or which could reasonably have been suggested as necessary. No country—certainly no country so poor as India—can be expected to carry on war, provide strategical railways, and, at the same time, to show a surplus of something like five millions per annum on its normal income. Under the circumstances the question most pressing on the Finance Minister must be as to the direction in which it is most expedient to afford relief to the taxpayer. No one can doubt the wisdom of saving two millions of comparatively petty traders from the annoyance of direct taxation, the aggregate profits of which were only 340,000*l.*; nor need we grudge the official and professional classes their escape from the privilege of contributing to an overflowing exchequer. Englishmen—always excepting that class of politicians which has become conspicuous for its contempt of all but party considerations—will rejoice in the ascertained prosperity of England's greatest dependency, in the close of a period of anxiety and suffering to vast multitudes of mankind, and in the effectual refutation of gloomy forebodings now shown to be nothing more than the chimeras of insufficient information and superficial thought. The VICEROY and his extremely able Finance Minister may alike be congratulated on a page of Indian history in which not even Liberal partisanship will be able to find material for censure.

BREACH OF PRIVILEGE.

ALTHOUGH the CHANCELLOR of the EXCHEQUER perhaps erred in judgment when he pressed his resolution on breach of privilege after Mr. PLIMSOLL's apology, the subsequent attempt to reduce the decision of the House to an absurdity was utterly futile. Sir W. HARCOURT on both occasions committed a graver mistake than that of which he accused Sir STAFFORD NORTHCOTE. It is true that, as he suggested, Parliamentary privilege is vague and elastic, and liable to be impaired by formal definition; but it scarcely follows that it ought never to be invoked, or that the offences denounced by Mr. SULLIVAN were in the smallest degree analogous to Mr. PLIMSOLL's interference with Parliamentary freedom. Obsolete precedents may be found to support the proposition that attacks on members are necessarily breaches of privilege; but, as modern political controversy consists to a great extent of vituperation of opponents, it is impossible to call orators or journalists to account for their compliance with the prevalent custom. When a Conservative orator at a public meeting had the bad taste to call the Home Rule members a gang of rebels, Mr. SULLIVAN, though he might justly be offended, would probably not have brought the attack under the notice of the House of Commons, except by way of retaliation for Sir S. NORTHCOTE's motion. Another Irish member proposed that half a dozen leading articles should be read at the table, though they would have been equivalent to as many more or less effective speeches against obstruction. Mr. SULLIVAN committed a blunder in protesting against the attendance of a peer at a meeting called, amongst other objects, in promotion of the interests of certain Parliamentary candidates. The CHANCELLOR of the EXCHEQUER, by a happy slip of the tongue, defended the conduct of Lord ROSEBERY; and he might have referred to a vehement speech delivered at Leeds by the Duke of ARGYLL in support of two Liberal candidates for the neighbouring division of the West Riding. Mr. SULLIVAN and his friends were not denounced as rebels for the purpose of impeding their action in the House of Commons, but by way of general dislike, and consequent abuse. Many of them habitually use language not less violent when they have occasion to comment on English statesmen, on Irish landlords, or on the other numerous objects of their patriotic animosity. A higher authority may be quoted in vindication of the right of invective. Mr.

Gladstone never makes a speech without describing the Ministers, who are all members of one or the other House of Parliament, as criminals at least as bad as rebels; but none of his victims appeal to privilege against his conscientious conviction that it is sinful to differ from himself. As he says in his lately published letter, "The "first and highest of all tests to be applied to a National "Church is its tendency to promote a sound moral "opinion, or what we"—that is, Mr. Gladstone and those who agree with him—"think to be so." It is perhaps a breach of privilege to consider the policy of the majority of the House of Commons as incompatible with sound morality.

Both Mr. Sullivan and his friendly opponent, Sir W. Harcourt, intended to propound the more than questionable doctrine that the House ought either to assert its privileges on all occasions, or cease to exercise any check on the license of its members or of strangers. On both occasions Sir W. Harcourt moved the same amendment, to the effect that the House saw no cause to take further proceedings. The resolution may perhaps have been in both instances judiciously framed; but the arguments by which it was supported went too far, and the comparison between Mr. Plimsoll's placards and the speeches at the Chelsea meeting was thoroughly misleading. Freedom of debate and independence in legislation are not menaced by the speeches of Mr. Gladstone and Mr. Bright, nor by the rival extravagance of humbler speakers on the other side. A direct appeal to the constituents of a member against his conduct in relation to a pending Bill is an interference with the freedom of the House of Commons. In times of excitement such placards as Mr. Plimsoll's might not improbably cause personal danger to the supporters of an unpopular measure or amendment. A mob would not recognize its own ridiculous incompetence to judge whether a Bill ought or ought not to come on as unopposed after a certain hour in the night. The debate which has since taken place on Lord Sandon's motion to refer Mr. Plimsoll's Bill to a Select Committee furnishes an additional illustration of the necessity of guarding against the repetition of similar irregularities. It may well have been on the whole expedient to accept a retractation as a sufficient settlement of the question; but Sir W. Harcourt's contention that the placards were no more censurable than an ordinary party speech was wholly erroneous.

Parliament will be well advised in retaining all the means of defence which have been provided at different times in contemplation of varying circumstances. Even the power of prohibiting the publication of reports of debates might in possible contingencies be useful; and in the meantime a rusty weapon does no harm while it hangs on the wall. It is to be regretted that modern ingenuity has not devised a remedy against the opposite risk of the suppression of reports. It would perhaps not be possible to summon to the bar of the House publishers of morning papers in which the summaries of speeches were fuller than the reports. Against more positive interference with the supremacy of Parliament, privilege and the penalties by which it is enforced will probably afford sufficient protection. There is no sufficient reason against relinquishing a few definite and personal privileges which were once necessary for the protection of members. Two hundred years ago it was not impossible that a member might be arrested on the pretence of debt for the purpose of preventing him from joining in an obnoxious vote. As debtors can now only be imprisoned after a contumacious refusal to pay a just debt, it is unnecessary to continue an obnoxious, though insignificant, exemption. The peer who some time since refused with impunity to pay a small coal bill cannot be said to have represented the usual practice of his order. It is remarkable that in England members of Parliament have never claimed relief from liability to criminal prosecution. Continental Assemblies have in general a right to give or withhold their assent to the prosecution of their members. At the present time two Socialist representatives are claiming the protection of the German Parliament against political prosecutions. It was not necessary to ask the consent of the House of Commons when O'Connell was prosecuted for sedition five-and-thirty years ago. Although party feeling then ran high, the Opposition never affected to believe that the object of the Government was to exclude a formidable adversary from Parliament. It matters little whether the privilege is maintained or surrendered. Obstinate defendants in County Courts are not likely to feel as a practical grievance the possible avoidance of imprisonment by one of their number who might happen to have a seat in Parliament. It seems strange that, while serious legislation is at a standstill, time can be found for the discussion of such trifles as the exemption of members from arrest.

As long as no interference with Parliamentary legislation or business is attempted, the characters of Ministers and members of the Opposition must take care of themselves, except in cases where protection is afforded under the law of libel; yet it would be imprudent in either House to renounce the right of dealing by its own authority with attacks which threatened its independence. Even the most sweeping charges against the whole House must be borne with equanimity. The present Parliament has been more than once informed by Mr. Gladstone, Mr. Chamberlain, and others that it is the most servile and corrupt which has been known in England since the days of Walpole, or from a much earlier period. The House of Commons has not been terrified by objurgation, and apparently it has in no respect changed its course. The Government still commands the support of its original majority, and some Liberals are disposed to condone its unexampled crimes. If agitators exchanged vague abuse for appeals to physical force, it would be necessary to resort to the comprehensive armoury of privilege. Politicians of Sir W. Harcourt's rank, whose influence in the country is the honourable result of their position in the House of Commons, are not well advised in exposing to odium or ridicule the latent resources of Parliamentary authority. It was scarcely legitimate to taunt Sir Stafford Northcote with his alleged encouragement of Mr. Sullivan's contrivance for wasting time. It has been shown that there was no analogy between the breach of privilege which had been recorded and censured by the House and the out-of-door speeches which were supposed to move Mr. Sullivan's indignation. A much slighter excuse would have sufficed for the interruption of serious business. The innumerable amendments and debates on the Irish Relief Bill were not provoked by any proceeding with reference to privilege. It may be admitted that questions of privilege should not be lightly or frequently raised. Parliamentary leaders always wisely discourage demands made by sensitive members for the punishment of journalists who may have treated them with disrespect. When there has been a real interference with the freedom of debate or with the exercise of the functions of Parliament, the offence ought not to be treated with levity. Abuse of the forms of the House by its own members is an offence of an entirely different character from breach of privilege. The internal dangers by which the House of Commons is threatened are by far the most serious; but it is also proper and prudent to provide against external encroachment, and especially against attempts to transfer legislative power from Parliament to any section of the community.

M. ROUHER ON FREE TRADE.

THE reception given to M. Rouher's speech on the Tariff Bill by the Chamber of Deputies might read more than one lesson to French parties if they were in the mood to listen to any lesson. So far as their adversaries are concerned, triumphant majorities are usually Sadducees. They believe that there is no such thing as a political resurrection. But whenever their adversaries are worth anything, it usually turns out in the end that defeat and destruction are not at all the same thing. Nothing could seem more hopeless than the position of the Bonapartists after Sedan, and yet since then they have had two revivals and two reverses. Under Marshal MacMahon they obtained for a time something like the supreme control of affairs, and though this was lost by the breakdown of the attempt of the 16th May, the blow fell more heavily upon the Royalists than upon the Imperialists. The Duke of Broglie came in for a far larger measure of unpopularity than M. de Fourtou, though it is probable that M. de Fourtou had done more to deserve the lion's share. The steady advance of the Republic in the direction of Radicalism had done much to revive Bonapartist prospects, when they were again clouded by the death of Prince Louis Napoleon. Perhaps the belief that M. Rouher, at all events, has been rendered harmless by this disaster may have had some-

thing to do with the attention paid to him on Saturday and Monday. It is more probable, however, that this attention was a genuine tribute to his great knowledge of the subject, and a half-unconscious admission that on the material prosperity of France a Bonapartist has a right to be listened to. Little as NAPOLEON III. knew how to turn national prosperity to account, there can be no question that the country did make immense progress under his rule, and that the secret of this progress lay in the sound views which he and his advisers entertained of the causes which make a nation prosperous. By a large number of Frenchmen this fact will always be set against the many vices of the Second Empire, and if the Republic is not careful to study the causes of national prosperity with equal zeal and equal success, this fact will undoubtedly be held in time to outweigh those vices. The truth is that the Bonapartists when in power have shown themselves the least vindictive of French parties. They have done all that they thought necessary, and often far more than was really necessary, to keep power in their own hands; but they have not yielded in anything like the same degree as either Royalists or Republicans to the peculiarly French desire to trample on a fallen enemy. The consequence is that they have had time and thought to spare for other things. The Republicans, unfortunately, have their attention so much taken up with the imposition of what they hold to be necessary disabilities on the Church that they cannot always give the necessary care to purely secular considerations. Some grand question of principle is constantly turning up, and the Republican Government has at once to put aside its proper work in order to devise a new bridle for the clergy or the religious orders. Many of M. ROUHER's readers will sigh as they remember how seldom such speeches as his are heard now. Imports and exports, manufactures and raw materials—these, they will say, are the words we should like to hear continually from our representatives. As it is, they are much more occupied in proving to us that, when they shut up the schools to which we wish to send our children, they are promoting liberty of education. It may be a long time before such comparisons injure a fairly strong Government, but they do tend to injure it. They alienate the classes which are the natural supports of every established Government—the classes which, if the Government is only decently prudent, have everything to lose by change. After all, it is by their care for the material interests of their subjects that Governments will ordinarily be judged. They may have higher qualities than this, but none which come so frequently before their subjects' eyes, or which live so long in their subjects' memories. The persistence shown by NAPOLEON III. in setting free the trade of France in the teeth of the Liberal Opposition wins elections for the BONAPARTES twenty years after the occasion on which it was most prominently displayed.

M. ROUHER's line of argument was very much the same as that taken by Mr. BOURKE in the late debate on Mr. WHEELHOUSE's motion. All the signs of prosperity which on the Protectionist showing ought to be wanting are obtrusively present. If the Commercial Treaty has been so disastrous to French trade, the traces of its mischievous influence ought to be visible in every department whether of commerce or industry. There should be less money saved, less money made by the railways which live in part by the carriage of goods, less money paid to the State in taxes. Under all these heads the evidence of facts goes the other way. The deposits which represent the surplus wealth of the population have increased. The earnings of the railway Companies, which represent either the business which produces wealth or the uses to which it is put when produced, have increased. The produce of the succession duties, which best of all represent realized property, has increased. These are the facts which constitute the indirect proof of M. ROUHER's case; and, besides these, there is the direct proof yielded by the actual figures which show what trade was before the Commercial Treaty, and what it has become since. When French manufacturers complain that they stand in need of more protection, they do not consider what the reduction of the protection they formerly enjoyed has brought them in. In 1850 the value of raw materials imported was 727,000,000 francs; in 1876 it was 2,185,000,000 francs. Why was all this additional raw material brought into the country? Not to lie idle in docks and warehouses, but to be used for purposes of manufacture. If the cotton industry, the wool industry, the silk industry, had been reduced to such straits as the protectionists contend, why did they go on paying more and more every year for raw materials, and where did they find the money they paid? In the textile industries alone, the value of the whole import of raw materials of every kind is nearly doubled by the process of manufacture, and this represents but part of the gain which has accrued to French trade. M. ROUHER had even a more telling piece of evidence to produce in the fact that France exports 700,000,000 francs more to European markets than England exports. She is able, that is, to beat the very country in whose interest, according to the protectionists, the Commercial Treaty was made.

Of course these figures will not convince the protectionist agitators. They do not look at Protection as a whole and at Free-trade as a whole, and set the results of the two systems against one another. Their plan is to accept the good results of Free-trade as part of the order of nature, but to regard its drawbacks as entirely due to the cruel action of the Government. The increase in the import of raw materials seems to them nothing to the purpose. They have lived, and in order to live they must of course have had raw materials to work up for their livelihood. What annoys them is that, if there had been protective duties on their manufactures, they might have worked up these raw materials at a much greater profit. They would not have needed, as now, to lower their prices in order to avoid being undersold by the foreigner. They might have undersold the foreigner and kept up their prices at the same time. A man who thinks that he ought to have made threepence on a penny is not comforted by being reminded that he has made twopence. He regards the threepence as the legitimate return for his labour, and holds that in getting only twopence he has been defrauded of half his profits. Even when M. ROUHER dwells on the place which France holds by the side of England in the European markets, he carries no consolation to the manufacturers. They only feel that, but for the Commercial Treaty, they might have been equally in advance of England in the European markets, and still more in advance of her in the French market. What they want in fact is that they should not only drive a good trade at home and abroad, but that their fellow-countrymen should be taxed to support them into the bargain. It is really nothing less than an impudent assertion of their own supreme importance to the society in which they live. We can only make a living profit, they say, under the Commercial Treaty, and we want you to abolish the Treaty, and to tax yourselves freely, in order to enable us to make more than a living profit. The English consumer has learnt to weigh this argument at its true value, and there are signs that the French consumer is about to follow his example.

PARLIAMENTARY SMALL TALK.

THERE is no time at which the contrast between the House of Commons as it is and the House of Commons as it was becomes more disagreeably apparent than in such debates as those of Tuesday last. Great questions will still call forth weighty arguments, but the faculty which small subjects used to possess of doing the same thing seems entirely lost. The peculiar power which Sir GEORGE LEWIS used to exercise has descended to no one. The effect of the change is mischievous in two ways. For one thing, it deprives members of valuable training. There are many men who might usefully contribute to small discussions who cannot take part to any good purpose in larger subjects. We all know, to our cost, the kind of speeches which too often come from the back benches on both sides when the foreign policy of the Government is under consideration. Hashed mutton is all very well in its place, but that place is not in immediate succession to the hot joint. Yet this is exactly the effect produced when an injudicious selection from the weakest points of a speech by a Cabinet Minister or a leader of Opposition is served up as soon as the first speaker has sat down. On such an occasion as last Tuesday, the most commonplace member has at least a chance of being original. He may have really thought out a subject for himself, or he may have special knowledge about it to communicate. For another thing, small subjects sometimes grow into great ones, and when men have been taught to speak carefully on them in the first stage, they

will be more likely to vote intelligently on them in the last stage. Neither of these advantages is likely to be realised when no really good speaker takes part in a debate. The whole affair has lost its interest, and in losing its interest it loses everything that made it useful.

Either of the motions which were before the House of Commons on Tuesday would have given Sir GEORGE LEWIS the precise opportunity he liked. Mr. BLAKE's proposal to abolish the privilege of immunity from arrest now enjoyed by members of Parliament was of little practical importance; but it might have been made the occasion of much interesting speculation on the relation between members and their constituents. The question has long since lost the constitutional importance which may have belonged to it in days when, but for this immunity, obnoxious members of Parliament might have been constantly undergoing arrest for imaginary debts at the instance of imaginary creditors. The issue raised by Mr. LEWIS's amendment was more important than that of a member's protection against an inconvenience which is rarely inflicted on any one. What ought to be the effect on a member's position of bankruptcy, or of those arrangements with creditors which in the majority of cases take the place of bankruptcy? Supposing that bankruptcy constitutes no disability in the opinion of a man's constituents, ought it to constitute one in the opinion of the House of Commons? To what extent are constituents the sole judges of their representative's qualifications? These may be easy questions enough to answer in a particular case, but they are not at all easy questions to answer generally. Yet they have a bearing even upon such pressing matters as the method of dealing with obstruction. If Sir STAFFORD NORTHCOTE's rule is adopted, the House of Commons will be armed with power to say that the representative of this or that constituency shall neither speak nor vote until he has been reconciled to the House he has offended. It would have done members no harm if their ideas upon this question had been cleared up by a good preliminary debate on the not wholly dissimilar question raised by Mr. LEWIS.

The other subject was one of greater interest, though its interest was not derived from the speeches made in the debate. The question of the duration of Parliaments has naturally received unusual prominence from the approach of a dissolution, and Mr. HOLMS and Mr. COWEN have persuaded themselves that the country would be benefited by a more frequent appeal to the electors. A good deal of their reasoning seems to rest on the alleged divergence between the present House of Commons and its constituents. If Parliament sat for five years instead of seven, they contend that the spectacle they are now compelled to witness of a Liberal majority in the country being represented by a Conservative majority in Parliament would be spared them. Of course a very complete change may take place in the feeling of the electors between the meeting of one Parliament and the meeting of the next. But neither Mr. HOLMS nor Mr. COWEN succeeded in showing that quinquennial Parliaments would constitute any safeguard against this possibility. Public opinion might conceivably swing completely round in the course of the first Session of a new Parliament, and in that case the grievance of having to wait four years for the election which would set things right would not be appreciably less than the grievance of having to wait six years. In point of fact, the only complete remedy for this evil would be annual Parliaments, unless indeed it were thought better to institute a system of monthly or weekly votes in each constituency, with the view of determining whether they wished to have a new election before the end of the year. A still more perfect system perhaps would be for each constituency to elect every week a Committee which should have power to give the member notice to quit at the end of the month. In this way elections might be going on all the year round, and Parliament would be reduced to a state of permanent dissolution. The serious answer to this part of Mr. HOLMS's case is that, if public opinion has undergone a complete change, it rarely fails to manifest itself so unmistakably as either to provoke the Government to dissolve or to prevent them from undertaking any serious legislation. Members who wish to stand well with their constituents—and no member who intends to offer himself for re-election is altogether superior to this weakness—are very quick at finding out when the opinion of the electors has swung round; and English Cabinets are seldom desperate enough to risk hopeless exclusion from office after the election by using the last remnants of their power in a way which they know to be distasteful to those from whom it is derived.

The argument that the last Session of a Parliament is usually marked by a general weakening of the leaders' authority on both sides of the House, and by an almost ostentatious desire to curry favour with the electors in whose hands a member's fate will soon rest, is perfectly sound. But it makes directly against any diminution of the Parliamentary term. The really important consideration from this point of view is that no Parliament should be suffered to run out its natural course. Within certain limits, the Government must of course choose its own time for a dissolution, but it is desirable that this time should not be fixed beforehand. The shorter the time for which a Parliament is elected the greater is the probability that it will be allowed to live out its time. Elections being necessarily frequent, a feeling easily grows up against multiplying them without just cause. If Parliaments were triennial, it might be predicted with tolerable confidence that, as a general rule, elections would be triennial also; and, in so far as the substitution of five years for seven had any influence in the matter, it would be in the same direction. But as regards efficiency of legislation—which, after all, is one of the objects for which Parliament exists—any change which shortened Parliaments would be a change for the worse. In the first year of a Parliament members have hardly settled into their places; in the last year they are taken up with speculations whether they will be able to keep them. There remain only the intermediate years, which under a quinquennial system would at most be three. Upon any long course of years the substitution of three years out of five, instead of five out of seven, as the working residuum of each Parliament would effect a considerable subtraction from the available total. Considering the yearly increasing tasks that Parliament has to get through, and the yearly decreasing faculty of getting through them that Parliament displays, very much stronger arguments should be adduced for the change than any contained in Mr. COWEN's job lot of inappropriate historical parallels.

DEAN STANLEY'S MAUSOLEUM.

ON Tuesday last the Dean of WESTMINSTER undertook to defend the intended erection of a statue of Prince LOUIS NAPOLEON in what the world in general knows as HENRY VII.'s Chapel in Westminster, but what the DEAN prefers to call the Royal Mausoleum appended to the Abbey. It is not always given to artists to know their own best work, and it is possible that the DEAN may overrate the merit of the speech he then delivered. That he thinks highly of it may be inferred from his regret that there were not more people to listen to it. Were there not 5,200 signers of the memorial, he seemed to say; but where are the 5,199? Why am I left face to face with Mr. FORDHAM, and with Mr. FORDHAM alone? The DEAN seemingly had the prayer of St. CHRYSOSTOM in his mind; for he made it pretty evident that, had there been no one present but Mr. FORDHAM, he should not have delivered his discourse. Happily for the public, a deputation from the Workman's International Peace Association had paid a visit to the DEAN at the same time. What this Association had specially to do with the matter in hand is not very clear; but they, at all events, formed what the DEAN not very graciously described as "a kind of" audience. As no nearer approach to a real audience was then to be had, the DEAN consented to make the best of things, and proceeded to put the deputation and Mr. FORDHAM in possession of the reasons which have led him to decline the prayer of the memorial. They are of so miscellaneous a character that it will perhaps be best to take them in the order in which they were stated.

The first seems a little self-contradictory. The DEAN distrusts large petitions; but this did not prevent him from finding fault with this one because it is not large enough. "Out of about eight millions of the "adult population of the Empire, 5,200 have signed "the memorial, and out of the adult female population "of about nine millions, three individuals appear to "have signed it." It does not seem to us that an objection to the erection of a statue of a foreign prince in an English church which is shared by more than five thou-

sand representative Englishmen is quite so undeserving of attention as the DEAN thinks. It is fair to say, however, that the DEAN denies that the signatures are representative. From this point of view the number of the signatures goes, he considers, for very little; everything turns on their weight. It is distressing to learn that the DEAN has formed a very low estimate of the assistant-masters of public schools. He had noticed, he said, a remarkable number of signatures of this class, and he places this remark in most suspicious contiguity to the statement that "it is not his opinion that an educated "man ought to be influenced by the opinion of the un-"educated." Assuming then that, as regards public schools, only the head-masters can be regarded as educated, the DEAN points out that only the name of one head-master, the Head-Master of Marlborough, has appeared among the signatures. Oxford and Cambridge contribute no more than one professor each. There is one Nonconformist minister and one clergyman of the Church of England. Seeing Mr. CARLYLE's name, not in Mr. CARLYLE's handwriting, the DEAN jumped to the conclusion that an unworthy trick had been attempted. It now appears that Mr. CARLYLE's name was attached to the memorial at his expressed request. The names of all "the great lights "in science" are absent, the ASTRONOMER ROYAL not, in the DEAN's opinion, falling under that designation. The addition of Mr. FREEMAN's name to the signatures the DEAN evidently considered a positive drawback. He should have known, he says, that that name would be on any memorial relating to Westminster Abbey. This suggests that the DEAN thinks the knowledge of the history of Westminster Abbey rather a disqualification than otherwise for signing a memorial in relation to it. Probably it is not a disqualification which attaches to any of those who originally asked him to accept the statue.

After enumerating his reasons for thinking nothing of the authors of the memorial, the DEAN went on to give his reasons for not acceding to the prayer of it. He is asked to withdraw his consent to the erection of a statue to Prince LOUIS NAPOLEON; how can he do this when he gave that consent originally "from considerations of what "was due to the traditions of the Abbey and to the best "interests of the English people"? The traditions of the Abbey seem to resolve themselves into one—the erection of a statue to the Duke of MONTPENSIER, the brother of LOUIS PHILIPPE. But the Duke of MONTPENSIER was actually buried in the Abbey, which goes for something, and the circumstances of his exile were altogether different from those of Prince LOUIS NAPOLEON's exile. At that time the cause of the BOURBONS was generally accepted by the English people as their own cause. They were at war with NAPOLEON I., and they did not in the least care whether the French took offence at the erection of the statue or not. In the case of Prince LOUIS, the Government of France is a friendly Government, and when the pretensions of an exile are in necessary and constant opposition to the very existence of that Government, it is alike prudent and decent not to give those pretensions anything that may be twisted into a public recognition. How the best interests of the English people are to be promoted by the statue the DEAN did not say. The only explanation that occurs to us is that he looks on its erection as making friends of the mammon of unrighteousness. The BONAPARTES may some day again be rulers of France, and it may then serve the best interests of the English people that they should have been civil to one of their number when the family was in its low estate. Whether the present head of the family is likely to be specially drawn to us by this act of respect to his cousin may perhaps be doubtful, but the DEAN thinks it best to be on the safe side.

If we understand the DEAN rightly, he is tempted to regret that so many Englishmen eminent in art, literature, or science have been buried in the Abbey or the adjacent cloisters. He would rather have their room than their company. The public interest, even of the humblest classes, in the graves of MARY Queen of Scots and of the two Princes murdered in the Tower far exceeds that with which they view the graves of Sir ISAAC NEWTON or of PITT and FOX. If this is a reason for multiplying monuments to princes, it would clearly have been better not to waste any of the necessarily limited space at the disposal of a Dean of Westminster in burying Englishmen eminent in art, literature, or science. From the point of view of popular interest they are mere cumberers of the ground. Every English prince without exception might have had a tomb in the Abbey, and the bodies of a few of the less esteemed members of foreign royal families might have been obtained to fill up vacancies. We hope that the DEAN will not think us wanting in respect for that "heart" which he claims for the Abbey when we suggest that, if popular interest is the best qualification for interment in Westminster Abbey, there is a class of persons who have a better title to the distinction even than princes. The true way to make the Abbey interesting would be to make it a mausoleum of distinguished murderers. In that character it would bear the same relation to its present self that the Chamber of Horrors at Mme. TUSSAUD's bears to the more commonplace room which contains the effigies of monarchs and heroes.

The DEAN's final argument was drawn from the "uni-"versal regret and sympathy" with which the news of the PRINCE's death was received in England. It is strange to hear the existence of this feeling urged as a plea for an act which more than anything else will check this regret and sympathy. Englishmen thought they could safely express their sorrow for a young man's death and a mother's bereavement because these were wholly dissociated from political considerations. The proposal to erect a monument of the PRINCE in Westminster Abbey—we beg the DEAN's pardon, in an appanage to Westminster Abbey—was the first inroad of political feeling into this general mourning. It gave a false colour to the regrets which had been freely uttered, and made the nation an accomplice in an act which, however it may be disguised, cannot but be open to an unfriendly interpretation on the part of the French people. They send the BONAPARTES into exile. We bury them in Westminster Abbey. The ordinary Frenchman will certainly be disposed to read in this contrast a virtual censure by Englishmen of what Frenchmen have done.

THE LATE OPERATIONS AT CABUL.

THE clear accounts furnished by the Correspondents from the camp at Cabul admit of a judgment being now formed of the various actions of last December which resulted in the force being suddenly converted from assailants into assailed, and finding themselves shut up for a time in their entrenchments at Sherpur. The rising of the tribes, and their combination on so large a scale, undoubtedly took us by surprise; nevertheless, the moral aspect of affairs would probably not have been so quickly changed but for two unfortunate incidents—the abortive charge of the cavalry and the temporary abandonment of four horse-artillery guns on the first day, and the loss of the two mountain guns on the last day's fighting. As for the first incident, it is difficult to find fault with the display of so much gallantry; but for a handful of cavalry to charge an army, and over very broken ground—even although that army be not a disciplined one—is not war. Both men and officers suffered very heavily, especially the former, and without inflicting any appreciable loss on the enemy. So bad was the ground that when a handful of the broken regiment of Lancers was got together for a second charge, the men had actually to advance in single file. The moral effect when cavalry are thrown away in attempts to accomplish impossibilities is not the least of the bad results. It must be remembered, however, that the greatest master of modern war over and over again made this mistake, as, for example, in the notable instance in the Spanish war, described by De Ségur, where Napoleon sent the Polish Lancers of his Guard to carry a Spanish battery securely posted above a ravine, galloping up which the gallant horsemen were most of them destroyed without being able even to approach the object of their attack. The common fault, no doubt, in handling cavalry is not to make sufficient use of them; but it requires a peculiar genius to seize the right moment for letting them go, especially against infantry; and if a mistake is made cavalry soon get out of hand. The temporary loss of the guns appears to have been due to their leaving the road, and being taken into ground where they could neither advance nor retreat; but the position of an unfortunate battery commander who is getting orders simultaneously from his colonel, his brigadier, and the general, is not conducive to decision in action. That the guns were recovered by a gallant staff officer was a piece of good fortune on a par with the ill luck of their loss in the first instance. The enemy, unaware of what had happened, made off in another direction, and the guns were left in the ditches where they had been abandoned, to be brought off without any serious fighting.

When the news of the loss of the guns and the unfortunate action of the cavalry was brought into Sherpur by some of the most rapid riders from the scene, a scare was not unnatural. The enemy was between the camp and Macpherson's and Baker's brigades, which were both away at a distance; and it was not known how they had fared. But the opinion which has since been expressed by some Correspondents, that the Sherpur

camp was really in serious danger of being carried, is surely not borne out by the facts. Even if only eight hundred fighting men were left in the place, we may assume, from what we know of the quality of the two sides, that this force would have been quite sufficient to hold its own until the two brigades came up to help; while an attack made on Sherpur by a force which had two of our brigades in its rear would not have been made with much deliberation or persistence. That our handful of cavalry, acting on ground quite unsuitable for horsemen, had not been able to make any impression on the enemy, hardly justifies the inference that eight hundred infantry, fighting on their own ground, would not have been able to hold their own against any number of the Afghans. And, indeed, a couple of companies of the 72nd, posted in the gorge of the Cabul river, sufficed to turn the assailants away from their line altogether. Still we had unquestionably been surprised and outmanœuvred; there had been considerable misadventures during the day, and a less courageous general than Sir Frederick Roberts might well have determined to withdraw his force at once within the Sherpur line until the arrival of reinforcements. Had this been done, the result would in one sense have been the same, because this concentration was eventually forced upon the commander; and the subsequent three days' fighting would have been saved. But the attack on Sherpur which followed would probably have taken place much sooner, and before the position had been strengthened, and have been made with much more determination than was actually exhibited. And although the three days' fighting was inconclusive—indeed may be said to have resulted in defeat, since we had to give up the contested positions to the enemy—still it was illustrated by an exhibition of the splendid fighting qualities of our infantry. Nothing could have been finer than the way in which the heights above Cabul were carried, by an admirable combination of skill and pluck. The one unfortunate incident in the business, the loss of the two mountain guns, seems to have been mainly due to the fact that a detachment of native infantry, belonging to an excellent regiment, but led into action by a gallant young officer of Dragoons who had never done a day's duty with them before, and could not speak a word of their language, would not obey their leader, but went back when they ought to have gone forward. This is an unfortunate thing to do in action; but the sort of arrangement which brought it about is not fair to either officers or sepoys. A Ney or a Murat at the head of British soldiers would not have fared better. The native troops by general consent have behaved admirably in this war when led by officers whom they know and who know them; but, so long as the present system of officering the Indian army is maintained, these conditions must often be wanting; the officers of a native regiment are always liable to be suddenly used up.

The repulse of the attack on Sherpur does not call for much notice, because we had it all our own way; but the duty before it took place was severe, and the reaction upon this, and the subsequent ennui, may perhaps be sufficient to account for a certain tone of despondency which is somewhat too noticeable in the correspondence from that place; while there has been a tendency to make too much of the loss incurred. A list of about three hundred killed and wounded in four days' fighting, out of some four thousand who appear to have been actually engaged, is not large, although, no doubt, the attendant conditions may have served to intensify the effect on the imagination. Some of the loss was unnecessary, and the troops were called on to carry positions which they had to give up immediately afterwards; but further, whereas in ordinary battles the casualties are, so to speak, promiscuous—there being little room for taking aim or for prominence of individuals, but men are knocked over by chance—here some of the best and bravest were the first to fall; some of them men who had already distinguished themselves by their soldierlike qualities, while others were killed in the act of making their reputations, leading on their men and falling at their head in personal combat. In one sense, indeed, the loss may have been insufficient. It is certainly the case that our most bloody battles in India have usually been also the most decisive. We suffered terribly in the engagements with the Sikhs; but they suffered still [illegible], and at last, confessing themselves thoroughly beaten and [illegible]pting the position, gave in completely. The Afghans have [illegible]ver yet been thoroughly punished; perhaps, if they were, they too would knock under for good.

As regards the future, the arrangements which are now being made for strengthening the position at Cabul will put all further attack on it out of question. The forts, within a few hundred yards of Sherpur, which the enemy occupied from the 15th to the 23rd of December, and from which we were unable to dislodge them until, after the grand repulse, they went off of their own accord, have now at last been destroyed, as they should have been in the first instance; all cover round the walls is being levelled; broad roads admit of a sweeping artillery fire in all directions; Sherpur itself has been strengthened, and we have also constructed detached posts which should prevent the enemy from even approaching it or the city of Cabul; the heights above Cabul which were the scene of the three days' fighting being crowned with redoubts which should be practically quite impregnable against Afghan assailants. The Cabul Correspondent of the *Times*, who is understood to be an experienced veteran, suggests a doubt whether the line of posts is not too extensive for the available force; but it is far better to form your retrenched camp by means of detached works so as to admit of the garrison moving freely about in support of the different outworks, and to keep the enemy from out of range of the main position, than to strengthen the latter only, and to leave the exterior circumference all neutral ground. In the present case, too, it must be of paramount necessity to prevent the insurgents from again obtaining possession of the city, even temporarily. Their last occupation was undoubtedly a very untoward event. Our general tendency in India is to be indifferent to the point of recklessness about taking precautions of this sort, and making defences supply the place of numbers. To this day there is hardly a fortified post throughout the length and breadth of India, and it is very unlikely we shall do too much in this way even at Cabul.

It is impossible to mistake the tone of weariness which, to judge by the correspondence in the papers and the general tenor of private letters, seems to have come over the garrison of Cabul. Officers and men are represented as being sick and weary of the war, and longing to be back in India. The feeling of weariness is not unnatural; the troops are now suffering all the discomfort without having any of the excitement of campaigning. But the present situation of things is very much what might have been expected. It was pretty evident, when Roberts made his first advance over the Shuturgardan, that as soon as he had succeeded in reaching Cabul there would be little to do save to hold on there till the spring. On the whole, things have turned out much better than could have been expected; a bold policy, as usually happens in war, has proved a successful one. The health of the army has been good, considering the circumstances; indeed, what the troops in the Kyber, which are in much worse case than those in advance, are suffering from now, is not the sickness produced by the present cold, but the result of their trying march back to India last summer, from the effects of which some regiments in the rear are still almost entirely prostrated. But when we hear it said that a definite policy is now wanted, it may be replied that an army has nothing to do with policy; while there can be no question of retirement in the present state of things. Opposition must first be put down, in whatever part of the country it appears, before we can begin to think about vacating it. Perhaps it is because wars in recent times have been brought to an end so quickly that murmurs are now heard about the duration of this war; but it may be as well to remember that our Peninsular army was—some part of it—eight years at work, and that many of Napoleon's troops were absent from their own country much longer than that. At any rate, the words of advice lately spoken by the Premier will not be out of place; our soldiers, as well as our politicians, have to be firm and steadfast. But with the renewal of active operations in the spring, campaigning in Afghanistan will probably assume a livelier aspect.

THE FRENCH NOBILITY.

A SERIES of articles on foreign nobilities has lately appeared in the columns of one of our daily contemporaries. The subject has a certain amount of interest and importance in the democratic days on which we are fallen, when merit and money are each struggling to oust mere aristocracy from its traditional vantage-ground. We ask ourselves, when we see how are the mighty fallen in some other countries, if the force of tradition, the strength of material wealth, and the generally deserved moral power that hedges round our own titled aristocracy, will avail for long to preserve for them their place, influence, and social predominance. If the House of Peers were swept away in obedience to some new theory, and in its stead there were set up a Senate after a foreign fashion, if we altered the laws relating to land and the succession thereto so as to make them satisfactory to Mr. Bright and Mr. Chamberlain, where would our nobility be then?

It is a pity that the writer of the article on the French nobility in the journal referred to, while giving us but little information of value, should have been at the pains of representing them in a ridiculous light. We suspect that he had been drawing his knowledge from democratic sources, and that he has not much personal acquaintance with the subjects of his satire. He gravely tells us that in France there are over five hundred dukes, several thousand marquesses, and between two and three hundred thousand counts. At that rate, one might calculate that every fiftieth man one met in the street would be a nobleman. And this would be leaving out of reckoning the viscounts, who would be proportionately numerous, and the barons, who would be as thick as blackberries. It is scarcely necessary to say that the estimate is enormously exaggerated. There are in France, as with us, five hereditary nobiliary titles, which correspond with our own—namely, those of *Duc*, *Marquis*, *Comte*, *Vicomte*, and *Baron*—though some mysterious difficulties attach to the relative precedence of marquis and comte, which we do not pretend to fathom, only observing by the way that Napoleon hated and never would confer the former title. We may also note the curious custom in one or two families of alternating titles, the marquis succeeding his father the comte, and being in his turn succeeded by his son as comte, and so on. There is no such title as *Prince*, other than belonging to Royal or Imperial families. Princely prefixes to French names are therefore of foreign importation and origin. The most eminent before the Revolution belonged to dignitaries of the Holy Roman Empire. Napoleon, indeed, created a few princes other than of the blood Imperial, but they were made princes of localities not in

France. Of such were Ney, created *Prince de la Moskowa*; and Berthier, created *Prince de Wagram*. One of the compilers of our Red Books holds that, though the nomenclature and sequence of rank of the five degrees of French nobility correspond with our own, such correspondence exists but in name or theory. A foreign countess, he says, is in no way a countess in our sense of the term. But the only difference—it is of course a striking one—is that foreign countesses are not peeresses, or rather are not the wives of hereditary legislators. With that exception there is no distinction whatever as regards rank; and the wife of an Irish or Scotch earl having no seat in the House of Peers is the exact counterpart of the wife of a recognized French count.

In estimating the value of titles, the dignity of their possessors, and the degree of precedence which should be accorded them, it is of course essential to ascertain whether they are the genuine creations of sovereigns; for the periodical chaos into which the country is thrown by sudden changes of government, and the assumption of power by new men in all departments of the State, opens many doors to all sorts of claimants and adventurers. The genuine nobility is composed of the *ancienne noblesse* of the Bourbon monarchy and nobles of Napoleonic creation. As a rule, the latter are held in scant respect; but there are striking exceptions; and the descendants of such men as Lannes, Masséna, Davoust, Ney, and two or three more, bear names and titles indissolubly associated with traditions which will perhaps for ages be enshrined in the heart of the great mass of the nation. But Napoleon made nobles out of other than heroes. He knew well the shallowness of the ridiculous theory of equality in a country with a history like that of France and among a people who perhaps, above all others, appreciate those distinctions which separate them from and elevate them above the common herd. Since he signally failed, even at the height of his power and renown, to rally to his cause in any considerable numbers the high nobility of the Bourbons, he was compelled to make fresh creations. Generals of brigade, on attaining that grade, became *ipso facto* barons; generals of division became counts. All the marshals, with but two exceptions, if we remember right, were made dukes or princes.

With the collapse of the Napoleonic Empire this state of things came to an end. The brand-new electro-plated *noblesse*, despised by the sterling old nobles of the Royalist monarchy, had not been able to conciliate the respect of the masses: and indeed were regarded as an anomaly in a democratic Empire, and with reason. The people, however cajoled, fascinated, terrified into humble obedience to their democratic Emperor, nevertheless resented the attempt to create a race of minor divinities, and to revive traditions supposed to have received their death-blow at the Revolution. The whole theory of the Bonapartes is that they are the elected of a free people having equal privileges and an equal voice in all matters—that they are the natural chiefs of a Republic, or sovereigns of a Republican Empire. For years after Napoleon I. was seated on the throne the coinage of the country bore on one side the words, "Napoléon I. Empereur," and on the other "République Française." That was a strange jumble of ideas, impossible perhaps in any other country than France—the land nevertheless of logic. On the one side, a theory of liberty, equality, fraternity; on the other, its practical annihilation. But to invent an hereditary nobility was to make the confusion of ideas yet more complete, and indeed such a nobility was quite out of place, and had no *raison d'être* under such conditions.

On the Restoration of the Bourbons the remnants of the old aristocracy began to return from voluntary or enforced emigration, or from home isolation. Although shorn of their privileges and much of their wealth, and no longer feudal lords, they were suffered to regain, amid a people disenchanted with their idols and wearied with change and loss, some little of their ancient prestige. Charles X. was surrounded by as brilliant a throng of historic names as ever gathered about a Court. But he and they soon showed that wisdom and pedigree were not interchangeable terms, and then came the *bourgeois* King Louis Philippe, who sought a popularity, which proved of no long continuance, among the middle rather than the upper classes. In his reign some titles were conferred. In one instance he conferred on his Chancellor, M. Pasquier, a dukedom, which is now enjoyed by his nephew (born Audiffret), as Duc d'Audiffret-Pasquier. The revolutionists of 1848 abolished titles and proscribed the use even of the prefix *de*; but these measures met with but indifferent success in their application. They were, however, an improvement upon the proceedings of the men of '89, who were not content with depriving nobles of their distinctions, but, to make doubly sure, deprived them of their heads—all they could catch. In 1848, laws and enactments notwithstanding, a kind of freemasonry was established by the threatened class against which legislation was almost powerless. On the reappearance of the Empire titles were officially restored, and steps were taken to preserve the institution of nobility from further deterioration. Not only was it forbidden to assume a title, or even the *de*, or any name other than the designation defined in the *Acte de Naissance*, but such assumptions were made punishable by fine and imprisonment. Moreover, any notary allowing the insertion in a public or official act or document of an assumed title or name was rendered liable to a heavy punishment himself. In addition to this, a Committee was appointed to examine into the validity of all titles and of all claims to bear titles. The *Acte de Naissance* is a voucher which must be produced by every Frenchman when he comes into contact with the State or with the official world. It defines the owner's exact capacity, and is implicitly to be relied on. In the cases, however, of all persons born before 1805, during the revolutionary era, the *Acte de Naissance* ignores claims to titles, and even the right to use a *de*, so that nobles born in that epoch have to make good their claims from other sources. The titles conferred by Napoleon III.—Duc de Magenta, Duc de Persigny, Comte de Palikao, &c.—were imitations of the titles of the First Empire.

Unfortunately for the reputation of the order, not a few persons in France have, in spite of prohibitions, continued to use titles with which they have dubbed themselves. Imperial thunders, effective enough when launched against men in the performance of public acts, failed to overwhelm the mere counts of social intercourse, who would drop their designations at critical moments and subside gently into their proper quality before the law. It may not be generally known that, strictly speaking, there are no such things in France as courtesy titles. The son of a duke is plain *Monsieur*, just as the daughter of a duke is plain *Mademoiselle*. Whether it be in imitation of German or English custom we know not, but the practice has generally obtained during this century of eldest sons taking the title the next below that of their father, and of younger sons using an inferior title; qualifying the assumption, just as younger sons of dukes and marquesses do in England, by the addition of the Christian name. It will be seen, therefore, that, as Sir Bernard Burke has observed, it is essential, when we want to establish the true status of a man in his own country, that each separate case should be inquired into; for while it would be discourteous to some foreign guests to deny them that precedence and regard which is really their due, it would be absurd to treat others with a distinction to which in their own land they are strangers.

In France, then, speaking generally, the aristocracy may be divided into the families of the descendants or survivors of the *noblesse* of the Bourbon monarchy, which numbers in its ranks the *noblesse* of the Court, capital, and historic fame; and the *noblesse de province*, which, often locally powerful, has not, from want of means and other causes, come prominently forward or made a figure at Court; the titled of Napoleonic creation; and the holders of courtesy titles. But we must not omit to notice a class of possessors of sounding titles and ringing names which are not to be found in any *Livre d'or*, or *Annuaire de la Noblesse*, and which the *Almanac de Gotha* most unceremoniously ignores. These much affect the large "thermal establishments" in Italy, Germany, Spain, and Southern France, as being the rendezvous of a motley gathering of celebrities and nobodies of many countries, in which they find opportunities of borrowing money on the strength of sonorous titles which it is worth nobody's while to challenge. These adventurers know well the ridicule to which their pretensions would expose them in their own native *arrondissement*; and although in France ridicule kills, they are alive to the strange fascination which almost any kind of title has for the people of this country, and shape their course accordingly. Unless Paterfamilias see a newcomer dangling after his wife and daughters he does not trouble himself to inquire into the family history of a casual acquaintance. Besides, even fairly good English society nowadays is pretty largely made up of people too anxious to establish their own claims, and with no particular ancestral traditions they would care to have scrutinized, to be too inquisitive about the foreign count with his polite address, and his countess with her Parisian fashions. But it is by no means difficult for the curiously inclined to obtain some clue to the real position and antecedents of a foreigner. In the case of French subjects a reference to their Embassy and to the *Annuaire de la Noblesse* will usually obtain the required information.

To sum up, the French nobility is still a social power of no mean order. If its exclusiveness and its indisposition to descend into the arena to fight with the masses diminish its political power and its capacity for usefulness, these negative qualities rather add to its social importance. The frequenters of fashionable drawing-rooms cannot fail to be struck with the peculiarities of address and manners which mark the democratic *parvenu*; and in Paris the diplomatic body and foreign visitors of rank naturally prefer, so far as they have a choice, to associate with those whose principles, habits of thought, and everyday manners are akin to their own. And, the nobility is a political power; though, because its influence is in these days exercised at a distance from the great centres of industry, and because it works beneath the surface, English writers are apt to underestimate its latent importance. But its numbers are great, its wealth is far greater than is generally supposed, and, in the spirit of freemasonry peculiar to all aristocracies, they pull well together. We need only look, in proof of this, at the division-lists of the late National Assembly. Moreover, the active sympathy of large bodies of the nobility with the priests, and the almost fanatical zeal of vast numbers of women for religion, contribute together to exercise, especially in country districts and smaller towns, a strong counter-balancing influence to that of the *libres penseurs*.

We have not attempted to treat of several important parts of our subject, such as the varying privileges of the nobility at different epochs; nor have we referred to the extremely numerous *noblesse de robe* which was swept away at the Revolution, and whose members were only nobles through their tenure of certain offices, but had no social standing. It is sufficient to observe that, though as late as less than fifty years back the nobility constituted a class of which the people entertained an inveterate jealousy, now they possess not one single

privilege outside the social circle. But though the institution is not on that account to be ridiculed, seeing that it numbers in its ranks some of the most respectable elements of the community, and is moreover the depository of grand and glorious traditions, it would be idle to make a comparison between the French nobility and the peerage of England. Our nobles, besides being a less numerous and therefore more important class, are hereditary legislators, and supporters of monarchical traditions in a country long and happily rooted in its attachment to and respect for constitutional royalty. In another sense, also, it is evident that comparisons are out of place between the English and French peoples when their institutions, national characteristics, and ways of looking at things are essentially different. In England, for instance, the wealth or the reputed wealth of a nobleman has very much to do with the amount of interest which he excites. In France some persons would honour a nobleman in virtue of his ancient origin; others would ask, "Is he for the King?" (true Royalists never say the *Comte de Chambord*); but a more numerous party only respects nobility when allied with intellect. It is most rarely the case that the first question asked about him is, "Has he much money?" An English lord is looked upon in France as a man who has unlimited means; but it can truly be said that, except in certain circles in Paris, as among hotelkeepers and tradesmen, he excites no interest whatever on that score.

So long as a people respect the honours and orders of their country, it is absurd for outsiders to disparage and ridicule these distinctions. We in England may think that the Legion of Honour is so widely distributed that its possession cannot be particularly prized. There can be no greater mistake. It is greedily sought after and intrigued for by men of all ranks and all parties throughout the country. "Not one simple Chevalier of the Order," said once a French gentleman to us, "would exchange his little bit of red riband for the noble Order of the Garter!" And the same thing may be said of titles. Some staunch Republicans excepted, there are few counts or barons who do not keenly appreciate being counts or barons; and among the untitled multitude there are few indeed who, being even distantly related to a duke or marquess, would willingly allow the fact to escape the general knowledge. So there is still in the land of equality a large store set upon inequalities.

THINGS THAT COME CHEAPER IN THE END.

All vicious pleasures are greatly enhanced when it is possible on any pretext to persuade oneself that they are the fulfilment of a duty. The Manicheans, without doubt, enjoyed their debaucheries all the more because they were indulged in at their religious assemblies; the Protector's soldiers thought it fine fun to kill their enemies to the cry of "The sword of the Lord and of Gideon"; and invalids have felt a virtuous satisfaction in acquiring a fatal habit of nipping because their doctors have ordered them to take a glass of wine when they feel weak. Extravagance, too, like other vices, has an additional charm when it can be yielded to under the cloak of prudence. Economizing is not a very agreeable process; but to be able to fancy that one is economizing when one is in reality launching out into unusually heavy expenditure must be delightful indeed. We sometimes meet with people who seem to enjoy deceiving themselves more than any other amusement; and no form of self-deception can be more agreeable than imagining that present extravagance means future thrift.

Thus a resident in London will persuade himself that it would cost less to take a house by the year in a quiet part of Berkshire or Surrey wherein to spend the autumn than to make an annual tour on the Continent with his wife and family. It is the easiest thing in the world to prove this on paper. Rent will be so much; the wages of a gardener—whose wife will take care of the house when uninhabited by the occupier—so much more; the probable cost of living is also put down, and now you have everything that need be entered on the debtor side of the estimate. On the creditor side you must put the average cost per month of living at first-class Continental hotels; the railway expenses of a tour in Switzerland, Germany, or the north of Italy; and the sums generally laid out on dresses for the girls when at fashionable [illegible]n cities or watering-places, as of course they will be able to [illegible]r their old clothes in the proposed rural retreat. Now add up [illegible]e columns on each side, and the little house in the country will show a flattering balance of several hundred pounds. What could be simpler? If the simplicity were to be strictly adhered to, the truth of the estimate would follow as a necessary consequence; but simplicity, like soda-water, requires certain additions to make it palatable to people who are accustomed to town life in the nineteenth century. At the model villa, for instance, of which we have spoken, it is soon found that at least a pony carriage is indispensable; and as locomotion is a very slow affair in a one-horse conveyance, a pair of ponies and a larger carriage are, after a while, considered necessary. Three or four ponies are bought and sold (not at a profit) before a pair are procured which satisfy the occupier of the happy retreat, and by that time they have cost as much as horses or more. Indeed their owner is not sure that a pair of horses would not have paid better in the end. Further, it is not very pleasant to have a dirty, ill-dressed, and untidy-looking Jack-of-all-trades sitting behind your carriage; therefore a smart groom, with a neat suit of livery, becomes a necessity. But then he will take care of the ponies, and keep the new harness from getting spoiled; so, despite his high wages and the cost of his livery, it is believed that he will eventually prove a saving.

Again, unless a man has some sports or other amusements to while away his time, he can scarcely live for two or three months at a country house without acquiring some taste for gardening. We have heard divines say that, of all recreations, gardening is the most innocent. They are probably right, speaking in a general way; but there are instances in which this innocent recreation would appear to be the veritable "mischief still" spoken of by the poet as readily procurable for idle hands. Let a man once taste the sweets of high gardening, and, unless his moral courage and self-denial are of an equally high order, he is pretty certain to run into extravagance over his hobby. He is always longing for more and more glass. He finds, too, that he wants more and more under-gardeners; and he only requires a head-gardener who understands the art of persuading him that an increase of his hot-houses, his forcing-pits, and his horticultural staff will pay in the end, to have a very fair chance of making his gardens one of the heaviest items in his annual expenditure. It appears to us that the innocence of gardening is rather overrated. Extravagance in a garden can hardly be said to be much more virtuous than extravagance in a stable. But many people seem to consider a love of flowers a sort of whitewash for a multitude of sins. We have known men who were anything but moral in their conduct say, with an air of childish innocence and simplicity, "Well, after all, my greatest pleasure is my garden," as if their admiration of beautiful flowers quite atoned for all their less guileless tastes. When a man takes a country house it behoves him to be specially on his guard against the delusive innocence of gardening, or he will soon find his real balance-sheet very different from the ideal document which we suppose him to have drawn up before coming to the conclusion that a small country house, as opposed to foreign travel, would pay in the end. Our rural householder is further told that nothing pays so well as a pig, and he accordingly buys a couple of pigs, and these pigs really do pay pretty well so long as the family are at their country house; but when they return to London there is an absence of the desirable fluid commonly known as "wash," on which pigs thrive, and meal, though an efficient and more fattening substitute, is not inexpensive. As regards poultry, a few hens are found to pay their way so well that some pens of prize birds are purchased, as it is so much nicer to see thoroughbred things about one; and, independently of the primary cost of these treasures, a large sum has to be laid out in making suitable yards for them, protected with wire-netting. In order to procure the desired poultry, the *Exchange and Mart* is taken in for a few weeks, with the usual result. Chickens, ducks, pigeons, ring-doves, parrots, tame rabbits, and peacocks are bought on most advantageous terms, and boxes, hutches, cots, and pens are made for these charming pets. There is a St. Bernard dog advertised in one number of the periodical, which is too tempting to be missed. He is guaranteed to be of enormous size, quiet with children, clean in the house, good-tempered, affectionate, and a faithful guardian. He turns out to be all that his panegyrist described, and he becomes the pet of the household; so much so, in fact, that it is voted a pity that a suitable helpmate of the same breed is not at hand. To the delight of everybody in the house an advertisement is found in the paper already mentioned of exactly the animal required, and although the price is rather high, she is purchased, because breeding St. Bernards is well known to be a lucrative proceeding. When the time comes for the return to London it is found necessary to appoint a functionary whose sole duty it will be to attend to the pets which have been procured through the convenient medium of the *Exchange and Mart*. Some shooting being to be let in the neighbourhood, it is taken by the occupier of our model residence, because it is a chance which might never occur again; and of course a suitable keeper is engaged to look after it. Every one assures our sportsman that he will find it cheaper in the end to have a regular keeper. When the domestic accounts for the year are drawn up under the chilling atmosphere of the month of February in a gloomy study at the back of the London house, it is found that between shooting, ponies, gardens, pigs, poultry, St. Bernards, and other pets and hobbies, the country villa, with its accompaniments, has cost even more than did the tours on the Continent of former years. The end has come, and the venture has certainly not paid.

If dwellers in cities deceive themselves in expecting country villas to prove economical, dwellers in the country deceive themselves still more with respect to London houses. People who have been in the habit of going to a London hotel or lodging-house for six weeks in the season are sometimes enamoured of the idea that it would be cheaper in the end to take a house. The rent of a small house is, they argue, rather less than the price paid for lodgings, and it would cost no more to keep the servants in London than to pay them board-wages in the country. The only extra expense would be the carriage of the servants to London and back, and this would be amply repaid by the comfort which would be thereby procured; in addition to which it would be much cheaper to feed oneself in one's own house than to pay a West-End hotel or lodging-house-keeper's charges per head for meals. Then at hotels or lodgings each visitor at luncheon, or even tea, is charged for at an exorbitant rate, even if he or she scarcely tastes food; while at one's own house a few people looking in when eating or drinking is going on will not perceptibly affect the bills. Then there will be another great saving—indeed, we may say the greatest

saving of all; when London people show hospitality to the country bumpkin who is residing in lodgings, he is unable to repay their kindness in town; he is often therefore obliged to invite his London hosts to spend a few days with him in the country in return for a single dinner-party, ball, or kettledrum. Now, if he takes a house, he will be able to give a tooth for a tooth; or, to speak more accurately, a dinner-party for a dinner-party, which will be a far better business than feeding a man for a week who has only fed him for a couple of hours. It seems, therefore, very clear to the unsophisticated country gentleman that to take a house in London will pay in the end. When he begins to put his notion into practice he arrives at the conclusion that, the chief extra expense being the journeys to and fro of his servants, the proportionate cost will be less according to the time they remain in London. The average weekly expense of three months will therefore be less than that of six weeks, and a considerable saving may thus be effected at home, because for so long an absence it will be worth reducing the number of men employed in the garden and stables. The cost of the servants' transit, however, and the carriage of the trifles which the cook and butler consider indispensable, amount to considerably more than the estimate, and it is found necessary to have a charwoman and some packers' men in the house for two or three days, both at the beginning and the end of the London visit. The cretonnes and chintzes in the reception-rooms are found to be so dirty that it is decided to purchase new covers for the furniture of these apartments, both for the sake of cleanliness and comfort, and because it will be the most economical proceeding in the end. It would require time and money to clean and callender the old ones: besides which, they would never look really nice after they had been cleaned. London dinner-parties, again, turn out to be far more costly entertainments than was supposed. A good many bachelors and non-dinner-giving dowagers have to be asked to make up a party to meet perhaps one pair of dinner-giving friends, which makes the average cost of repaying dinner with dinner alarmingly high. London luncheons, too, when properly done, prove far from economical meals. But a drum, at any rate, is a cheap affair. At least so thinks a country squire until he receives the bills for the hire of the plants, the glass, and china, the strawberries, the champagne, and the greengrocers. Having a house in London extends one's acquaintance in a wonderful way, and obtains much hospitality; but, besides the necessity of repaying that hospitality in kind, there is the expense of keeping extra night horses and men, or of hiring a brougham at so much an evening. Altogether, when a country gentleman takes a London house for the season, because he thinks it will be cheaper in the end, he is unlikely to find his annual budget improved thereby.

We have only given a couple of familiar instances of the fallacy of expecting certain expenses to turn out probable economies. Many other cases must at once occur to the mind of every head of a family who has any experience. We may conclude by suggesting as food for retrospection and contemplation the various outlays which most householders have at different times made at the request of their servants, who assured them that, although they might appear heavy at first, they would certainly pay in the end. Whether this pleasant anticipation was eventually realized, we leave to those experienced in such matters to say.

CARDINAL MANNING ON THE CHURCH AND SOCIETY.

MR. FROUDE has been contributing a couple of highly characteristic articles to the last number and the last but one of the *North American Review* on "Romanism and the Irish Race." The moral of the tale is summed up at the opening of his second article, where he concludes that, "if England could have thought only of herself," apart from Ireland, she might have left her penal laws against Papists—which were a perfectly fair retaliation on Papal intolerance—unrepealed; and without Catholic Emancipation there would have been "no Catholic revival," no "Tractarian or Anglo-Catholic movement in the English Church," Cardinal Manning would perhaps never have been converted, and Cardinal Newman would have carried with him into obscurity but a few nameless personal admirers. As it is, Latitudinarians and High Churchmen have brought about between them a result which each least expected; "O'Connell's Irish tail and the Oxford theologians created together the singular phenomenon of English polemical Ultramontanism." Certainly O'Connell would have been surprised at the theological, and the Oxford Tractarians at the political, results to which their respective influences have contributed. But Mr. Froude's object is to reaffirm once more the half Catholic, half Carlylean principle on which he has already so often insisted. "Romanism, burdened with so many spiritual incredibilities and so dark a history," was rightly put down with a strong hand, but when a mistaken "Liberalism" withdrew the pressure, it began at once to recover its ground, because it represents a very real and essential principle which the world cannot afford to forget—the principle of authority, or in other words the "natural superiority of truth to falsehood, and right to wrong." It is indeed a delusion to imagine that the Catholic Church is our divinely appointed guide, but it is quite true that there ought to be a divine guidance somewhere, "and, as long as modern civilization continues to deny it, a growing section of mankind will support the Church in refusing to reconcile itself with modern civilization." Mr. Froude of course adds that the Church will come to grief in the long run, for "Romanism cannot again command the serious belief of mankind," but meanwhile England and the United States have a good deal to learn from her, though the lesson may be an unpleasant and humiliating one. And we are left not obscurely to infer that the lesson to be learnt is the duty of suppressing error with a vigorous hand, when once we are clear about the truth. As a distinguished sceptical Professor is reported to have said to Cardinal Manning, "the principle of persecution is right, only you Ultramontanes burn the wrong people." How far Cardinal Manning is prepared openly to endorse that principle, it might not be easy to determine, but we can hardly be wrong in assuming that the article from his pen on "the Catholic Church and Modern Society" which appears in the current number of the same Review was suggested by a perusal of Mr. Froude's papers, though he makes no reference to them. Nor is it very easy to discover what point precisely he is aiming at, though he begins by telling us that his object is not speculative and abstract but strictly concrete and practical. The first part of his paper indeed, if not abstract, is as dry and technical as the rules and definition of a logic manual, without being remarkably original. It is intended to indicate the true nature of Church and State and their relation to each other. We may however pass over these "premisses" of his argument, and come at once to his conclusions, which, if not always easy to reconcile with the premisses, are at least flattering to our national self-esteem. He refers once or twice casually to the Syllabus, but quotes at some length from the Encyclical of Leo XIII. in 1878, and apparently wishes to promote that better understanding between the Church and the Civil Power which the present Pope has all along shown himself specially desirous of bringing about. At the same time we are warned at the outset that the Church can only partially hold political relations with such States as have departed from Catholic unity, which includes all the States of modern Europe. As Mr. Froude holds that England made a mistake, if it was an unavoidable one, in relaxing the penal laws against Papists, Cardinal Manning holds no State to be in a normal and legitimate condition which does not enforce penal laws against Protestantism. The excuse of necessity may in either case prove a valid one, but it is an excuse for a necessary evil.

And now we will try to give a summary of the Cardinal's view, which seems at least to be intended to correspond with the principles of Leo XIII.'s Encyclical. The Church, we are told, can hold no political relations with the revolutionary politics of France and Italy based on the principles of 1789, but it can and ought to hold relations with all States "in all things of the natural order," so far as they do not violate the natural or divine law. But in proportion as the Governments of any countries are under the dominion of an erroneous religion, or of a schism, or of a royal supremacy, or of an imperial despotism, or of an anti-Christian revolution, the Church can hold no relations with them. It cannot condone the Lutheran heresy, or the Anglican schism, *or the four* (Gallican) *Articles of* 1682, or the Organic Articles, or the Russian Synod, or the Falk Laws, and the like. Still the Church is bound to do what it can for such misguided States—that is, for all the modern States of Europe—to preserve what remains in them of Christian faith and morals and to recall them to a more healthy condition. And in proportion as the civil power releases itself from the dominion of influences antagonistic to the Church, the relations between them may become more intimate. This is chiefly the case in Great Britain and the United States—we presume because the English Government is less "under the dominion of the Anglican Schism" than it was formerly, or in other words less closely connected with the Established Church, while there is no Established Church in America. In England there are no religious penal laws, "the Catholic Church has all its spiritual liberties," and there is hardly any branch of the public service into which a Catholic may not enter with a safe conscience. From this the inference is drawn that, in a country like England, for Catholics to hold aloof from the active service of the commonwealth is both a dereliction of duty and "a policy of effacement," which only their enemies can desire to perpetuate. That to a great extent they still do hold aloof, and that the whole British constituency "does not return a single Catholic to Parliament," must be traced to the lingering tradition of the penal laws. As regards the last point, however, we may remind the Cardinal that several Roman Catholics sat for English constituencies before the Papal Aggression panic, though we believe the la[illegible] Sir John Simeon is the only one who has been elected since. In France Cardinal Manning deplores that so many Catholics abstain from voting, while the rivalries and divisions in the Conservative party, "in which the sounder Catholic politicians are, or ought to be, found," still further weaken their influence. Their sympathies are with monarchy rather than with republicanism, but are divided between Imperialists and Legitimists. The Republicanism of France, we are to remember, is not that of Switzerland or America, but is distinctly anti-Christian; if it had its way, "the France of St. Louis would become, not the United States of America, which are just and tolerant in religion, but the France of Voltaire and Rousseau." It is striving by the Ferry Bills, as Germany by the Falk Laws, to expel Christianity from the education and formation of youth, and men, and nations, and political Cæsarism or the deification of the civil power must be the result. "There is not a Government in Europe,' adds the Cardinal—the italics are ours—"*except our own*, that did not use its influence against the [Vatican] Council and the Catholic Church. There is not a Government at this day, *except our own*, which has not a social

revolution at its back, urging it on towards manifest dangers and perhaps towards its ruin."

As to the Vatican Council, we doubt whether any European Government, except that of France during its earlier proceedings, used any influence whatever against it—by which the writer means against the infallibilists and in support of the Opposition—and the French Government did what little it did in that way in concert with leading French prelates like Archbishop Darboy. The English, Prussian, and Russian Governments had of course no direct concern with the matter, though it no doubt indirectly affected the first two, especially on account of their many millions of Roman Catholic subjects. The Roman Catholic Governments were exhorted to use their influence against the dominant Ultramontane party, and perhaps would have done wisely to pay more attention to the advice; but, however that may be, it came from no anti-Christian, or even anti-Catholic quarter, but from Prince Hohenlohe, then Prime Minister of Bavaria, who is, we believe, in the confidence of the present Pope, and whom Cardinal Manning will hardly venture to denounce as not "a good Catholic." He it was who justly pointed out in his despatch to the Continental Governments that the projected dogma of Papal Infallibility is also an eminently political question. But to turn to the general drift of the Cardinal's argument; if he is right in saying that nowhere does his Church enjoy such entire liberty as in the British Empire, and especially in some of its more recent colonies, and that ours is the only Government which is not threatened with a social revolution, what follows? This, for one thing—that a nation and Government which for three centuries and a half has broken with Rome, and which was always before that the most anti-Papal in its temper and legislation of any in Europe, is nevertheless now found, on his own showing, to be, if not the most Christian, certainly the least anti-Christian of any in the world. Of the Governments of France and Italy the Cardinal has not a good word to say; yet France was the eldest daughter of the Church, and Italy has been the cradle and the home of the Papacy. It is easy to reply that they have apostatised from the Church's rule, but it is under her teaching that they learnt the lesson of apostasy. We are far from saying that there is no truth in the reproaches hurled at the illiberal and irreligious, or anti-religious, spirit of modern French and Italian legislation, but under what auspices did that spirit grow up? What influences have made it what it is? France till a century ago, Italy till the other day, were held within the strictest bonds of "Catholic unity." In both countries "the education and formation of boys, youth, men, nations" was under the exclusive control of the Church. Yet "the children of the Crusaders" are what they are in France, and the Italian clergy—as Father Curci emphatically reminded them not many years ago—had the entire training and moulding of the generation who revile the Church, and affect to call themselves atheists. "Yes, gentlemen," he said, "with the temporal power of the Pope, with legitimate princes on the throne, with episcopal authority universally respected and the action of the regular and secular clergy unimpeded and in full operation, with full liberty to do whatever we deemed expedient, *we* have formed this flower of a laity." It may be replied that they have rebelled against their teachers, but why did they rebel? The fault cannot surely have been all on one side. There must have been something to provoke so fierce and so general a revolt from the teaching and tradition of centuries. The Church had on her side authority, prestige, exclusive command of the situation, that claim to divine guidance which Mr. Froude admits to be a most powerful element of her influence and which Cardinal Manning vindicates as her absolute and rightful possession. Yet the nations she ruled have fallen a prey to "anti-Christian revolution," while England alone stands firm, and alone guarantees to her, not indeed the privileges and domination she once enjoyed, but "all her spiritual liberties." The Cardinal has propounded and emphasized a paradox of which he offers no solution, and on the Ultramontane hypothesis it is very hard to find one. The more completely his indictment against modern society can be substantiated—and theorists differing from him as widely as Mr. Froude would agree with a good deal of it—the more perplexing does the problem become. We are not undertaking to solve it here, but we would venture to suggest to Cardinal Manning that in a study of the confessions of several Popes of the sixteenth century, the records of several Councils of the fifteenth, he might find a valuable aid towards a better comprehension of the subject. No pious believer, of whatever communion, can regard with anything like unalloyed satisfaction the present condition of the Christian world; but to say that, in proportion as they have listened to the infallible guidance of the Roman pontiff or rejected it, Christian nations have approached or deflected from the ideal standard of perfect holiness and truth, is a strange reading of history. It is the privilege of Ultramontane apologists to be *Papâ Papaliores*, but we doubt whether the present occupant of the Chair of Peter would be willing unequivocally to endorse the short and easy methods and sweeping assumptions of his Eminence of Westminster. It is satisfactory to find him able to speak so well of his country, but there is something a little odd in the intimate conjunction of praise of the British Constitution with rapturous devotion to the Vatican decrees.

THE DOCTOR IN THE KITCHEN.

SOME time ago we noticed a genial article by Sir Henry Thompson, in which that eminent surgeon, departing from a strictly scientific view of food and drink, considered dinners after the fashion of a gastronome, and in a manner calculated to try the nerves of a medical Puritan. Now another member of the same profession has given readers the benefit of his opinions on this interesting subject, which he has treated with quite as much liberality and quite as much disregard for austere rules as Sir Henry Thompson showed. Mr. Ernest Hart has commenced in the *Sanitary Record* a series of articles on the hygiene of food, and in the second of them he diverges, to use his own expression, "from the theoretical data of physiology and hygiene, to study practically certain kinds of dinners"—or, in other words, to try to point out what sort of dinner is most enjoyable. Few persons are likely to quarrel with him for his divergence, as most people who have any liking for good things or any feeling of hospitality are glad to know what a clever doctor who is not without human sympathies, and can throw aside for the nonce chemistry and physiology, has to say about eating and drinking.

A doctor, however, even when writing in this manner, is in one respect a doctor still. It is said that clergymen can never entirely forget the pulpit, and medical men can never quite get rid of the authoritative manner which belongs to their profession. In following it their business is not to argue, or to explain, or to suggest, but to dictate. It is for them to lay down the law, for others to acquiesce. When they address the outer world they are justifiably positive, as they are learned men addressing the ignorant. Not unnaturally, when they quit medical subjects and deal with others, they are apt to forget that they are no longer lawgivers, and notably is this the case when they deal with such subjects as the arrangement of flavours in a dinner or the dishes which should be served at a pleasant feast. Rules respecting these are not based on scientific knowledge or reasoning, and can only be drawn from the practice of the most accomplished gastronomes and the most skilful cooks. Doctors do not therefore necessarily speak with any special authority in this matter, but nevertheless they are sometimes not a little dogmatic. Sir Henry Thompson, who had some knowledge, but not a large knowledge, of gastronomy, was rather positive, and Mr. Hart, who has next to none, is still more so. He first of all describes dinners which, according to his ideas, should not be given, and then tries to set forth what a dinner should be. What he succeeds best in showing is that he himself has almost everything to learn; but it must in fairness be said that the remarks with which he begins his disquisition are sensible and worth attention. They are by no means new, and indeed have often been made before, but there is no harm in repeating them, for, as will be shown presently, much reiteration is necessary to convince the dinner-giver of his manifold errors. Mr. Hart's plaint at the beginning of his second article is against the established feast of the day, which has been attacked many a time, but which still seems dear to the hearts of free Englishmen. "Typically," says the assailant, "it runs thus:—'Clear' soup, thick soup, turbot, lobster sauce, oyster patty, sweetbreads larded, roast mutton, currant jelly, pheasant, quails," &c. Such a banquet is not perhaps so often seen as it was some years ago; but still it is served more frequently than it should be, as it is, in fact, only fit for undergraduates or for farmers at an annual feast; and if Mr. Hart had contented himself with setting it forth in all its naked horror, or had simply denounced it as a ponderous and ill-arranged meal, far inferior to an ordinary simple dinner, he would have done well, and might have awakened some people to a sense of their misdeeds. Unfortunately, he was not content to do this only, but determined to analyse his "typical dinner," forgetting that he was quitting his own province and venturing into that of the *chef* and the gastronome. The result is to make it clear that some culinary reformers, like improvised judges, should not give reasons. After finding fault, rightly enough, with the nastinesses known as thick soup and lobster-sauce, he goes on to complain of the oyster-patty, on the ground that it is generally badly made, but adds that, when really well made, "it is a costly as well as one of the most difficult achievements of skilled cookery." He might as well have said that a rissole is an achievement of skilled cookery The insipid little puffs of paste to which, for some incomprehensible reason, British matrons and British cooks are so devoted, rarely appear at French tables, and, when they do appear, are served as *hors d'œuvres* and not as *entrées*. Not a little amusing would it be to see the face of a great cook who was told that a *bouchée d'huîtres* was one of the most difficult achievements of his art. Very different, however, would be the views of any skilled man respecting the second *entrée* mentioned in talking of which Mr. Hart is almost as unfortunate as he is in speaking of the first. Having praised where he ought to have condemned without reserve, he condemns absolutely where he ought to praise He says that the extraordinary partiality for sweetbreads shown in English *menus* "must greatly surprise foreigners, who can hardly have imagined that so universally prevailing a sentiment existed in this country in favour of the thymus gland of the calf for the festive dinner-table." We doubt whether it can greatly surprise foreigners, as they have a strong liking for the thymus gland themselves. Even the grave *Dictionnaire de l'Académie* speaks of it as "un manger assez délicat," and a good many receipts for preparing it are to be found in French cookery-books. It would not probably be served at an entertainment of the first order, and no doubt English cooks

are much too fond of it; but, as every one who has studied the French kitchen knows, it combines admirably with certain sauces, into the mysteries of which we need not enter, as they are lightly flavoured by a certain bulb which is supposed to be held in horror by all but coarse-minded people, though as a matter of fact it is used for a large number of dishes by the best cooks. To speak of the "thymus gland" as Mr. Hart does only shows how little attention he has given to culinary subjects.

To follow him further in his analysis of the typical English dinner can hardly be necessary, since he blunders so about the most important portion, the *entrées*. As might be expected, when he abandons destructive criticism, and, having said what a dinner should not be, goes on to show what a dinner should be, he is still more unhappy. He begins by bidding the mistress of the house who would fain give a good dinner study Brillat Savarin, Hayward, and Walker, from not one of whom, as it happens, can any practical knowledge of how to frame an ordinary *menu* be obtained. Mr. Hayward's bright essay must please all who read it, and the "Original" is, as every one knows, quaint and amusing; but vainly will the hapless housewife search either for the information she wants. As for Brillat Savarin's *menus*, they were pronounced long ago by a very great authority to be "écourtés, vulgaires, quelquefois impracticables," and nowadays would seem almost ridiculous. What would be thought, for instance, of the following feast?—1. A large fowl stuffed with truffles "jusqu' à sa conversion en sphéroide." 2. A huge pâté de foie gras. 3. A large carp "à la Chambord," *i.e.* with a garnish of quenelles, mushrooms, and truffles in brown sauce. 4. Truffled quails. 5. A stuffed pike, with crayfish sauce. 6. A pheasant stuffed with a forcemeat of woodcocks. 7. Asparagus. 8. Ortolans flavoured with garlic. 9. Méringues. Certainly the master of a house who found that his wife's study of classical authorities resulted in such a bill of fare as this—which, it may be observed, is Brillat Savarin's proudest effort—would pray for a return to the sweetbreads and the saddle of mutton; and the mistress herself, when she got her weekly bills, would wish devoutly that the distinguished Frenchman had not put off till he was seventy years old that one visit to church which caused his death. Mr. Hart should have examined his authorities more carefully before he referred unsuspecting ladies to them; and we may add that he should have examined his cookery-books more carefully before he made some of the other suggestions which are contained in his remarkable essay. Thus, after saying that fish should be "rather provocative of appetite, and a refreshing vehicle of flavour, than in itself a substantial satisfaction to hunger," he says that a "sole normande," and some other preparations which he names, "should be among the first and simplest suggestions which should occur to the mind in selecting a course of fish." Now Sole à la normande is served with a very rich sauce, composed of fish stock thickened with yoke of egg, and with a garnish consisting of mushrooms, oysters, mussels, fried crusts of bread, and fried smelts, to which luxurious ragoût tails of crayfish or chopped lobster are occasionally added. An admirable dish it is; but unctuous and satisfying in a high degree. Even a man in training would hardly look upon it as merely provocative of appetite; and probably Mr. Hart has been the first, and will be the last, to take this view of a *plat* which may make rash men fit for very little more at dinner. Of his other observations there is scarcely any necessity to speak, as he obviously knows very little of the subject that he has attempted to treat. From the positive manner in which he writes he appears to think that a medical man has what we may term an *ex officio* knowledge of cookery. A short course of study will convince him and those of his brethren who may incline to this opinion that, to obtain this knowledge, medical men must travel by the same road as other people.

He is however, as we have said, quite right when he denounces the ordinary English dinner; and, if he had refrained from attempting explanation and criticism, his anathema would have carried some weight. Such denunciations of senseless adherence to a foolish practice are still needed; for, though the extravagance, bad arrangement, and general nastiness of the typical English dinner have been pointed out again and again, reform proceeds but slowly; and Englishmen seem to cling desperately to the practice of giving a hybrid meal, originally devised by some ingenious people who, without at all understanding the French repast, endeavoured to combine it with the English one and succeed in spoiling both. Not merely ordinary dinner-givers, but those who are supposed to have specially studied how to arrange and serve dinners, seem unable to learn anything, though patent faults have so often been complained of. A curious instance of this persistent disposition to err is afforded in a work recently published, called Warne's *Model Housekeeper*, intended as a companion to Warne's *Cookery Book*, of which a new edition has just appeared. The editor of the first-named volume states that it has been in course of preparation for more than three years, and as so much care has been taken, those who want to know what to give their friends will probably turn anxiously to the bills of fare which are offered. They will find that there has been a rigid determination to adhere to the preposterous old system. Here is what the model housekeeper, after three years' consideration, has to suggest for the month of January:—"Turtle soup; clear gravy soup; cod's head and shoulders; cutlets of sole; tendons de veau; stewed pigeons; rissoles; fillets of duck; saddle of mutton; roast turkey; potatoes; seakale; brocculi; partridges; grouse, &c." To criticize such a bill of fare would be a mere waste of time. Where everything is wrong it would be useless to select any one special feature for blame; but, to show what a French dinner really is, and how entirely it differs from the marvellous English caricature, we will give the *menu* of a dinner which was arranged by a French gastronome of considerable knowledge. It is as follows, the "Sorbet au rhum," which is now so common, being intentionally omitted:—Consommé; Turbot, sauce Hollandaise; Filet de bœuf, braisé au jus; Suprême de volaille aux truffes; Filets de canards sauvages à la Bigarade; Pain de foie gras (cold); Pluviers rôtis; Salade de légumes, &c. It is to be observed that this dinner, though certainly not of the most elaborate kind, can only be served by a very good cook, and that, though scarcely dearer than the terrible banquet of the *Model Housekeeper*, it is liable to objection on the score of expense. A good *menu*, however, is always to some extent elastic, and on an occasion when the services of a first-class cook were not obtainable, and when economy had to be considered, the author of this one modified it by substituting fillets of rabbits for the *suprême* and Poulets au cresson for the plovers. The dinner thus changed is considerably cheaper than that given in Warne, and both differ in every respect from the wonderful feast which it has taken three years to arrange. It is to be feared, however, that the English bill of fare only reflects with some exaggeration what the English host too often thinks it fitting to offer to his friends under the impression that he is giving them a French dinner, and doctors will render no small service to the community if, after proving that such a meal is unhealthy, they will point to good examples, and will show how repasts which are much more digestible and much nicer may be arranged. To do this, however, they must be willing to study the traditions and practice of the French kitchen, and they must not assume that a knowledge of the chemistry of food enables them to dogmatize about the pleasures of the table.

DECAYED CORPORATIONS.

THE Report of the Commission which was issued nearly four years ago, at the instance of Sir Charles Dilke, to inquire into the present state of the municipal corporations of England and Wales which have hitherto escaped the operation of reform, will not gratify those who long for stories of malversation and unholy gains. The successors of those who fifty or sixty years ago used to compile Black Books, Red Books, and other records of improperly acquired wealth will not find its perusal refreshing to their patriotic and virtuous souls. There is here entered no corporation like that of Queenborough, which in 1835 could boast of a revenue of fifteen thousand a year. The historically and dramatically famed hamlet in the Isle of Sheppey has indeed—thanks to the London, Chatham, and Dover Railway—become something less of a mere name than it was. But the treacherous oyster-beds which once made its corporate wealth have deserted it, or have passed into other hands; and Queenborough, though it is still far from being the poorest of municipal bodies, cannot boast of more than half as many hundreds of annual income as it once possessed thousands. Of all the rest (and there are some scores of them), only one has an income much exceeding a thousand pounds annually. This is the borough of Sutton Coldfield, of Falstaffian fame, which seems to be amply estated, and has nearly four thousand a year. No accusation of corrupt management is, however, brought against Sutton Coldfield, though, as is not surprising, those who have not a finger in the pie think that they ought to have, and some would have the pie itself constructed on a different model.

For the most part, the corporations enumerated in this Report come under three different classes, and each class is fertile in interest to those who can find pleasure in the contemplation of the changing forms and aspects of national life. There are boroughs in the list such as Alnwick, Lewes, Henley, and perhaps half a dozen others, which are still, if not exactly important towns, at any rate towns well enough to do in the world, counting their inhabitants by the thousand, and very far indeed from extinction. The curious thing in this class is that the corporation, though it exists and sometimes has fair property and influence, has in some odd way fallen apart from its natural duties, owing sometimes to vice of constitution, sometimes to mere accident, and remains a useless or nearly useless anomaly, while modern bodies such as local Boards perform with less dignity and appropriateness the functions which it ought to fulfil. In this case, of course, the obvious thing to do is to restore the corporation to its proper position. But the majority of the places enumerated in the list are not in this case. Some of them are towns which have to all appearance hopelessly lost all semblance of township, and are simply sleepy villages, sometimes with a hundred or a couple of hundred houses, sometimes with not more than half a dozen. No one who has wandered about the precincts of Winchelsea, or Orford, or Pevensey, or Dunwich, or Corfe Castle, but knows the type of this kind—a place which brings the fairy tales of his youth before him and in which it seems to be always afternoon. Last of all come places like Caerwys and Dinas and half a dozen other Welsh boroughs, where almost all character of what can fairly be called a community is lost, though in not a few cases the formalities of communal life and government are kept up. These last two classes naturally are those which in the Report are most fertile in interesting details. Sometimes indeed they have allowed their corporations wholly to expire, the process of decease being so gradual that the exact moment when life dis-

appeared is not known. At Fowey—not a place in the last gasp either—all that can be said is that somehow or other the corporation died between 1835 and 1850, all efforts to ascertain any more precise date being apparently futile. Newtown, in the Isle of Wight, a mere hamlet which pedestrians may remember on the lower road from Yarmouth to Newport, expired in a municipal sense in 1837. It died in the odour of sanctity, handing over its effects to build a church; while the regalia, and, if we remember rightly (though it is not mentioned in the Report), some furniture of merit, passed to Swainston, the seat of the Simeons. Bossiny, which men may better know by the name of Tintagel, though there is a difference, came to an end somewhat later and in a less regular manner. The last mayor is said still to collect for his own use certain infinitesimal tolls. A tiny slice of land with some buildings is in the possession of a tenant who (happy man!) has paid no rent for thirty years, for the tolerably sufficient reason that there is no one to pay it to; and the mace and cup are believed to be in the keeping of one Mr. Brown. In short, Bossiny, municipally speaking, has wasted away. Caergwele had, even in 1835, forgotten for centuries that it had a corporation, and has not taken the trouble to revive it since. Caerwys, another Flint borough, had, at the date of the former inquiry, an outward and visible sign of a corporation in the shape of a crier; but even he has now passed away. Castle Rising is dead. Rhuddlan is dead. So is Criccieth; so is Grampound. Indeed, a list of dead corporations could be prolonged to a considerable length.

There are, however, not a few places where corporate apparatus for municipal government does still exist, though it performs next to no functions. The most curious, perhaps, of all these is Dinas, in Merionethshire. Dinas has no property, and its corporation does not seem to have exercised, at any rate for a very long time, any particular function, except that the mayor claimed to sit as a magistrate. But the lord of the manor felt that it increased his dignity that Dinas should be corporate, and he accordingly kept the corporation, just as he might have kept a yacht or a pack of hounds, out of his own pocket, paying no inconsiderable stamp duties, &c., for the proceeding. At Kenfig, a village of some five hundred inhabitants near Bridgend in Glamorganshire, a very complete corporation exists. The property of this body extends to no less than 1,200 acres—which, it is fair to add, are only rough open ground. There are a portreeve, a constable of the castle, ten aldermen, a recorder, haywards, ale-tasters, constables, a town-hall, and a corporation rabbit-warren. It may be a little disturbing to modern notions to find that the surplus revenue of Kenfig is divided among the burgesses; but, as the gross income is estimated at 135*l.* per annum, it must be acknowledged that the individual amount of lucre is not great. Corfe Castle, on the occasion of the first inquiry—which, or one like it, is ridiculed admirably in *Crotchet Castle*—covered itself with glory by stoutly refusing information. Unless the then incumbents managed to annex most of the property, of which there is no hint, the reason for refusal could hardly have been any consciousness of malversation. The corporation of Corfe Castle is fully organized, but it does not appear to possess so much as twenty pounds a year. Nevertheless there is not only a mayor, barons, jurors, &c., but an ale-taster and a carnator, an officer whose office—under its modern title of sanitary inspector, or inspector of markets—some good folks doubtless imagine to be an invention of modern wisdom. At Harton—*i.e.* Hartland in Devonshire—there is no carnator, but there is a bread-weigher and, in addition, there is a scavenger. Harton has some small property which appears to be honestly applied to purposes of paving and so forth. Its officers have no salary, and it is therefore only fair that they should have, as in most cases they are reported to have, no duty.

We have said that any idea of corrupt bodies rolling in misapplied wealth is conclusively dispelled by this Report. The entire income of the sixty-three corporations whose revenue is scheduled amounts to about fifteen thousand a year—just that of Queenborough alone in its palmy days—and of this a single corporation, Sutton Coldfield, has more than one-fourth. The small sums which, ranging from thirty shillings to a few hundreds, come in to the others appear to be for the most part applied in one way or another to actual public service. Here and there a small residue is divided among the corporators, and a very few dinners and feasts are still given; but these things are decidedly the exception, and the sums so spent probably do not amount to five hundred a year for the whole kingdom. The actual complaints made to the Commissioners were also far from serious, often being the result merely of the usual local squabbles which constantly occur in small places. The Commissioners, however, may claim to have established three things. First, they have shown that there are a large number of purely functionless bodies in the kingdom, bodies for which in the circumstances no function is possible or at least obvious, and which sometimes, though not always, possess a little property which may be said to be at present wasted. Secondly, they have proved that in many cases the mode of election of the corporation is unsatisfactory, being by nomination of some person, by co-optation, or by other close forms of selection. Thirdly, they have shown that, in a few cases, there are corporations which have plenty of work to do and plenty of means to do it, but which, as a matter of fact, and for various causes, do not do it. In the last case—perhaps in the last two cases—the remedy is easy and obvious; in the former it is a question whether any remedy is required. The gain of interfering with such corporations as those of Kenfig, and Dinas, and Fordwich, is infinitesimal, and therefore interference (which means abolition) seems to be pure vandalism. The surplus funds might, as the Commissioners recommend, be very well handed over to the Charity Commission. But when this is done, it is not clear why Kenfig should not retain its portreeve and Corfe Castle its carnator. There is, moreover, one remark of the Commissioners which hardly, we think, shows the worldly wisdom to be expected from such a body. They say, as an argument for change, that "it has been mentioned to them as an evil arising from the close character of the elections, that different parties in politics and religion have not the opportunity of being represented on the corporation, and that persons holding views differing from the majority of the existing members are seldom elected." This is an evil certainly. But would the fullest application of the Municipal Acts remedy it? We are inclined to doubt it. There is a borough considerably larger than Kenfig or Dinas, and situate not a thousand miles from Sutton Coldfield, where it is credibly reported that members of a party different from the majority have exceedingly little chance of office under the corporation or of membership of it. There is another borough (more fortunate than Queenborough in having preserved its connexion with oysters), where it was reported after last autumn's municipal elections that a new party having come into power, they had on the American system made a clean sweep of every official, from town-clerk to scavenger, and put, as the seventeenth century would have phrased it, "honest men" in their places. Perhaps both these reports are libels, but they are sufficiently in accordance with human nature (which you can neither expel with a fork nor with an Act of Parliament) to make them at least probable. However, we shall be glad if the anticipations of the Commissioners are fulfilled. To the constructive part of their scheme, that which proposes to make bodies which are at present nearly useless useful in the direct sense of their original constitution, no one can wish anything but success.

REPORTERS AT EXECUTIONS.

DURING Mr. Cross's tenure of the office of Home Secretary he has more than once been appealed to, in different senses, on the question of the admission of strangers to be present at executions. When the practice of public hanging was first given up there was, as any one acquainted with English idiosyncrasies might have anticipated, a remarkable eagerness shown for a certain time and by a certain class of persons to obtain this admission. Public executions had for some time ceased to be a favourite amusement with Lord Tom Noddy, or even with persons of less exalted rank; but as soon as admission to private executions became a kind of privilege there were not wanting people who sought for it eagerly enough. Sheriffs and Visiting Justices vacillated a good deal in regard to the principle of admission or exclusion; but for some time it was more or less of an understood thing that "representatives of the press" were allowed. Thereupon followed two very simple and easily foreseen consequences. In the first place, the representatives of the press, as in duty bound, strove to compensate the mass of their readers as much as possible for the loss of their old amusement of beholding the dying struggles of a criminal. The kind of representative of the press who is generally detailed for such duties is nothing if not picturesque, and very picturesque indeed some of these gentlemen manage to be. But this was not all. The press is a very vague term, and the exact definition and verification of a representative of it is by no means easy. Local men might be known, but the exclusion of representatives of the press who were not local would have been illogical. It was obviously not at all difficult for a not very scrupulous person with a hankering for horrors to represent himself as a commissioner of the "Little Peddlington Gazette" or the "Kennaquhair Banner," and the Sheriffs or the governor of the gaol had for the most part too much to do to examine his credentials very narrowly. A practice, and we think a very praiseworthy practice, has therefore grown up of rigidly excluding all but official personages who have a real duty to discharge. Mr. Cross, the Home Office having no direct control over the arrangements of executions, has not much to do with the matter. He did, we think, once issue an eccentric order which occasioned a good deal of amusement at the time, authorizing the admittance of relations of the prisoner to witness his more or less unhappy despatch. But for the most part, as we have said, the Sheriff is theoretically supreme over the details of the execution itself, and the Visiting Justices, though less supreme than they once were, are still nominally masters of the building where it takes place.

A few days ago a man named Cassidy was executed at Manchester for a peculiarly brutal murder, and the representatives of the press were excluded. Outside observers who do not share the taste for hanging may yet have noticed that the more brutal the crime the more lively is the interest that is felt in the criminal. Some good people in Manchester appear to have been aggrieved at their exclusion and the exclusion of the "descriptive" reporters who might have given them something to gloat over. The necessary coroner's inquest, moreover, gave an opportunity of putting this discontent into shape. There is very often a kind of undefined grudge between coroners and the more powerful departments of the law; and something of the kind seems to have manifested itself on this occasion. A juryman took it into his head that Cassidy had had too long a drop—a thing which, still speaking as mere outside observers,

we had always considered to be rather a favour than a hardship. The Governor of the gaol was badgered to say how many feet and inches the drop really was; and, his answers not being considered satisfactory, Mr. Hibbert put a question to Mr. Cross on the subject, to which practically two answers were given, on Thursday in last week and on Monday in this, the second being in reply to an inquiry made, not by Mr. Hibbert, but by Mr. Pease. This last was, at least as reported, not quite so satisfactory as the former. It contained, indeed, the important fact that the drop was not 9 feet 6 inches, as had been alleged, but 8 feet; and this will, we hope, satisfy the Manchester critics, who are probably better acquainted than we are with the exact height from which it is proper to conduct the operation. But, whereas in his first answer Mr. Cross seems to have been quite firm as to the question of admission of reporters in the second his reply was ambiguous, not to say weak. He said to Mr. Hibbert that it had been found that the admission of reporters invariably led to the publication of details which must have a bad effect; that the Sheriff and the Visiting Justices were the actual, and fully sufficient, arbiters of the matter; and that he could not see that it was desirable to interfere with their decision. But the answer to Mr. Pease included, as reported, the statement that "he would communicate with the authorities and see what could be done." Now, as in the case before him reporters were excluded, it is clear that the only thing that "could be done" is not to exclude reporters.

If this is a correct interpretation of Mr. Cross's words, we venture to think that he has made a great mistake in abandoning his first position. We cannot see a single argument of weight for the admission of representatives of the press on such an occasion. It is idle to pretend that such admission is required to prevent irregularities. Considering that an execution is practically controlled by three different authorities, the gaol officials, the Visiting Justices, and the Sheriff, each of which is more or less independent of, and therefore competent to act as a check on the others, and that the inquest comes in as a fourth, it is pretty certain that there can be no danger of any impropriety occurring which the presence of half a dozen or half a hundred picturesque scribes with note-books would do anything to prevent. On the other hand, the presence of the picturesque gentlemen and their note-books goes far to neutralize whatever good was expected or intended from the prohibition of public executions. It does away with the mystery, or semi-mystery, of the death, which has no insignificant effect in increasing its terror. And it substitutes for whatever there was degrading in the old practice a degrading influence somewhat different, it may be, in kind, but by no means less bad in degree, and extending to a much larger number of persons. The largest crowd that ever pressed round an execution is a mere insignificant handful compared to the number of readers, not merely of the metropolitan journals, but of those of towns such as Manchester. To these masses of readers the details of the prisoner's mental and bodily suffering are given, drawn by pens which aim at nothing but glaring colours and prominent outlines. It is impossible that such accounts should have the least deterrent or reformatory influence, and it is very possible indeed that they may have no small influence in degrading the taste and cultivating the appetite for coarse food. If Mr. Cross really thinks as he thought some time ago, that it would be a comfort to the relatives of a ne'er-do-weel to be quite sure of his having gone over to the majority, let him by all means make arrangements for their admission, always taking care that the relationship is sufficiently made out. But if the general public have no need to see with their actual bodily eyes the ghastly preliminaries and circumstances of the last act of the law, no more have they any need to see them through the telescope of a "smart paragraphist," as advertisements sometimes describe the class of men of letters who affect this department of literary work. The smart paragraphist is an exceedingly doubtful moral influence in such a case; as an æsthetic influence he is not doubtful at all. All that the public has a right to know, when it has once decided on the principle of the privacy of executions, is that these executions have been carried out with due skill and on the right person. As we have seen, the law provides official witnesses of so diverse a character, appointed in such different ways, and representing so many different classes of the community, that there is no reasonable cause whatever to doubt the propriety of the arrangements carried on under their supervision. It has taken these authorities some time to come to the sensible conclusion that it is no part of their duty to furnish local newspapers with exciting "copy," or to stimulate the local youth to "play Peace" with one another, as happened not long ago, by scientific descriptions of the method of suspending criminals by their necks until they are dead. It would be a thousand pities if this conclusion, which is in every way for the public good, should not receive the support it deserves from the Government and the public themselves.

OLEOMARGARINE.

THE correspondence just published concerning the manufacture of oleomargarine in the United States, has a considerable and not altogether a pleasant interest. Just as in the American tongue window-blinds mean venetians, and boots nothing under a Wellington, so oleomargarine is a fine name—for which it would seem, however, that a Frenchman, and not an American, is responsible—given to an article of commerce which there is too much reason to fear is largely sold as the best butter, while it has really no more relation to butter than pinchbeck has to gold. A certain M. Mège, it appears, some time ago hit upon an ingenious process, which is grandiloquently indicated in a number of the *New York Advertiser*, dated 2nd of February, 1878. "The rapid growth of the business" (of manufacturing sham butter), said this paper, "in this country indicates very clearly that the discovery made by M. Mège, who established the identity of the limpid and odourless oil of fresh beef fat with the oily element of cow's milk, came in time to meet a present want, just as petroleum was discovered when the whale-fishing began to languish, and gold when the world's supply of the precious metal was running short." In the same way, a grocer emancipated from ordinary prejudices might speak of the fortunate discovery of sand when the supply of sugar began to languish, or of the "present want" of genuine tea being happily met by an ingenious manipulation of sloe-leaves. The processes by which M. Mège arrived at what are perhaps not unjustly called "his extraordinary results" have, we are told, "been vividly described by M. Felix Blondel, in a paper published in the *Moniteur Scientifique*." "At his farm in Vincennes M. Mège placed several milch cows on a strict diet, found that they soon decreased in weight and in the yield of milk; but their milk always contained butter. This led to the conclusion that the butter was produced from the fat of the animal, which, being re-absorbed and carried into the circulation, was deprived of its stearine by respiratory combustion, and furnished its oleomargarine to the udders, when, under the influence of the mammary pepsin, it was changed into butyric oleomargarine—that is to say, into butter." After this assumption, or hint, that oleomargarine is identical with butter, one is not surprised to learn that "the way was then opened to the production of an article precisely the same as milk-butter." In September of last year, Consul-General Archibald, of New York, wrote in a letter to the Foreign Office concerning the manufacture of this "article precisely the same as milk-butter," that, "during the last two years, the quantity of fat manufactured into oleomargarine and oleomargarine-butter by the Commercial Manufacturing Company has been, it is stated on reliable authority, about 200,000 lbs. per week, yielding 80,000 lbs. of oil and butter. Of this, about 75 per cent., or 60,000 lbs. per week was the *oil* product 'oleomargarine,' all of which was exported, in barrels or tierces, for the most part under the name of 'oleomargarine,' but sometimes as 'butter fat,' or simply as 'oil.'" Thus the Company above named has exported alone about 3,000,000 lbs. annually; but to that must be added an equal quantity exported by outside manufacturers. The shipments of the outside manufacturers "are made to Hamburg, Bremen, and other German ports, also to Rotterdam, but none, as I am informed, to the United Kingdom." It is, however, natural to conclude that some of it finds its way to the United Kingdom in addition to the products of the Commercial Manufacturing Company, which, from a place called Oss, where they undergo a process which is intended to make them look and taste more like real butter, are reshipped "to France and England, but chiefly to England, under what designation I am unable to ascertain." Probably, it will be thought, under most designations which are calculated to persuade a purchaser that he is buying the purest and most carefully made milk butter. It is not easy, Consul-General Archibald goes on to observe, to ascertain if shipments of this article from New York are sometimes made as of genuine butter; but, from inquiries made of the steamship Companies, he has discovered that "the consignments of the butter products are chiefly made by their steamers under the designation of 'butterine.' The article is put up in half tubs or firkins in precisely the same way as butter, and the tubs are enclosed in crates to protect them from injury on the voyage. It is also made up into 1 lb. pats covered by muslin or thin cotton wrappers, stamped as genuine butter is stamped, and packed in boxes for shipment."

These facts are significant enough, and with his account of them Mr. Archibald transmits various extracts relating to the manufacture of oleomargarine and to its healthfulness as an article of food. Opinions naturally differ on this point. The Prospectus of the Commercial Manufacturing Company backs its appreciation of its own wares by a quotation from the ninth edition of the *Encyclopædia Britannica*, under the heading "Butter," which points out that, according to French official reports, there is more in the way of food to be got out of artificial than out of real butter, and that the substitute is perfectly wholesome. It also observes that the same *octroi* duties are imposed on the sham as on the genuine article in France; and asserts that "there can be no doubt that a pure, sweet fat, such as is manufactured by the process of M. Mège-Mouries, is a safer and more wholesome article than the unsavoury, rancid butter which is sold so freely among the poorer classes." This, considering the qualities of "unsavoury, rancid butter," is perhaps a tolerably safe assertion, which rests, however, upon the assumption that the mechanical butter, so to call it, is pure and sweet. This assumption was not accepted by Mr. Michels who in 1878 addressed a letter to the *American Dairyman*, in which he gave an alarming account of a microscopical examination which he had made of specimens of true butter and of oleomargarine. He found, he said, striking differences between them, and was of opinion that the animal fats from which oleomargarine was made were probably so substantially uncooked that poisonous elements or living parasites might be retained in an active form in the oleomargarine as finally supplied to consumers.

He also observed that "the prospectus of the companies states that the caul fat of the ox only is used for making oleomargarine, but I have reason to believe that the refuse fat of at least one pork-packing establishment is used. Thus already a departure is made from the programme, and as the trade increases fat of every description will probably be offered for sale, and even that from the carcases of diseased animals may be purchased without guilty knowledge by the managers."

Mr. Michels was answered in the *New York Times* by Professor Mott, who controverted all his assertions, and quoted a letter from Professor Arnold, of the Medical Department, University of New York, who had "made a careful microscopical examination of the sample of caul fat, stearine, and oleomargarine which you placed in my hands. These substances are entirely free from any impurity or injurious material detectable by the microscope. I have also submitted the oleomargarine butter to a similar examination, comparing it with natural butter, and find the oleomargarine butter to consist of exceedingly clear and beautiful oil globules, a sufficient proof of its purity." "Exceedingly pure and beautiful oil globules" are, no doubt, in some conjunctions a very desirable article of food; but, so far as we know, they are certainly not butter. The controversy took a more lively turn in the reply to Professor Mott's answer, which appeared in due course in the *American Dairyman*, and in the course of which this somewhat curious statement by Mr. Michels was cited. "Mr. Michels says that, on applying to the *New York Times* Office, he was candidly told by the editor-in-chief that the letter to which Dr. Mott had signed his name was nothing but an advertisement from the oleomargarine factory; that, in fact, they had received hundreds of dollars for its insertion, and that therefore no reply would be permitted to me. . . . I state these facts and leave them without comment; for if honoured names and great institutions can thus be used to advertise a grease factory, abuse rather than praise must be welcome from such a source." The facts, if correctly stated, are certainly startling enough. The writer of the reply just quoted makes in the course of his long letter one remark which is peculiarly to the point. "If," he says, "as is stated, a single manufactory in New York is producing 100,000 lbs. a day of the compound (and there are seven of these concerns in that city, to say nothing of others in different localities) how long will it take to drive genuine butter out of the market, especially if, as is claimed, the bogus stuff can be so scented and flavoured as to prevent its being distinguished by the taste or by other means than a scientific examination?" Even the test of a scientific examination cannot be implicitly relied on, not only because of such differences in the opinions of experts as have been shown by the foregoing extracts, but because also the specimens submitted may differ. We remember a case in which a certain article was submitted for analysis by its proprietors to a distinguished analyst, who thoughtfully provided himself with another sample of it bought in market overt. His report on the two samples pleased the proprietors so much that they kept it entirely and solely for their private entertainment.

While it may be uncertain whether or how far the substance called oleomargarine is objectionable as an article of food, it is quite certain that it is not butter, and, it is to be feared, equally certain that it is extensively sold as butter of exceptionally prime quality at exceptionally high prices. Many years ago Dr. Wyntor revealed some depths of iniquity in the adulteration trade, the meanest perhaps, if not the most dangerous, of which was that P.D., or pepper-dust, was frequently sold as pepper, and D.P.D., or dust of pepper dust, as either pepper dust or pepper itself. Something like this, in addition to what is already done with oleomargarine, might well have happened in this case if the matter had not been made public in a Parliamentary paper. It is to be hoped that now that this has been done the thing will not be allowed to drop.

THE MONEY MARKET.

THERE is much discussion in the City concerning the prospects of the money market. The value of money so largely affects all kinds of business in which the use of borrowed capital is necessary, that the matter is one of great practical moment. Low rates favour speculative enterprise, and, when trade is improving, encourage people to extend their transactions. On the other hand, when bankers exact high terms for the accommodation they afford their customers, the latter have to consider carefully whether the undertakings in which they are about to embark will bear the cost. In the early period of a trade revival, then, cheap money is of great advantage. During the past two months the course of the money market has seemed anomalous, and even yet there is much uncertainty as to the prospects of the immediate future. In reality, however, there is nothing puzzling, or even extraordinary, in what has occurred. During the long depression immense sums of loanable capital had accumulated in the banks throughout the country, and rates in consequence had fallen to a very low level. This continued until the export of gold to the United States became large, when gradually the value of money began to rise. The usual autumn outflow of coin to the provinces gave additional impetus to the movement. We can trace all this very clearly in the weekly returns of the Bank of England. At the end of July the coin and bullion in the Bank amounted to 35,900,000*l.*; at the end of December they had fallen to 27,600,000*l.*, showing a decrease of over 8¼ millions. At the end of July, again, the open market rate for three-months' bank bills was ⅞ per cent.; at the end of December the rate had risen to 2½ per cent. We thus see how the value of money kept pace with the diminution in the stock of coin and bullion. Before the old year ended the gold export to the United States had ceased; and, with the opening of the new year, the dividend payments let loose funds which for some time before had been accumulating; while the banks, having made up their accounts and shown satisfactory balances, felt at liberty to reduce them again. The result, as might have been expected, was an abundance of money in the loan market, and consequently a fall in its value. Before the end of January the open market rate for three-months' bank bills had gone down to 1½ per cent. With February, however, a fresh rise began; and in the middle of the present week three-months' bank bills were quoted outside as high as 2⅞ per cent. The question is, will this upward movement continue, or is it merely temporary? Business men, and many of the writers of City articles, have been surprised because rates fell so suddenly and heavily last month. They argued that the greater activity of trade, having enhanced the value of money in the autumn, ought to have kept it up in January, and they were at a loss to account for the fall. Now they reason that, bills being still scarce, the upward movement is entirely artificial, and will not last beyond the end of next month. In all this there is utter misconception. The greater activity of trade had little or nothing to do with the enhancement of the value of money last autumn, which, as we have just shown, was caused by the export of gold to the United States. As a matter of fact, a trade revival in its early stages scarcely affects the money market. The preceding period of depression has weeded out the weak traders who depended entirely upon credit, but it has left the strong men who have capital of their own. Moreover, it has enforced upon them economies in all departments, and thus has made possible a large production at a small cost. It has also taught extreme caution; and for a considerable time men refuse to trust others, parting with their goods only for cash. It is not until the revival has passed out of the stage in which doubts are entertained of its permanence, and has entered upon that in which everybody is sanguinely looking forward to making his fortune and is equally hopeful of his neighbours, that it reacts upon the value of money. Then wages run up bound by bound, prices become exorbitant, the cost of production is greatly increased, while business is extended in all directions, and transactions are largely multiplied; the consequence of all which is that every one begins to need additional capital. We are still far from this stage, and therefore may leave out of consideration the greater activity of trade.

The causes which during the past two or three weeks have been sending up the value of money are plain enough. First, and most potent for the moment, is the collection of the revenue. When Mr. Lowe, during his Chancellorship of the Exchequer, provided himself with a surplus by collecting five quarters' taxes in a single twelvemonth, he made a change which exercises an unforeseen influence on the money market every February and March. His innovation throws into the first three months of the year so large a proportion of the revenue payments that it takes out of the open market much of the loanable capital, and hands it over to the Bank of England. For example, on New Year's Day, 1879, the Government deposits in the Bank of England amounted to 4,900,000*l.*; on March 26 they had risen to eleven millions. In the three months, that is, over six millions had been taken out of the open market and lodged in the Bank of England. This transference of loanable capital diminished the lending power of the bill-brokers and the smaller credit houses, while it increased enormously the Bank's control of the market. In the present year the Government deposits have risen from 4,100,000*l.* on January 21 to 7,300,000*l.* on February 18, being an increase of 3,200,000*l.* in four weeks. And in these four weeks the outer market rate went up more than one-half per cent. By the end of March another four millions may be expected to be added to the Government deposits, and with the addition it may be reasonably assumed that the value of money will tend upwards. A variety of other temporary causes are aiding this one. Since the beginning of the year speculation on the Stock Exchange has assumed exceptionally large proportions, and as each fortnightly settlement comes round, the demand for loans, to carry over transactions, is active. The settlement immediately preceding that which was concluded yesterday was, we believe, the heaviest on record, and in many cases the charges made for carrying over were extremely onerous. Since then speculation has received a check; and at one time there was a considerable fall of prices, which is said to have lightened the account. But this week there has been a recovery, and there are symptoms that speculation will make a fresh start. If so, the demand for advances will continue. Another circumstance tending to keep up rates is the continuous export of gold. The outflow to the United States, as we remarked above, ceased before Christmas, and is not likely to begin again for the present. But week after week small sums are taken for Egypt and South America, and though the sums in each case are small, in the aggregate they reach a considerable amount. It is true that the stock of coin and bullion in the Bank of England has increased since the beginning of the year; but it has done so only because gold has been returned from the provinces in such quantities as to overbalance the export. This does not really mend matters; it only brings into view what was before not apparent. Coin

which a few weeks ago was held by bankers all over the United Kingdom is now accumulated in the Bank of England. It does not make up for the export to which we have referred, nor does it really add to our resources, though it may make them more easily utilized.

The causes we have hitherto been tracing are temporary in their nature. The pressure of the revenue collection will cease at the end of next month, and shortly afterwards the Government deposits will be dispersed in dividend and other payments, and the Bank of England will lose the control over the market which it owes to their accumulation. The Stock Exchange settlements can hardly in themselves exercise any important influence upon the money market. And the export of gold, if it be confined to Egypt and South America, is a mere driblet of the international bullion movement. What, then, are the permanent causes affecting the value of money? Chief amongst them is the production of gold; and, as we have often pointed out in these columns, this has for years been decreasing. Since the United States began to prepare for the resumption of specie payments, they have used up the whole supply furnished by their own mines, and in addition they last year took about sixteen millions sterling from Europe. The appearances are that they will again this year retain their home yield. Russia and Germany are barely supplied by the produce of the Russian mines. Consequently, other gold-using countries have to depend upon Australia alone for what they need to make good the wear and tear of their coinage, and to enlarge its volume. But the production of the Australian mines has been falling off for a long time, and this year it has decreased enormously. The shipments of gold from Australia have been unusually small, and at present no more than 150,000*l.* is known to be on the way to this country—a sum which would not make good half last week's exportation. It is clear that this increasing scarcity of gold must sooner or later enhance the value of money. If Mr. Brough Smith's reports on the Wynnad district prove correct, we may no doubt hereafter expect a considerable increase of our gold supply from India; but that will take time to bring about, and we are now considering only the near future. As we have already observed, the United States will probably retain the stock they now possess, in addition to what will be raised in the present year; that is, unless we in this country bid so high as to attract gold across the Atlantic. But this would imply an extraordinary enhancement in the value of money. Money on call in New York bears five per cent. interest at this moment; and before gold could be attracted to this country, it must not only bear a higher interest here, but the cost and risk of bringing it over must also be covered. It is very clear, then, that the value of money will not be kept down by imports of gold from the United States. As regards the Continent, it is less easy to speak with any confidence. Immense quantities of Stock Exchange securities have been bought of late from France and Germany, and the natural inference would be that we are in debt to those countries; but the exchanges seem to say the contrary. There is also another class of considerations to be taken into account. Apprehensions of war in the coming summer prevail very generally. If war breaks out, it will certainly cause the transference to this country for the sake of safety of an immense loanable capital. This happened in 1870, and it will unquestionably happen again, even though we ourselves should be involved in the struggle. The natural tendency of an influx of new capital is of course to depress rates, and that tendency would assert itself in the long run, supposing the war to be short, and not to lead to the issue of immense loans. But this would only be after a while. The first consequence of an outbreak of war on a large scale would be a panic, more or less diffused, and a sudden and very great rise in the value of money. Even if war is happily avoided, there are causes for anxiety and uneasiness which may go far to check enterprise on the Continent, and may prompt timid people to remit money to this country for safety. On the other hand it is also possible that the confidence in the preservation of peace which was so strikingly exhibited by the capitalist class all through the Eastern complications, and which is still shown in spite of the increase of the German army, the attempts on the Czar's life, and the *Italia Irredenta* agitation, may continue to maintain itself. In that case, money is as likely to go to the Continent as to come thence. On the whole, it seems probable that the value of money may continue to rise next month, and that during the spring and early summer it may maintain a moderately high level.

THE CARL ROSA OPERA.

ONE of the most interesting performances given by Mr. Rosa this year is that of *Rienzi*, produced by him so successfully during his last season in London. The work itself we discussed fully on its production last year, and we need only now point out that by its being performed in the same season with *Lohengrin*, we are enabled to contrast the composer's manner of treating grand opera with the dawn of his later method of music drama. Herr Schott made his *début* in England in this opera. Though at first his voice was much affected by our climate, and he had not quite accustomed himself to the higher pitch of the orchestra, still his performance was one of exceptional merit. The accidents we have mentioned made the peculiar quality of his voice more remarkable than it was when he sang *Lohengrin*, by which time they had been to a great extent overcome. His great *forte* as a singer is musical declamation, and most of Rienzi's music is declamatory. His fine appearance and dignified bearing are well suited to the part, and he fully enters into the spirit of the many strong dramatic situations. As a minor point, but still one of some importance, we must notice his admirable horsemanship, which made the great scene of the gathering of Rienzi's troops really impressive, instead of ridiculous, as it too often is. Granted that the horse he rides is well trained, yet even a trained horse requires a good horseman to manage him, and nothing could be more skilful than Herr Schott's management of his charger, giving as he did an air of reality and life to the scene with only a few feet of space in which to manœuvre; and he by no means brought his horse to rest when he had to sing, but kept the animal in constant movement whilst he delivered the address to the armed citizens and joined in the battle-hymn. The important character of Irene, Rienzi's sister, was taken by Mlle. Lido. All that could be done for the part by thoroughly skilful vocalization she did, but her worn voice and want of dramatic feeling prevented her from doing it justice. At times the great dramatic power of the music seemed to carry her away, and give some life to her acting and some meaning to her singing; but, on the whole, her performance was tame and spiritless Miss Josephine Yorke was admirable as Adriano, Irene's lover; she not only sang the music thoroughly well, but acted the part with much meaning and without exaggeration. Miss Albu, who, we believe, has not appeared in London before this season, sang the small part of the Messenger of Peace. She has a beautiful voice, and has had good training; her production is excellent, and her method generally very good; even this small part shows that she has much musical feeling, and altogether she bids fair in time to take a high place amongst our English operatic singers.

Mr. Snazelle deserves great praise for his performance of Cecco del Vecchio; his admirable pantomime did much to help the general effect; we may especially notice the scene just before the excommunication of Rienzi, when Cecco and Adriano stand ready to assassinate the Tribune, the way in which Mr. Snazelle indicates by change of facial expression and of attitude the gradual repentance of Cecco during Rienzi's speech being a really fine piece of acting. The other parts were well done, the cast being—Stefano Colonna, Mr. Leslie Crotty; Paolo Orsini, Mr. Walter Bolton; Raimondo, Mr. George Conly; and Baroncelli, Mr. Dudley Thomas. The chorus were excellent throughout the opera, and the band, under Signor Randegger, admirable. We may indeed almost venture to say that a finer performance of the overture has never been heard in England. Mr. Betjemann's arrangement of the crowds was excellent; and the scene after the fight between the Colonnas and the Orsinis and the scene of the burning of the capital are triumphs of spectacular stage management.

Mr. Rosa has added Ambroise Thomas's *Mignon* to the *répertoire* of his company, and has wisely restored it to its original form by cutting out the recitatives which have been added to fit the work for the Italian opera stage and replacing them by spoken dialogue. The ear being no longer wearied by the long, tedious, laboured recitatives, the merits of the music are more apparent, and its many defects press less upon the attention. This opera also owes much of its success to the stage manager. The scene at the commencement of the first act, with the gipsy performance and Mignon's first entry, was capitally arranged. Mr. Betjemann himself playing the part of Giarno with great spirit; his powers as a violinist enabled him to play the prelude to Mignon's dance himself. An excellent figure in this scene was an old, decrepid gipsy, who acts as Giarno's factotum The stage management of the fire scene was also very good; the crowd rush away from the house in terror on the alarm being first given; and this movement, as well as the hurry and bustle of the attempts to put the fire out, was admirably executed. Mr. Joseph Maas sang Wilhelm Meister, and the music suited him admirably; his voice, without having lost any of its beautiful quality, seems to have gained much in power, and neither hard work nor carelessness has injured his excellent vocalization, and his singing was so good all through the opera that it is difficult to select any particular instance of exceptional merit; perhaps his singing of the beautiful passage "Adieu, Mignon," was the most effective. Without being able to say that he acted the part at all, yet he must be given credit for the workmanlike way in which he walked through it. If there is not much to praise, on the other hand there is nothing to find fault with. Mr. Leslie Crotty was Lothario; he sang the music extremely well, and followed the usual colourless traditions in the histrionic representation of that gloomy and thankless part. Mr. Charles Lyall was good as Laertes; but rather too much inclined to buffoonery of a not very refined character.

On the occasion on which we heard the opera Miss Josephine Yorke sang the part of Frederick in place of Mme. Selina Dolaro, who sang the music well. Miss Georgina Burns was an admirable Filina; the quality of her voice is well suited to the music, and her fluent, easy vocalization enables her to give full expression to the sentiment of the music even in the most florid passages, whilst her acting of the part was thoroughly arch and coquettish, without ever being ungraceful or coarse. Miss Julia Gaylord made a really great artistic success as Mignon. The part suits her well, giving as it does ample display for good and varied acting without making any prolonged strain on the physical powers. Her singing was excellent, and her great power of clearly pronouncing her words and giving them their true meaning, without disfiguring the music, has never been better shown.

Thus she made a strong effect in Mignon's song, "Know'st thou that dear land"; her singing of the words "'Tis there my heart so longs to live" being a triumph of true dramatic singing. As to her acting, every phase of the character was equally well shown; the sullenness under ill-treatment, the tender worshipping love, the childish merriment, or the fierce passion of jealousy—all were admirable. The general performance of band and chorus was good, though the band was not quite so well together under Mr. Perio as it is under Signor Randegger, and, further, Mr. Perio very nearly destroyed the effect of the *gavotte entr'acte* by making the pause far too long.

The English version is by Mr. Arthur Matthison, and it is by no means good. There is often a strong flavour of the style of the translations of Italian libretti generally sold in our opera houses, and very frequently the singers are obliged to alter the words, as the text is not adapted to the music. Another opera has been produced for the first time in English this season, Signor Verdi's *Aïda*. The English version in this case is by Mr. Henry Hersee, and again we cannot say that the work is good. Act the second opens with this chorus:—

> He comes, with plaudits welcomed
> Due to the deeds he has done;
> The hero, clad in armour bright,
> Refulgent as the sun.
> Oh! hasten, let us deck thy brows
> With laurels and with blooming flowers!
> The hymn of glory soon shall blend
> With strains from love's soft bowers.

We regret to say also that this opera does not appear to have had the advantage of Mr. Betjemann's attention. The stage-grouping and the processions are left entirely as they were arranged at this house during the Italian season, and showed obvious signs of want of rehearsal; otherwise the performance was very good. The part of Radames suits Mr. Maas well, and he sang it admirably. Mr. George Conly was quiet and dignified as Ramphis, and his fine voice was heard to great advantage in the music of the part. Mr. O'Mahony, whom we have not heard before, sang the King. This part gives no opportunity for acting, so we are unable to form any opinion as to his dramatic powers; but he has a very beautiful voice, and a good method of singing, so that he will doubtless prove a valuable member of the company. Mr. Ludwig was good as Amonasro. Miss Yorke was, on the whole, very successful in the part of Amneris; she controlled her tendency to exaggeration of facial expression, and was quiet and dignified; she was unable to do much with the very difficult scene where Amneris listens to the trial of Radames, but wisely did not attempt to do anything beyond her powers. Miss Minnie Hauk's Aïda we cannot praise. The strong dramatic feeling which she has shown in some parts was entirely wanting, whilst her fault of elaborate and meaningless gesture was made painfully obtrusive; nor were these mistakes in her acting redeemed by any display of good singing. Here, again, her faults seem to have grown upon her, and her singing of the part was disfigured by faulty production of the voice, affectation in phrasing, and bad pronunciation of the words. The chorus and band, under Signor Randegger, were all that could be wished; and the performance of the work, taken as a whole, quite worthy of Mr. Carl Rosa's reputation.

REVIEWS.

THE ADMINISTRATION OF JOHN DE WITT.*

WHEN, about a year ago, the tercentenary of the event which opens the history of the United Netherlands was celebrated with patriotic rejoicings from the Maas to the Ems, it must be confessed that Europe at large, and England in particular, preserved an attitude of what strongly resembled indifference towards this national jubilee. And yet, in the case of our own country at all events, there was nothing to restrain an adequate demonstration of sympathetic goodwill. The international relations between England and the Netherlands, and the sentiments which those relations have produced, have indeed been subject to an unparalleled series of violent fluctuations, differing from one another as the Puritan enthusiasm of Spenser for the cause of the Lady Belge differs from Dryden's courtly abhorrence of the ill-natured and ill-mannered descendants of the authors of the Amboyna tragedy. Even in the second quarter of the present century, it was only after wishing to uphold Dutch policy, though on the side of injustice, that English popular opinion was brought to a fairly unanimous recognition of its error of judgment. In still more recent days we have been able to give ourselves up without reserve to the impressions of remoter historic memories; and one of the most brilliantly successful historical narratives composed in this generation has largely contributed to revive in Englishmen the admiration due to the great Dutch struggle for freedom, to which the aid of Elizabethan England was so tardily and so imperfectly given. A more than usually enduring phase of artistic taste and *dilettante* fashion has contributed its influence towards the same result, and had it but suited William the Taciturn to bring about the Union of Utrecht at a more convenient season than the dead of winter, its celebration would hardly have been allowed to pass by unnoticed, except here and there, among ourselves.

It is all the more gratifying to find that the year 1879 was not to close without having produced the first instalment of an English historical work which promises to form a most valuable addition to the generally accessible sources of information concerning one of the most interesting, and at the same time most complicated, periods of Dutch political life. If Mr. Geddes has been fired by the honourable ambition of worthily carrying on the thread of Mr. Motley's labours, the conception of the *History of the Administration of John de Witt* is not the less its author's own, and his grasp of the general European history of the times with which he deals is, to say the least, as vigorous as that exhibited in the rather disappointing second volume of the *Life and Death of John of Barneveld*. We cannot, however, suppress a wish that Mr. Geddes had not thought it necessary to imitate Mr. Motley—or rather, perhaps, the inimitable old master who is primarily responsible for the fashion to which we refer—in adopting the familiarly picturesque style of historical composition. He more than once gives vent to a regret which we both understand and share, that so little should be known as to the personal life, character, and habits of the chief personage of his narrative, whom he is unable to call his hero. A Boswell or a "chatty" French memoir-writer would, as he freely avows, have been hailed by him as a godsend for enlivening his book. Other writers before Mr. Geddes have made the most of the modest *ménage* of the Grand Pensionary of Holland—consisting of John the man-servant and old Griettin the maid; and we can excuse him for clutching eagerly even at De Witt's pipe and tobacco-box, although the habit might at a venture have been assumed to have been acquired at the University of Leyden, to the threshold of whose lecture-rooms the weed is at this day no stranger. But the theme of Mr. Geddes's narrative, and the way in which he tells it, are quite attractive enough to dispense with the need of tricking it out with the tawdry ornaments of would-be humorous phrases and more or less felicitous nicknames. The *nom de scène* of "Bellicoso" is at all events intended as the equivalent of the native sobriquet of Vice-Admiral de With, a personage sufficiently striking in himself; for he was on the one hand as fearless a commander as any that the Dutch navy boasted, and on the other so far from popular that the sailors "would more cheerfully toss him overboard than obey him." The constant introduction of "that rogue Musch" after this facetious fashion is less pardonably tedious; and the most impatient critic of the proceedings of the States-General must grow weary of finding them ironically paraphrased as the "intelligent," or "enlightened," or "educated mediocrities." After all, if a comical effect be desired, it is most liberally supplied by the official style of their High Mightinesses themselves, and, indeed, by the epistolary courtesies of the Dutch society of the age in general. Here, for instance, is a fragment of a letter, hardly to be termed "familiar," in which a sister, while according to custom addressing her brother as "Your Nobleness," requests him to say to "Miss Kletscher," with reference to a French maid recommended by her—

> that I fear the girl is somewhat over-hasty in the head for me, thanking her nobleness for the trouble she has taken, and requesting that, if her nobleness falls in with another, she will be pleased to let your nobleness at once know, in order that your nobleness may inform me by a note.

We are, however, so thoroughly convinced that a healthy reaction in the taste of English readers of history will before long sweep away the affectations of which we complain, that we think it unnecessary to dwell further on the peculiarities of Mr. Geddes's style. It is only on occasion that he indulges in Carlylese, and when he does so, he is so painfully like his model that the effort is too severe to last. The following, for instance, reminds us of nothing so much as of those famous bits of Cambridge Greek prose the only fault in which lay in their being just a shade too Thucydidean to have been written by Thucydides:—

> Hollanders and Zealanders had suffered severely from the English depredations, and this new stadholderless government lay listlessly doing nothing. Their sea-king, Tromp; why not let him, invincible yet, loose upon these English? "What, have we no government, then? Give us our captain-general, as of old."

Turning, as we very readily do, from the form to the substance of this volume, we need hardly observe that in both biographical and general historical interest it cannot fail to be surpassed by its successor or successors. John de Witt was still a young man—only thirty years of age—when in July 1653 he was sworn in to the highest office in the most powerful of the United Provinces. For five months previously he had provisionally held this post of Councillor-Pensionary, "or, as he is called in England, Grand Pensionary," of Holland, the youthful successor of such aged servants of the State as Adrian Pauw, Lord of Heemsteede, and the venerable Father Cats. Before this, De Witt had for about two years been Pensionary of his native city of Dort, to whose virtually hereditary oligarchy his family belonged; and as such he represented the town in the States of Holland when assembled at the Hague; or, more strictly speaking, it was his duty "to accompany the town's deputies to the meetings of the Provincial States, in order to advise and assist the deputies and conduct their business. In the Provincial States he collected the opinions of his group, expressed its views, and announced its vote." It was the privilege of Dort, which that town owed to its antiquity, for its

* *History of the Administration of John de Witt, Grand Pensionary of Holland.* By James Geddes. Vol. I. 1623–1654. London: C. Kegan Paul & Co. 1879.

delegates to vote first in the States of Holland; while its Pensionary acted *ex officio* as the substitute of the Grand Pensionary of the province in the case of his absence. Thus birth and merit combined to place De Witt early at the head of affairs; and he seems to have exercised a commanding influence upon them since the beginning of the year 1652, when he managed the business of a Committee on English affairs, appointed by Holland, in its usual high-handed manner, on its own account. In other words, the volume before us contains the narrative of not more than two years of De Witt's visible statesmanship; and though these include transactions of extreme importance, and at least one State paper of signal interest, De Witt's justification of his own conduct with reference to the *Acte van Seclusie*, still a more abundant harvest of personal monuments of his political activity may be looked for in the account of his tenure of power during the eventful eighteen years which followed. Mr. Geddes, it is true, has judiciously warned us that the man himself is likely to remain in a great measure hidden from our view; but his principles as well as his practice as a politician cannot but reveal themselves more clearly in the light of the events which succeeded the fortunate audacities and trickeries of the spring and summer of the year 1654. We shall be interested to see what share Mr. Geddes attributes to John de Witt in the publication entitled *Holland's Interest*, written by Peter de la Court not long after the loss of Brazil by the Dutch, but which to a brilliant essayist has suggested "John de Witt, looking over the shoulders of his friend the author, and murmuring his daily evensong, 'De furore monarcharum libera nos Domino!'" The continuation of Mr. Geddes's *History*, before it reaches the catastrophe of the De Witts, the tragic accompaniment of the heroic resistance offered by Holland under William of Orange to the assault of two powerful monarchies, will have to give the whole story of the designs of France against the Netherlands, as well as that of the Second Anglo-Dutch War and the Triple Alliance, in which John de Witt achieved his greatest successes as a national politician. To this later period likewise belongs the completion, in so far as it can ever be said to have been completed, of the political system of which De Witt was the lifelong champion, by means of the Perpetual Edict and the Act of Harmony of the year 1667.

Already, however, in the first instalment of his work Mr. Geddes has found occasion for much valuable research, and for comments which are certainly not deficient in decisiveness. We cannot here do more than refer to the remarkably lucid introductory section entitled "De Witt's Political Environment," in which the three chief aspects of Dutch politics in the middle of the seventeenth century are sketched with a vigorous hand. The first subdivision of this section deals with the Peace of Münster and the negotiations during which, "as Aitzema puts it, the Republic laboured as if in travail in ushering the Peace into the world." The conclusion of the Peace was a triumph of the oligarchy of Holland over the views of the House of Orange upheld by faithful Zealand, and over the policy of the French alliance; and it opens, as Mr. Geddes shows, a period in which De Witt, and William III., and Marlborough were to carry the new principle of statesmanship to its logical consequences. Instead of war *in perpetuum* in alliance with France against Spain, the establishment of a barrier of Spanish territory against France had now been recognized as the basis of a true Dutch policy; and from establishing a barrier to defending it, the step was an inevitable one. From the question of the Peace of Münster and its significance for the Netherlands, Mr. Geddes passes to a consideration of their attitude towards England, and thence to a brief but very perspicuous delineation of the nature of the Union, and an account of the struggle between Holland and "the Prince," the ardent and ambitious William II., whose second and most dangerous tyrannical design, the secret offensive treaty with Mazarin, was only rendered futile by the sudden hand of death. Against his previous violation of the constitution in the matter of the state of war, which had culminated in the attempt upon Amsterdam, Dort had set the example of resistance; and Jacob de Witt, the father of the future Grand Pensionary, was one of the six patriots whose imprisonment at Loevesteyn gave rise to the contemptuous term applied by the partisans of the House of Orange to their opponents as the "Loevesteyn faction."

For English readers this volume is likely to possess a unique interest, centring in its narrative of what may assuredly be termed the strangest diplomatic negotiation into which this country has ever entered with a foreign Power. We do not know whither else to turn for so plain and succinct an account as that furnished in Mr. Geddes's pages of the great Protestant and Republican scheme of an Anglo-Dutch coalition. Though other projects of alliances have been more long-lived than this, yet it formed part of one of the grandest political conceptions which have ever entered the brain of a practical statesman; and (which is perhaps strangest of all) it both preceded and followed the passing of an English law intended to destroy the maritime trade of the Dutch and the waging of a war which had threatened to ruin Amsterdam, "the emporium and sovereign city of the world's commerce." Oliver Cromwell, of whose "great form" De Witt had, in the opinion of his biographer, "by no means taken the measure," in no transaction of his life exhibited a more striking combination of visionary grandeur of aim with politic readiness to drop what was practically beyond his reach. Nevertheless it must be allowed that the projected union of the two Republics had been imperfectly "thought out" on the English side, and that the pettier notions of the Dutch had at least the advantage of having a more substantial basis. There is considerable vagueness in the view attributed to Cromwell by an intermediary that "both parties would require to think of means which would contribute to the firm and friendly alliance of the two Powers," and there is some reason to doubt whether he was right in surmising "that the security might be found in admitting into the Government of each country two or three representatives from the other; the English representatives to have seats in the States-General or in the Dutch Council of State, and the Dutch representatives to have seats in the English Council of State." At the same time, Cromwell adhered with the utmost tenacity to the demand which he perceived to be one of immediate urgency—that the Prince of Orange should be excluded from office. He showed much flexibility with regard to the question as to how this was to be done, thus using his best endeavours to facilitate De Witt's difficult task; but from the demand itself he never swerved. De Witt's diplomatic skill and audacity, on the other hand, entitle him to the highest admiration which can be given to the unscrupulous pursuit of a clearly conceived purpose. He persuaded Cromwell to accept, in lieu of the public article in the treaty originally proposed, an obligation to exclude the Prince of Orange on the part of the Province of Holland alone, and he thus contrived both to bring about the peace with England which he knew to be indispensable, and to trick Holland into passing the Act which accomplished a primary object of his own policy at home.

It is impossible here to follow Mr. Geddes at length into the speculations with which this volume concludes concerning the general character and result of De Witt's "work," and the possibility which existed for him of following a course different from that which he actually adopted. Ardent democracies established on a broad basis, and heroic individuals or families with an uncontrollable instinct in the direction of monarchy, have, more usually than cumbrously constructed and slowly moving oligarchies, secured for themselves the sympathy of modern historians. Of all Federal systems of which history knows, that of the Union of Utrecht was probably the least compact; and the mutual jealousy of the provinces, more especially that of the smaller against the greatest, placed any revision of its conditions virtually out of the question. In De Witt's days Holland paid more than fifty-eight per cent. of the common expenditure of the Union, and Utrecht rather less than six; yet Utrecht could and did strive to counteract or undo what the action of Holland had accomplished. Still more unworkable was the principle that in every province every town retained its sovereign rights except where these were, with those of the provinces, abridged by the Act of Union, and, together with these rights, a *liberum veto* upon proceedings of the States-General as well as of the Provincial States. Of the difficulties and absurdities of "home rule," as Mr. Geddes calls it, the history of the "United" Netherlands is accordingly full, and fuller than ever in the Stadholderless time which succeeded upon Prince William II.'s transitory *coup d'état*; nor is there anything exceptional in the illustration, belonging to the time of the second Anglo-Dutch war, of the coexistence of "six lieutenant-admirals instead of one, with such a nominal right of supreme command to one of them as the weak States-General could bestow, but had not the faintest vestige of power to enforce." The House of Orange and its friends, both foreign and domestic, including the populace, the bulk of the army, and the Calvinistic clergy, were ready to apply a simple remedy. But, apart from questions of right and law, can it be conceived that a community such as that of the free Netherlands—artificial in the conditions of its political as of its commercial life—could have been carried safely through the complications and dangers of the third quarter of the seventeenth century by the novel experiment of a democratic monarchy, conducted in the first instance by a princely family divided against itself? The Province of Holland was strong enough to assume the primacy which was its due, but neither strong nor self-sacrificing enough to merge its identity in that of the common country—a country the reverse of united, even in its political aims. The policy of De Witt, though a transitory, was therefore a necessary one; and in so far, at least, we may subscribe to the following remarks of Mr. Geddes, which we cite in conclusion as an example of his style when on a level with the general excellence of his treatment of his theme:—

> We cannot blame De Witt because he could not get rid of these facts, but he did not desire to get rid of them. On the contrary, he seized and gave stability to their worst characteristics, and made the isolation everywhere deeper and wider. His work tended to perpetuate the evil. But we are bound to consider whether any other course was open to him. There seem to us to have been only two ways of making a nation out of that congeries of provincial and municipal atoms: either to raise the Prince of Orange to supreme power, or to begin to lay the foundations of a homogeneous democratic republic, led by Holland as the most powerful, the most enterprising and energetic, and the wealthiest State. But could he enthrone, in his political creed, a disloyal House, whose two last representatives, for self-aggrandizing ends, would have led the little Republic into strange courses? Of a homogeneous democratic Republic he had no conception; and, if he had, could he have enthroned the ignorant and Orange-worshipping populace, whose fitness for political supremacy was still a long way off, and who would have instantly raised the dreaded House to power with shouts of loud acclaim? There was thus no theory of government left him but government by his own order, the oligarchy; and its ... was municipal privilege and corporate home rule. Its chief merit in De Witt's hands was that it secured for a time the predominance of Holland, and gave to the United Provinces, as Minister and leader, the greatest Dutchman of his time, and one, moreover, on whose public virtue there is hardly a blemish or a spot.

JUNGLE LIFE IN INDIA.*

ON taking up this work we thought that seven hundred pages of jungle life and geology might be too much of one subject. On laying it down after a careful perusal, we may fairly say that we could hardly wish anything omitted. Readers are here introduced to a very different India, as we are told in the preface, from the India of populous cities, mighty Rajas, and splendid monuments that have been described at least a score of times. This is a record of work of a peculiar and scientific kind, carried out in the teeth of great obstacles, manifold privations, and trials of climate. It introduces us to tracts little known except to political officers deputed to put down wicked customs, or to soldiers who have had to penetrate the fastnesses of some rebellious and wayward chief. And the story is told in a simple, straightforward, and unaffected style. Doubtless there is a tinge of sameness in all the experiences and adventures, and certain remarkable sites and ranges are visited twice, three, and even four times over. But the author acted judiciously in publishing his diary with only few alterations, instead of attempting to weave scattered incidents and disjointed visits into one connected whole. Mr. Ball has been employed for more than fourteen years, under the Government of India, in surveying regions which have enjoyed a vague reputation for mineral wealth, such as coal, copper, lead, gold, and diamonds, and he has taken copious notes of their main geological features. In the course of his wanderings he has become familiar with those settled districts of Western Bengal where red sandstone, undulating scenery, and clear streams are a positive relief to Anglo-Indians tired with the oppressive sameness of interminable rice-fields alternating with villages buried deep in bamboos and palms. He went all over a province known as "Non-regulation," and comprised in the South-West Frontier Agency. He visited Orissa, and ascended the Mahanuddi to the outlying post of Sambhulpore. He penetrated to such recondite and feverish places as Kalahundi, Bustar, and Jaipur, which must not be confounded with the principality of the same name in Rajputana. Twice he sailed to the Andamans and Nicobars, and added considerably to our knowledge of the zoology of these islands lying in "dark purple spheres of sea." He made the ascent of a mountain in Ganjam known as Mahendragiri, with the view of judging of its fitness for a sanatorium. Four times he got to the top of Parasnath with its Jain temples. He became familiar with Santals and Paharries, with the Rajmahal hills and with the plateau of Sirgooja. He found time to write a chapter on the remarkable series of lakes which form a striking feature of the Himalayas in the neighbourhood of Naini Tál. And in 1874 he made a journey to our Trans-Indus territories, and ascended the Suliman range in company with wild Beloochee horsemen. So, whether he writes as a scientific geologist, or as a genuine sportsman indifferent to large bags, or as a pioneer and explorer amongst non-Aryan savages, he has a great deal to tell us which will be new to most readers, and which even experienced district officers and Commissioners ought to be glad to know.

Mr. Ball had a regular plan of operations, and it was as follows. Tent life and jungle exploration being the enjoyable incidents of the Indian cold season, the author generally left Calcutta early in November with a fairly defined plan for his geological campaign, and marched with tents, making investigations into basaltic trap, shales, sandstone, coal-measures, mudstones, laterite, and so forth, on his march; and occasionally he rested for a few days at spots of more than ordinary interest. He had, of course, a retinue of native servants with bullock-carts and elephants. But his wanderings extended far beyond the compass of a magistrate's cold-weather tour, both as regards time and distance. Practically he was out in camp during the whole of the hot weather, felt the hot winds, and now and then came in for a few "north-westers," and for a foretaste of the rains. Exposed as he was to considerable variations of temperature, to the chill of an elevated plateau, to the radiation of rocks in a narrow valley, or to intense heat under canvas, he was repeatedly struck down by fever and ague. Fortunately, he seems to have escaped the disease known as regular jungle fever. He had further to endure innumerable privations and hardships, as well as divers petty annoyances. His servants fell ill, or, if they kept their health, were guilty of acts of insubordination. His commissariat was restricted. His postal arrangements were defective and irregular, and sometimes ceased to act at all. Occasionally he was without letters and papers for weeks and even months, and was then overwhelmed with a file of seventy issues, or with official requests that had long ago answered themselves. His horse fell dead lame and he had to perform his journeys on foot. Prolonged marching told upon the endurance of his elephants, and their rate of speed dropped from four miles an hour to one and a half. Occasionally one of these animals, as every sportsman knows to his discomposure, would break its chains at night, wander into the jungle, and give infinite trouble before it could be recaptured. To the heat and the chances of fever, and to the crosses and losses of Indian travel, from which no one except perhaps a Viceroy or a Lieutenant-Governor can claim exemption, were added those which arose out of Mr. Ball's peculiar position. A magistrate within his district, and a Commissioner within his division, meet with obsequiousness and attention wherever they go. Rajas send baskets of fruits and flowers, and reserve for them the best beats on their well-known preserves. Native shikarrees disclose to them alone the haunts of the tiger and the pastures of the *sambur* and the *gaur*. But Mr. Ball was not a magistrate, and wielded no executive authority at all. It is true that Commissioners and other magnates issued circulars about his coming, and warned Zemindars, their agents, and the head men of villages, to show him respect and civility and to furnish his camp with supplies. But every Anglo-Indian knows that there are hosts of underlings who are quite ready to keep the letter of such orders and defy their spirit, and who are delighted at the bare chance of showing to any gentleman of undefined position just as much insolence as they think is safe. Mr. Ball's mission was neither to exact the dues of the State, nor to protect ryots from tyranny, nor to assure Rajas that they would be supported by the Government if they behaved themselves. And we are not surprised to hear that natives now and then regarded him as a harmless lunatic, when they saw him chipping stones, hunting for coal, asking suspicious questions about gold-washing and diamonds, climbing scarped rocks in the heat of the day, and persisting in visiting lonely places which popular fancy had peopled with ghosts and demons. There were, of course, varieties of these jungly Zemindars. While some underbred specimens chewed *pun*, and smoked and spat, and asked impertinent questions, others were glad to befriend this wandering Englishman. Raja Bindeshuri Sing, the ruler of Sirgooja, was a favourable type of his class; and specimens of his conversation show point, refinement, and tact. This gentleman was very properly in late years made a Companion of the Star of India; but it is significant of the Oriental way of dealing with enemies, that in the Keonjur disturbances of 1868, this same polished Raja, taking the field with us, had no hesitation in cutting off the ears and noses of the mutineers whom he did not either hang or shoot. If his not very well-defined position subjected Mr. Ball to sundry annoyances; if he had to wait here for supplies and there for transport; if, when his camp was robbed, the native inspector of police was lax and exacting by turns; if the Uriya in his native wilds was a very different being from the Uriya bearer of Chowringhi, who is generally faithful and attentive—if, in short, the spirit of the jungly tribes was anything but divine and in some cases was below the level of humanity—yet at the same time the author obtained glimpses of native character and feeling not always disclosed to men who may be more accomplished linguists and fill higher posts. It is fair to state that Mr. Ball was never intimidated or threatened with violence, and that he marched for weeks and months miles away from all civilization, without ever having to use his weapons against anything but birds and beasts. Something of this is due to his cheerful and patient spirit and to his ability to manage natives. Indeed it is impossible to read his journal without feeling that no man who did not possess a fund of self-reliance, a fertility of resources, a command of temper, and a keen observation, could have discovered so much or surmounted so many obstacles.

Readers of different temperaments and pursuits may find plenty of interest in these pages. To the sportsman they will tell something, though this is not a sporting work. To a zoologist the jungles that stretch from the Damudah in a western and south-westerly direction to the Mahanuddi and the Wyngunga offer manifold attractions; and all persons removed from such commissariat as any decent native bazaar affords must rely on the tank and the marsh for the materials of their dinner. Snipe and teal, ducks of various kinds, partridges of more than one sort, jungle fowl, spur fowl, and pea fowl, fell to Mr. Ball's gun on his long marches. And he was repeatedly invited by chiefs and landholders to take up his station on an extemporized platform and enjoy a *hank*, or drive for large game. Somehow these expeditions were often failures, or the results were small compared to the trouble taken and the number of men employed. Possibly the Raja took for himself the best station, and placed his guest where neither deer nor tiger would break; or the beaters made too much or too little noise; or some hitch occurred just at the critical moment. But often we read of a bear, or a deer or two, or a few peafowl as the sum total of an organized hunt; and, to say the truth, repeated failures incline us to think that Mr. Ball is not quite as skilful with the rifle as he is with the hammer. Tigers were often seen but not accounted for; and it was not till the cold season of 1876-7 that he managed to knock over one of these animals with an express bullet. But failures and successes are both truthfully and graphically recorded; and in his visits to the Andamans he floundered through mud and decayed vegetation in tidal creeks and infected jungles in search of strange specimens. His account of the swallows and their edible nests made of seaweed, cemented by a gelatinous substance of dark colour; of the *bêche-de-mer*, or sea-slug; of the crab-plovers; of the megapodes, or mound-builders, and the strange way in which the eggs are hatched by warmth produced by the chemical action of time and decaying vegetation, will interest others besides ornithologists. We observe that in one of these trips the author had the advantage of serving under Mr. A. O. Hume, a well-known zoologist, who at that time was at the head of the department of Revenue and Agriculture expressly created by Lord Mayo. Several other facts may be noted in these pages. Cocoanuts are not indigenous in the Andamans, though they have been introduced and do well at Port Blair; and yet there are forests of these trees on the Nicobars and the Coco Islands. The rhinoceros is not found on the south or right bank of the Ganges near the Rajmahal Hills, though we rather think

* *Jungle Life in India; or, the Journeys and Journals of an Indian Geologist.* By V. Ball, M.A., Geological Survey of India, Fellow of the Calcutta University and of the Geological Societies of London and Ireland. London: De La Rue & Co. 1880.

this animal was known there a quarter of a century ago. No grey partridges were seen in a long march from Jaipur in the south to Chateesgurh in the Central Provinces, and the shrill cry of this species can easily be distinguished from that of any other. And only one specimen of the floriken was obtained in Chutia Nagpore, though the bird is common in the huge plains on both banks of the Ganges, especially in the districts of Dinagepore and Rungpore. Of larger game there was occasionally no lack, in spite of the efforts of Sontals and others to keep these animals for their own special amusement and support.

We have not forgotten that geology was the chief object of all these expeditions, and Mr. Ball in one of his appendices gives a list of the various learned papers which he has at times contributed to the records of the Geological Survey or to the Asiatic Society regarding fauna and flora, and the coal and copper fields which he so patiently surveyed. To these sources we must refer all who wish to start Companies or to add to their own scientific knowledge. But we think it most desirable to draw attention to certain passages where the author condenses his own experience, and warns speculators of difficulties and obstacles. Very often anticipations of rich and inexhaustible seams of metal have turned out to be wholly delusive. Sometimes the veins are thin or are disturbed by "faults." When found at no great depth from the surface, they are speedily worked out. In one notable instance great expectations were formed by the discovery of coal in the Suliman range, but the seams were thin and not worth working, and the author finds it imperative to negative all hopes of vast abundance of coal in that quarter. A seam of coal, we are pointedly told, must not be taken to mean a "coal cliff." Then, even supposing we have the luck to light on a tract full of mineral resources, the success of mining adventure is affected by a variety of other considerations. Transport is expensive and communications are uncertain. Native agents will not take to geology and can never be wholly trusted, and Englishmen fall sick and die in jungly places far away from medical advice. Mining rights are mixed up with the land tenures, and native proprietors drive hard bargains, or involve Companies and their managers in heartbreaking and ruinous litigation. Sometimes the ground has been already occupied, and we find mention of Rajas who sub-let the rights to gold washings, and of natives who have smelted iron ore for years after a rude and unscientific fashion. In one passage Mr. Ball rather adopts the views of the non-official community, and inclines to think that the official class, or some members of it, dislike the sturdy and independent Englishman and still regard him as "an interloper." To this it might probably be replied with much truth that this same independent and vigorous Englishman is apt to override native rights and feelings altogether, and that the magistrate can only be said to dislike "interlopers" when he interferes to see that the natives have fair play. Moreover, it is well known and might be within Mr. Ball's own experience, that English Companies have been wound up simply because they went to work with too little capital, or with insufficient knowledge of the locality, or because they had rash and inexperienced managers, or because labour was too high in price, and the article produced did not sell. For a long time coal has been produced in the Ranigunge coal-field which does not suit sea-going steamers at all, and gives out far less heat and light than English or Australian coal. Government would hardly employ such qualified agents as Mr. Ball to report on the mineral resources of India unless they were really anxious to promote healthy private enterprise; and any exceptional jealousy shown by the official to the non-official class is certain eventually to disappear with the extension of railways and the spread of commercial venture, and with a wider and sounder knowledge of those elements of failure and success which must be taken into account in all such enterprises, from Canada clearances and ostrich-farming at the Cape, to coffee estates in Ceylon or tea-gardens in Assam and Darjeeling.

Many of Mr. Ball's descriptions of the scenery of Chutia Nagpore and of adjacent native principalities are attractive. He was not ordinarily employed in the magnificent ranges of the Himalayas; nor, again, was he confined to the arid plains of Hindustan and Behar. Some of his illustrations give us glimpses of considerable natural beauty, and no tour could ever be uninteresting which took the traveller through rocks and glades, by clear streams and under lofty peaks, and afforded him views over a wide tract of country in which patches of cultivation stand out in contrast to primeval forests. Then it must not be forgotten that in all these trips Mr. Ball was his own master. He pitched and struck his tents when and where he liked. He had only to take care to accumulate sufficient raw material to work up into a goodly report during the inactive hot season. He was never diverted from a cherished plan by any request from a tiresome Commissioner to know why he had failed to rout out a nest of *budmashes* (bad characters) at the other end of his district, or by an urgent demand from the Board of Revenue that he should march in a totally different direction to conclude a settlement of revenue with some impracticable *Puttidars*. A vast territory was open before him, and he could go from north to south and from east to west as it suited him. This freedom of action must have compensated for many privations, for the impertinence of ill-bred agents and the neglect of sluggish inspectors of police. We may notice one or two points where Mr. Ball's knowledge of native terms appears rather defective. The phrase *running a muck* is not derived from the Arabic word *ahmak* or foolish, but we think comes straight from the Malay "*amok*." And when he names a functionary as Nigoman or revenue collector, he means, we apprehend, only the Persian word *Nigah-bán*, a keeper or custodian. Again, when, at page 477, he describes a threshing-floor as made by the Hos Kols of mud or clay, smoothed down and baked by the sun, as well as the process of treading out the grain by the unmuzzled oxen, he does not seem to be aware that he is describing what he might have witnessed in any Bengali village within a few miles of Calcutta. But whether we judge the book by the varied scenery traversed, or by the odd sights witnessed, or by the description of the native as he appeared in his undress without varnish or veneer, or by the general style of the narrative, we can recommend this volume as picturesque, new, and original, and can fairly say that, if the life of a pioneer in the jungles is ever to be brought home to the untravelled Englishman, it can only be by such journals, which are worth a bookshelf of flimsy sketches and of flying tours.

MUIRHEAD'S GAIUS AND ULPIAN.*

MUCH has been done of late years to remove from these kingdoms the reproach of neglecting the study of Roman law; and the present edition of Gaius and Ulpian is to be welcomed as an important contribution to that end. The specific occasion of it is the new collation of the unique Verona MS. of Gaius by Studemund, the results of which have occupied Continental scholars for the last few years, and are now for the first time brought before English readers. Professor Muirhead's edition, however, has quite enough merits of its own to stand on without this element of new matter, though the new matter is of importance. It is a thoroughly careful and scholarly work, aiming at the right sort of ends, and successfully accomplishing them. The editor has not been led away by any temptation either to lower his book to the level of a mere manual for examinations, or to treat Gaius as a peg whereon to hang discursive essays in general jurisprudence. He has taken in its full and simple sense the duty of editing a classical text of Roman law, and has performed it with constant diligence and with judgment seldom at fault. The translation subjoined to the text is made as close as practicable, and many technical terms are either retained in the Latin form or given in English forms which are transcripts rather than translations. In this we think Professor Muirhead quite right; it is a case in which the fear of uncouthness should not be allowed to outweigh the need of accuracy. The terms of Roman law cannot all be fitted with English or Scottish equivalents, and even where it seems possible there is danger of confusing the reader's ideas. So far as modern technical terms have been employed, Professor Muirhead has naturally preferred those of Scots law to the English ones where they differ; and this may be found a little perplexing at first by English students using the book, but the inconvenience is one which the use itself will soon remedy. A new and material feature of the book is the "Alphabetical Digest of the matters contained in the text and notes, and of service as an index." This occupies nearly two hundred pages, and in fact amounts to a concise exegetical and critical dictionary of so much of the Roman law as is to be learnt from Gaius and Ulpian. Great clearness and concentration are gained by this method, as may be seen by turning to any of the important articles, such as *Caput*, *Hereditas*, *Testament*. Altogether the student equipped with Professor Muirhead's edition may go forward with the confidence of the soldier who knows that he is armed with a weapon at least equal to anything yet produced.

At this time of day it is needless to say much of the scientific and historical value of that which remains to us of the Roman law treatises of the classical period in their original form. Besides their primary importance for the knowledge of Roman law itself, comparative jurisprudence and the comparative history of institutions could without them hardly exist, or would at best be far more conjectural than they are. Several indications of great interest—fewer, unhappily, than could be wished—are given in passing allusions to usages and ideas already obsolete in the writer's time. Thus we find noted in Gaius the anxiety of the men of old time that an heir should not be long wanting, "ut esset qui sacra faceret," showing the importance in old Roman life of the family ritual which to this day plays a conspicuous part in the Hindú law of succession, and helping us to trace back the origin of the quasi-religious view of inheritance to the far past of [illegible] undivided Aryan stock. So, too, when we read of [illegible] class of descendants called *sui heredes* that they are in a manner owners of the inheritance even in the ancestor's lifetime—"vivo quoque parente quodammodo domini existimantur"—we cannot but recognize a surviving analogy to the Joint Family of Hindú law. Again, the remark that in old times the spoil taken from an enemy was deemed eminently and peculiarly a man's own—"maxime sua esse credebant quæ ex hostibus cepissent"—throws some light on the obscure question of the origin of private property (for so far, at any rate, we have got in the history of institutions as to know that the fact and the idea of property as a separate individual right by no means come by nature in the earliest stages of human culture). And here once more we are struck by a Hindú analogy. Things gained by personal valour are mentioned as among the first recognized

* *The Institutes of Gaius and Rules of Ulpian.* The former from Studemund's Apograph of the Verona Codex. With Translation and Notes, &c. By James Muirhead, Professor of the Civil Law in the University of Edinburgh. Edinburgh: T. and T. Clark. 1880.

kinds of property known as "self-acquired," which may be held as *peculium* (to use a Roman term) by a member of an undivided Joint Family. It is interesting, again, though not quite in the same way, to find in Ulpian that the distinction between authorized and unauthorized religious orders in Roman Catholic countries, and the laws of mortmain established in most civilized nations, have their prototype in the rules of Roman law concerning bequests to temples:—"Deos heredes instituere non possumus præter eos quos senatus consulto constitutionibusve principum instituere concessum est." It would not be difficult to multiply instances to the like effect. Again, we read in Gaius of the *actio furti* that "if clothes have been given to a fuller to be pressed or scoured, or to a tailor to be repaired, and that for a fixed recompense, if he has lost them by theft it is he that has the *actio furti*, and not the owner; for it matters not to the latter whether they be lost or not, seeing he can recover damages from the fuller or tailor, if he be solvent, by an action of location. . . . What has been said of a fuller or tailor applies equally to him to whom we have lent some specific article." This is exactly parallel to the rule of early Teutonic and Anglo-Norman law, traceable in England almost into modern times, that possessory remedies belong to the bailee and not to the bailor; and the same reason is given for it, though it is at least probable that the reason inverts the historical relations. (See Mr. O. W. Holmes, junior's article on "Possession" in *American Law Review* for July 1878.) But we shall now turn to a subject more immediately relevant, if to some readers dry and crabbed—namely, Professor Muirhead's critical and other notes on Gaius.

The materials for reproducing the text of Gaius are far from being all that could be wished. The one MS. on which we have to depend is a palimpsest not in the best condition, the Epistles of Jerome having been written over Gaius by some good man who little thought how ungrateful posterity would be for his labours. Some parts have even been thrice written upon. It is true that the skilled and patient industry of Studemund has recovered the readings of the original in many places where they had escaped his predecessors in the work; but, when all is done, there still remains a sad account of hopeless blanks. And, by a special perversity of fortune, some of the most mutilated passages of Gaius are such as we can least afford to miss, relating to topics of great historical interest, which in Justinian's Institutes were either omitted as obsolete or recast in accordance with the then existing law. Elsewhere it is for the most part not difficult to fill up the general sense at least by the help of parallel passages from Justinian, the Digest, or other relics of the earlier jurisprudence. But, even where we have got the certain readings of the Verona MS., there is often a considerable field for the learning and ingenuity of editors. For the MS. text itself is none of the best. It is described by Krüger and Studemund, in their recent smaller edition of Gaius, as abounding in the following kinds of error, apart from obvious clerical blunders. Abbreviations in the MS. from which it was copied appear to have been misread; marginal glosses have been copied into the text; words and whole sentences have been omitted, from the scribe's eye being deceived by the similarity of their endings to those of some preceding word or clause. Altogether the critical work to be done is of no common difficulty, and the difficulty is increased by the nature of the subject; for scholarship and palæography must be joined with an accurate historical knowledge of Roman law to effect any probable reconstruction in corrupt places. Excellent progress has already been made by Continental scholars armed with Studemund's new collation. In Germany Studemund and Krüger have published a reformed text to which Mommsen has contributed his criticism, and the veteran Huschke has recast his well-known edition. In Holland Polenaar has produced a somewhat daring recension, and Goudsmit of Leyden (already more or less known to English students by a translation of his Pandects which appeared some years ago) has given us some acceptable emendations in a critical essay.

But, having the harvests of all these labourers before him, Professor Muirhead has not failed to find something more for his own hand to do. For example, in the Second Book of Gaius, § 135*a*, we read:—"In potestate patris non sunt qui cum eo civitate Romana donati sunt, nec in accipienda civitate Romana pater petiit *a principe* ut eos in potestate haberet." The words *a principe* are Professor Muirhead's interpretation of the MS. abbreviation *ap*, which seems better than Huschke's *aut post* (inserting *statim* immediately before on a doubtful interpretation of the MS.) In iii. § 146, there occurs a sentence which Professor Muirhead has rightly seen to be unsatisfactory, though we shall suggest a different remedy. The question is of the case where a band of gladiators is let out on the terms of, say, 20 denarii being paid for the use of each who comes back sound, and 1,000 for every one killed or disabled. Is the contract one of sale or of hiring? The answer is that it is partly one and partly the other: "Magis placuit eorum qui integri exierint locationem et conductionem contractam videri, at eorum qui occisi aut debilitati sunt emptionem et venditionem esse; idque ex accidentibus apparet, *tamquam sub condicione facta cuiusque venditione an locatione*" (venditionem an locationem, MS.) As Professor Muirhead notes, the sense must be that "two conditional contracts were entered into as regards each of the gladiators, one of sale, the other of location; the event was to determine which became operative." He suggests as an improvement . . . . et venditione et locatione [utrum emptio et venditio contracta sit an locatio et conductio]. Certainly something is wrong, for the "venditione *an* locatione" of the text is not Latin as it stands. But it is easier to read *aut* for *an*, a very slight change, when the clause will read thus:—"and this appears from the event, as if in the case of each gladiator there had been a conditional contract of sale or hiring in the alternative." One might also read *apparere* for *apparet* (as Huschke has already done, finding sufficient reason, it would seem, in the greater elegance of continuing the reference to the foregoing *magis placuit*), substitute *itaque* for *idque*, and read "factum cuiusque venditionem an locationem"; translating, "And (it has been held) that thus, according to the event, the contract made as it were conditionally concerning each gladiator turns out a sale or a hiring, as the case may be." The construction is condensed and something harsh, but the departure from the MS. is hardly wider than in the other reading proposed, and the difficulty of the clause would increase the chance of corruption; and we are rather inclined to submit this as the more probable emendation of the two.

Professor Muirhead's criticism is on occasion conservative as well as constructive; once or twice, indeed, he resists changes which appear to us not only justified but necessary. Thus in Gai. iii. § 201, "interdum alienas res occupare et usucapere concessum est, nec creditur furtum fieri, veluti res hereditarias quarum heres non est nactus possessionem, nisi necessarius heres *esset*" (so MS.), Professor Muirhead "fails to see why" the German editors write *extet*. Surely *esset* is in that sentence a wrong tense which Gaius could not possibly have used. We have heard, it is true, of late English expounders of Roman law who have assumed that the classical jurists could not write Latin and are not to be construed by the ordinary rules of Latin grammar. But Professor Muirhead will at least agree with us that this opinion is to be rejected. We must likewise differ from him on a point of Latinity in his note on Gai. iii. § 189, where he calls *animadvertere* "so feeble a word" for capital punishment that Gaius cannot be supposed to have been content with it. The usage is classical and not infrequent. On the other hand, we are quite of Professor Muirhead's mind as to leaving the MS. text in iii. § 212. A direct action lies under the Aquilian law only "si quis corpore suo damnum dederit." Where the injury is not *corpore datum* the remedy is by *utilis actio*. Gaius gives undoubted instances, and proceeds:—"Item si quis alienum servum de ponte aut ripa in flumen proiecerit et is suffocatus fuerit, quamquam hic corpore suo damnum dedisse eo quod proiecerit non difficiliter intellegi potest." This is contrary to the law as stated in Justinian's Institutes, and the German editors alter it into correspondence. Polenaar lets it stand, and so does Professor Muirhead, holding that Gaius here gives, but with dissent, the opinion current in his own time. That Gaius's own opinion should sooner or later have prevailed and been adopted by Justinian's commissioners is natural enough. Professor Muirhead translates the expression of dissent thus:—"Although here it can easily be seen that, by the push given to the slave, the delinquent did the mischief by his direct act." We think this is a shade too strong; it seems to us that Gaius meant by "non difficiliter intellegi potest" rather what an English lawyer means when he says that the contrary of a received opinion is at least arguable; and we should be inclined so to translate the phrase.

Not to leave off in the arid region of textual criticism, we have reserved our last word for one or two historical points. Professor Muirhead says (on Gai. iii. § 134) that "amongst peregrins a *nudum pactum* was creative of action." We are not aware of any authority for this statement in its general and obvious sense, and it would involve some strange consequences. If it were so, the edict of Caracalla would have actually curtailed, instead of extending, the legal capacities and remedies of the *peregrini* who thereby were converted into *cives*. Again, if a *nudum pactum* was held to create an obligation *jure gentium*, how comes there to be no trace of such a doctrine in the Prætorian law? Professor Muirhead's remark is probably intended to be limited by the context where it occurs; but we have failed to discover what the limitation is, or what known doctrine of Roman law is referred to. On the formula "Fidepromittis? fidepromitto" there is an interesting note, pointing out how in the Republican times breach of faith (*fidem fallere*) was a grave social offence, even where there was no legal obligation, so that a very imperfect law of contracts was found less insufficient in practice than might have been expected. Somewhat in the same way the English law of contract was supplemented in its rudimentary stage, which lasted into the sixteenth century, by the jurisdiction of the spiritual courts to entertain, as matters of conscience, suits *pro læsione fidei*.

MOTHS.*

"SINCE the time of Addison," Lord Macaulay writes, "the open violation of decency has always been considered among us as the mark of a fool." It is not far short of forty years since this was written, and we greatly doubt whether it could with equal justice be said of the present time. We often wonder how it comes to pass that, if a feeling of delicacy no longer acts as a restraint in the choice of books for reading, at all events there is no regard for the opinion that may be formed of the understanding of the reader. By the books that a man reads, almost as much as by his friends, it can be seen what kind of man he is. A

* *Moths.* A Novel. By Ouida. 3 vols. London: Chatto & Windus, 1880.

woman whose taste was so depraved as to find pleasure in reading some of the stories that women are now writing, would, we should have hoped, at all events have hidden herself away while she enjoyed her favourite author. No less ought a man to keep concealed from his fellow-men the emptiness of mind and the poverty of understanding which could lead him to waste his time on the silly writings of this new race of female authors. "Show me," might very properly be said, "a reader of"—and here three or four novelists might be named—"and I will show you a fool." The readers to whom Addison gave so wholesome a lesson had at all events one excuse. Vicious and heartless though their favourite authors were, they had wit. No amount of salt could keep them sweet, but salt there was in abundance. It was wit and virtue, as Macaulay says, that Addison reconciled. But while in a certain school of writers of the present time we have not a little of the indelicacy that disgraced the Restoration, we have not one grain of the wit. There is a kind of spurious imitation of it which bears about as much likeness to the real thing as tinsel does to gold and silver. There is a great swell of words, a tawdriness of language, an affectation of art and sentiment, beneath which is hidden a beggarly poverty of thought. This alone ought at once to disgust any one who was gifted with even a moderate amount of common sense. Such extravagance of writing he ought to look upon as an insult to his understanding. "Does the woman take her readers for a pack of fools," he might very fairly ask, "that she writes for them in a style which a few short years ago would scarcely have been tolerated even in Bedlam?" Readers, however, seem to be found in greater numbers than ever, and folly that would once have been treated with utter contempt is now highly rewarded.

It is always dangerous to attack a book of this kind. What the author asks for is notoriety, and notoriety is gained whenever a criminal is put in the dock. It is needful, however, now and then fairly to put before the world what kind of literature it is that is being sold on our railway-stalls and sent up and down the country by our circulating libraries. We are not of those who hold that, because the class of rich idlers has lately gained largely in numbers and in shamelessness, English society as a whole is corrupt. Scattered throughout the land in all its length and breadth there is happily still to be found that virtuous home life which has done so much to make our country what it is. It is the honourable duty of the critic to guide those who are living such lives as these in their reading, to introduce them to writers of sense and learning and virtue, and to guard them against both fools and profligates. They might perchance, in their innocence, be misled by the titlepage of the novel before us, which they would find adorned with a quotation from the Scriptures. Let them but turn over the leaf, and they will find Scriptures, virtue, and common sense left very far behind. They will be at once introduced to Lady Dolly, "who," they will read, "had everything that can constitute the joys of a woman of her epoch." Why *epoch?* may with good reason be asked. The author either means *time of life*, or *age in which this woman was living*. But neither of those meanings belongs to *epoch*. *Epoch* is defined by Johnson as "the time at which a new computation is begun." Perhaps, after all, some excuse might be made for the word as it is here used. Lady Dolly is living at the present time, and from it the computation might well be begun of the age of silly and vicious female writers. However, we have little doubt that the author thought that *epoch* would better round off the first paragraph of her book than either *age* or *time of life*, and that therefore she chose it, in full confidence that such readers as she is likely to get would like a word none the less because they only partially understood it. In the second page the dress of this lady of the epoch is described. It was "*baptiste* sublimised and apotheosised by niello buttons, old lace, and genius." A few pages further on we come across brown holland sublimated, canonized, and raised to the empyrean. Outside the author's mongrel English there are, of course, no such words to be found as *sublimised* and *apotheosised*, whether by buttons or by anything else. But we must not be too hasty. To her may not belong the honour, or the disgrace, of their invention. She is, we little doubt, a diligent student of her sister novelists—for by what other course of study can she have arrived at the very perfection of a foolish style?—and in a rival's book she may first have come across them. They were too good, and too long, and too unmeaning to be let slip. "'Odours,' 'pregnant,' and 'vouchsafed,'" said Sir Andrew Aguecheek; "I'll get 'em all three ready." Sir Andrew, however, fool though he was, nevertheless got ready words that were in the language. He did not borrow barbarous compounds of ignorance, Latin, and Greek.

For the present, however, we shall pass over the author's language, though no doubt we shall have to return to it again. We shall come to her description of society. Society, we assume, she describes as it is known to her. Perhaps this is all that she could do were she to aim at being true to nature. But then we prefer that those who only know a certain kind of society should at all events have the decency to hold their tongues.

> The chatter of the world [she writes] has almost always an element of the amusing in it, because it ruins so many characters, and gossips and chuckles so merrily and so lightly over infamy, incest, or anything else that it thinks only fun, and deals with such impudent personalities.

In another passage the author writes:—

> Those who are little children now will have little left to learn when they reach womanhood. The little children that are about us at afternoon tea and at lawn tennis, that are petted by house-parties and romped with at pigeon-shooting, will have little left to discover. They are miniature women already; they know the meaning of many a dubious phrase; they know the relative value of social positions; they know much of the science of flirtation which society has substituted for passion; they understand very thoroughly the shades of intimacy, the suggestions of a smile, the degrees of hot and cold, that may be marked by a bow or emphasized with a good-day. All the subtle science of society is learned by them instinctively and unconsciously, as they learn French and German from their maids. When they are women they will at least never have Eve's excuse for sin; they will know everything that any tempter could tell them.

When the author thus utters her shameless slanders against the little children who all around us are growing up to womanhood; when she says that the chatter of the world has in it an element of the amusing because it ruins characters and chuckles merrily over infamy and incest, we turn round upon her, and ask her what is the world in which she lives, and to what class of infamy belong the mothers that she knows whose little daughters are being reared in a steady course of vice? We are reminded how, when Johnson was once told that a miserable wretch who had fled the country had long been a suspected man, he answered, "By those who look close to the ground dirt will be seen. I hope I see things from a greater distance." It is indeed astonishing that any women could be found, except the most abandoned, to read this gross libeller of her sex. What indignation ought to be raised in any woman of common decency, or any man who is not ashamed of his own mother, on reading such a passage as the following:—"She had a gown cut *en cœur*, which was as indecent as the heart of woman could desire." Not the heart of some one of the infamous women who crowd these pages, but the heart of woman—woman whom it has been the aim of a long line of writers to surround and defend with thoughts of chivalry and purity, and whom now a base herd of female novelists are trying to drag down to the level of their own coarse imaginations. The whole plot of this story is an abomination in itself. We might indeed despair of society were we to believe that a woman's tale of incest would not be treated with the contempt and disgust that it deserves. It is she, and not the world, who chuckles so merrily and so lightly over this horrible subject. It is she who spreads it out and dwells upon it in three long volumes. It is she who adds to it the utmost aggravation. And then she attacks "the woman of modern society," who is, she says, "too often at once the feeblest and the foulest outcome of a false civilization." She attacks the world, "which always greets with a damnable smile the approach of a foul idea." She is shocked at "the inane cruel chirping laughter of society when it smells a sin." She writes that "society chirped and babbled merrily of all the filth that satirists scarce dare do more than hint at lest they fall under the law." What right has she to take the shameless profligates of one small class and to call them the world and society? There may be a society which babbles merrily of filth, there may be a world which chuckles over infamy and incest. But we will not allow either those who live in this shameless society and form part of this infamous world, or those who pretend to be familiar with it, to put forward the impudent claim that they are society and they are the world. It would indeed have been a great misfortune had the author of this story been really a clever writer. She is very pretentious; but he must be a poor blockhead indeed who cannot discover that she is very silly. She greatly affects knowledge. She has the names of a certain number of classical authors on her tongue. She writes of the vice which "it is the fashion to pretend to believe shut up between the pages of Suetonius and Livy." She can excite the admiration of her readers by speaking familiarly of "the divine caduceus" and "the thronged auditorium." She makes a waiting-maid sit down by the seashore on a nice smooth stone, which the next moment is called "a madreporic throne." She represents a great duchess when going out shooting as carrying "her own chokebore by Purdy." She calls sea-shingle "the disordered detritus of the beach." She says that a great singer was famous "from Neva to Tagus, from Danube to Seine." She makes the hero pick the rare *Wolfinia Carinthiana*. She describes moths as "burning themselves in feverish frailty." She brings in French with wonderful facility. Perhaps, however, we might object to an excess of accentuation in such a phrase as the following—"qui donc à (*sic*) voulu me mystifier?" Her studies, it will be seen, have been extensive, if not accurate. They have not, however, kept her from writing rant, and from filling her books with folly. Rant, however, might be forgiven, and folly might be laughed at. But there is much in this ignorant, dull, and disgusting story which no person whose mind is not utterly corrupt can either forgive or make a subject of laughter.

RECENT SCIENCE PRIMERS.*

ALTHOUGH no royal road to knowledge has yet been discovered, it is not to be denied that much has been done to shorten and make smooth the path by which the tiro has to make his way to the temple of science or to the stores of

learning heaped up by the literary industry of the past. Not only have conspicuous strides been effected in the method of teaching, but still more striking improvements, it may be thought, are to be seen in the elementary works or manuals which are put into the hands of the beginner. Instead of its being taken for granted that anything was good enough for the first stages of education, and that nothing was easier than to indite handbooks for use in the nursery or the preparatory school, it has come to be realized that to lay aright the foundations of knowledge is amongst the tasks which tax the highest capacity, and give fitting scope for the energy and skill of those best qualified in each department. It is a hopeful sign of educational progress that we see acknowledged masters in many a special branch of science, or in the supreme science of teaching itself, coming forward with handbooks or primers in which the elementary principles of each department of study are laid down with the clearness of consummate knowledge, and with an authority which precludes the fear of the pupil's having later on to retrace his steps. We have had a pleasant task in noticing from time to time more than one series of publications of this kind, in which names of the highest standing in physics, in history, or in classical and general letters, have stood as vouchers for the quality of the teaching, compressed into the minimum of space, and conveyed in terms suited to the beginner. The supply of manuals of this class continues, and we find before us a batch of those most recently issued, which seem well fitted to strengthen the hands of parents and elementary teachers in meeting the intellectual needs of their youthful charges.

Some, indeed, of this series are suited for a more mature class of students, and open up fields of inquiry or information which have hardly, if at all, been hitherto included in the curriculum of education. A strong feeling having grown up of late in favour of embodying in our scheme of education some acquaintance with the industrial condition of the various countries of the world—a kind of knowledge manifestly of very great importance in these days of technical activity—the plan has been conceived of a series of text-books, or primers, setting forth in the simplest language the resources and industries of each country, together with the physical and geographical causes or conditions which have led to their existence. The introductory volume of this series now before us is Mr. Phillips Bevan's *Primer of the Industrial Geography of Great Britain and Ireland*. We here find compressed within little more than a hundred pages a fairly ample and methodical summary of the causes to which our island group, small as it is amongst the states or empires of the earth, owes its high position of wealth and power. This is mainly due, the writer shows, to its geographical position and to the great number and variety of industries which are carried on within so small a space. With her silver streak of sea as a shield from foreign invasion and a channel for her world-wide commerce, she has beneath her soil mineral treasures of vast extent and priceless value. Beginning with coal and iron, Mr. Bevan gives a list of the coal-fields or basins of Great Britain and Ireland, eighteen in number, summarizing the total output of the year as about 150,000,000 tons, giving employment to some half million of colliers and miners. With all regard to economy of space, he might have found room for more definite figures, distinguishing the yield of each separate basin. The want of such tables is, indeed, the one fault we have to find with his work throughout. The sketch of the iron industry, its rise, diffusion, and recent memorable fluctuations, is very clear and full; the different ores are distinguished, with the processes applicable to each; and due notice is taken of the vast development of the steel manufacture, which bids fair to make iron ere long a thing of the past. Copper, brass, tin, and lead fill another chapter, followed by hardware trades, building, glass, and pottery. The textile trades are dealt with under the several heads of (1) cotton and wool; (2) flax, jute, silk, and lace. Agriculture has justice done to it in a single chapter, in which local causes, such as geological formation, varieties of soil, and water supply are shown to determine the diversities of cultivation and the quality and quantity of produce. Food and drink supply items for a short but diversified chapter. Railways and shipping ports bring together ample details of the latest and most widely developed of our industries, the tonnage of shipping, British and foreign, being made to tell anew its marvellous tale of modern progress, the figures having well nigh doubled themselves within the last fourteen years. The useful little manual closes with a "Lesson Table of Industries," giving for each county and each principal town or district the special industry or culture for which it is notable. The series, which we understand is to extend to fifteen volumes, is likely, if carried on throughout on the same plan, to be welcomed as a valuable aid to those engaged in the practical branches of education.

Under the title of *Physical Geography* Mr. Edward W. Lewis has put together an instructive series of facts and theories arranged on the basis of questions set at the Oxford and Cambridge Local Examinations. Without degenerating into the mere cram which we so often find in compilations of this kind, this short compendium enables the pupil to grasp rapidly the leading principles which may be said to underlie and regulate all we know of the existing state of land, sea, and atmosphere, as well as of the physical agencies which have brought about and continue to modify the condition of the earth's crust. Why the author should have fixed almost exclusively upon South America in illustration of the laws which result in the formation of a continent, determining its physical features, the set and volume of its rivers, and other peculiarities of its climate, we fail to perceive, unless it be that the New World may be held to represent in its comparative novelty features of greater attraction to the student. The Nile basin and the Himalaya range are taken as typical illustrations of the effects of river erosion on the one hand, and the laws of mountain elevation and glacial action on the other. From these special instances Mr. Lewis passes on to a more general survey of fluviatile and marine denudation, the growth of coral reefs, the courses of volcanic action and the distribution of eruptive centres, the laws and effects of tidal action and of oceanic currents, with the vertical and lateral circulation of water, particularly in the Atlantic, as affecting the climate of Europe through the medium of the equatorial current, or so-called Gulf Stream. The action of periodical or regular winds is explained, in contrast with that of cyclones or occasional atmospheric disturbances, of which the main phenomena and laws are summarily laid down in their bearing upon practical navigation. What has been done of late towards securing solid ground for a science of weather is made as clear as may well be within limits so narrow. The local circumstances influencing climate, such as altitude, proximity to the sea, ocean currents, the slope of a country, its soil, mountain chains, prevailing wind, and vegetation, are shown to modify the general laws of solar evaporation, condensation, circulation, and consequent pressure. The use of isothermal and isobaric lines in making the results clear to the eye upon a weather chart is explained. In giving in to the popular theory of the connexion of rainfall with sun-spots, which he supports by tables of maximum rain at eleven years' interval, our author, as usual, fails to note whether these figures have been deduced from observations all round the globe (which, in fact, there are as yet no means of determining), or merely from those of a few stations like Madras and the British Isles, which fall in with the hypothesis. Had he had the advantage of seeing the critical discussion of the available meteorological records in Mr. G. M. Whipple's paper lately read before the Royal Society (January 15), he would doubtless have given less definite place to the eleven years' cycle as an element in the determination of such climatic influences.

In *Easy Lessons in Heat*, one of Messrs. Macmillan's excellent series of scientific text-books, Miss C. A. Martineau introduces the beginner to the simple and fundamental problems which lie at the threshold of one of the most progressive and inexhaustible of physical inquiries. The class of readers she has in view are those who, without having the wish or the opportunity to study larger books, are properly curious about what goes on around them every day, who would fain know the how and the why of such familiar matters as the boiling and freezing of water, the draught which goes up a chimney when a fire is lighted, the lighting of that fire, whence the heat comes from which lights it, how it is kept up, and so on. From the simple fact that heat makes most things expand, she proceeds to give elementary notions of the vibratory motion of particles, comparing a heated body to a crowd of people swaying to and fro, and spreading further and still further apart. How heat spreads, first in solids and next in liquids and gases, is illustrated by simple experiments, and the measure of temperature is explained. What is meant by specific heat is made clear, as is the effect of heat in changing solids into liquids and liquids into gases. The anomaly of water expanding after a certain point with cold brings in an excellent chapter upon freezing and crystallization of water, and the phenomena of latent heat, illustrated by woodcuts of snowflakes and flowers of ice, borrowed from Professor Tyndall. From artificial experiments the learner is led on to the infinitely grander operations of nature in geysers and hot springs, in rain and vapour. Wave action and radiation are explained, together with the formation of dew. How heat does work, and what becomes of the heat spent in doing it, brings us to the final lesson that no fact in nature is isolated, but that seemingly small and disconnected truths widen out and link themselves together until they become coextensive with the whole fabric of nature, bearing witness to the unity and continuity of the universe itself. Each chapter of this useful little manual has prefixed to it a list of the simple apparatus needed to exemplify or illustrate the lesson comprised in it. It will greatly encourage the tiro in this branch of physics to see how near at hand are all the experimental aids required for the proof or the verification of each step that his teacher bids him take.

The wide demand for the National Society's Manuals on the Science and Art of Teaching has prompted the issue of a series of works on more advanced subjects, suited to the needs, not only of teachers in elementary schools and students under training, for whom they were primarily intended, but also to those engaged in schools of a higher grade. The preparation of them has been entrusted to writers of distinction in their various departments, who have had large experience as teachers and examiners. What is distinctively aimed at is the training of the teacher in the method of imparting knowledge and disciplining the faculties for the discovery or recognition of truth, as well as forming practical habits in dealing with the economy of life. One of the numbers of this series now before us treats of the teaching of mechanics, starting from the elementary conceptions of matter, its physical states and properties, and the measures of extent, time, and velocity. Next comes energy, or the power to do work, as exhibited by matter in motion and by heat; what is meant by the conservation and transference of energy being exceedingly well set forth. The laws of friction lead to the study of the simple mechanical powers. The principle of liquid pressure is briefly

discussed in theory and practice; as is next the flow of liquids and solids, and the parallelogram of velocities applied both to the path of a projectile and the resultant of multiple forces. A great deal of sound philosophy is here compressed into little more than fifty pages. Two other members of the same series deal with domestic economy; the first (No. 7) relating to dress, dwelling, spending, saving; the second (No. 8) to food, its composition, functions, and preparation. The practice of housekeeping in its widest sense, which is the result here ultimately aimed at, is more than books can pretend to impart. But rules and maxims for the use of persons engaged in practical teaching may be with good effect embodied in print, as the sensible little handbooks before us sufficiently prove. Though bearing no author's name, they are manifestly the work of writers who have added practical experience to theoretical study. With these in hand the young or unpractised teacher may face a class without the uneasy feeling that he is launching, as it were, upon a wide and unknown sea without chart or compass.

THE HONOURABLE ARTILLERY COMPANY.*

CAPTAIN RAIKES has condensed the matter of fourteen thousand pages of Minutes. He has examined many hundreds of manuscript volumes in which are recorded the proceedings of the Courts of Aldermen, Common Council, and Lieutenancy. He has spared no labour, and the publishers have spared no illustrations. The result is a history of which the second and last volume has now appeared, and of which the London Artillerymen may well be proud. The work is bulky; but they should be bound to carry it in their saddle-bags and knapsacks on their periodical marches to meet, as is their privilege, Royal personages at what was once Temple Bar, and to escort Lord Mayors to Westminster Hall. The whole makes a grand chronicle of achievements in purely civic fields. During their occasional banquets, for which their chronicler is careful to inform the public they pay out of their own private purses, one warrior might be detailed to mount the rostrum, and read how the London Artillerymen of old confronted "No Popery" rioters, "Corresponding Society" men, and Chartists, or more dangerous foes in the shape of tyrannical aldermen, and envious Volunteers. But then the work should have been printed for private circulation only. Its interest is too esoteric for the profane understanding of outsiders. No honorary members are ever admitted into the Company. We can feel, as we study these thousand pages, that had we the happiness to see the venerable legion from the inner side we might possibly be as enthusiastic in its praise as is its Musketry Instructor. Gazing and carping from without the sacred walls of its practising-ground we sincerely grieve to be unable in our account of this second volume to recant our verdict on the first. Everything possible has been done by historian, and printer, and heliotypist to set forth the reasons for public gratitude to the most ancient of military corps. Yet the impression upon the outer world must, we fear, be that from the whole circle of human institutions scarcely one could have been more easily spared than the Honourable Artillery Company of London.

But happily there are tastes of all kinds. There may even be minds which will be fascinated by the annals of the Honourable Artillery Company's two centuries and a half of acknowledged existence. For the benefit of any such possible persons we propose to note the chief landmarks of the long and authentic history embraced in this concluding portion of Captain Raikes's work. The volume opens with a dispute between the Company and the Lord Mayor elect, Sir Matthew Blackistone. The Company had refused to attend Sir William on Lord Mayor's Day unless he paid them the customary fee of 50*l.* He offered 30*l.*, with an offer to eke the money out by tickets for the Guildhall Banquet and wine. But the Company refused to eat and drink it out in that way. Eventually it lost all, for King George II. died, and the Mayor was sworn privately at Westminster. In ordinary circumstances there would have been compensation. There was no 50*l.* or Guildhall dinner. But there ought to have been an Address to the new king, and a glorious display of "weepers, queue wigs, and black swords." All was arranged, down to the wording of the Address to "You, Great Sir," King George the Third. The President of the Company himself marred that plan by taking offence about some formality. To the horror of the Company and all loyal Englishmen it seemed doubtful when and how the young Sovereign was to be assured of the devotion of the citizen guardians of his throne. A royal marriage, however, speedily followed a royal accession. That was an auspicious occasion for felicitations, accompanied by a request to His Majesty, "Dread Sir," to nominate in place of the late king a Captain-General over "US," in large capital letters, "who may be a witness that we shall never fail to discharge the trust reposed in us." It is added, with the emphasis befitting the martial contemporaries of Captain John Gilpin, "even to the Risque of our lives." The most important event in the annals is that "at a Court held on the 24th of November the title of Beadle was changed to that of Messenger." We think that rather a pity. Since 1760 the Company had been without a Captain-General. In 1766 the King nominated the Prince of Wales. In honour of His Royal Highness's birthday, a ham and two fillets of veal were ordered to be provided, "to be eat cold in the evening, and two currant tarts four shillings each."

The year 1767 is memorable for a treaty of friendship between two warlike bodies. Lord Mayors, jealous, it would seem, of the independent bearing of the Artillery Company, had sought to sow enmity between it and another redoubtable corps, "the Ancient Body of Cripplegate Grenadiers," whose history is yet to be written. "A body of men who call themselves Cripplegate Grenadiers," as the Artillery Company was wont contumeliously to describe them, had more than once been asked to attend Lord Mayors at Westminster in place of the Artillery Company. We regret to say they succumbed to such a temptation even a few years after 1767. In the latter year, at any rate, they were better advised. The Grenadiers "determined to end such animosities," remembering that they "for many years bore the peake of threatens (*sic*) from" the Artillery Company "from an old grudge of this sort nineteen years ago." The Artillery Company reciprocated the generosity, and the Lord Mayor elect of 1767 had to invite, and probably fee, them both. It may be that the necessity contributed to sour the relations between the Mansion House and Bunhill Fields. Among the entries for the following June we read with dismay that "the Lord Mayor had been treated with great contempt by the Armourer." The Commissioners of Lieutenancy avenged their chief by suspending their annual payment of 150*l.* to the Company. But the Armourer was dismissed and the pension renewed. Among the Company's officials elected in 1770 were two conspicuous politicians. One was Lord Mayor Beckford, the other was Alderman John Wilkes, who was chosen one of the "Generals." It may have been due to the energy of General John Wilkes that the Adjutant discovered shortly afterwards the remarkable fact that "the exercises practised by the Company were quite different to those used by every corps in the kingdom." Thereupon a drill-serjeant was appointed. Lord Mayor Beckford was succeeded in 1771 at the Mansion House by an equal friend of liberty, Lord Mayor Brass Crosby. The Lord Mayor and Mr. Alderman Oliver were committed to the Tower by the House of Commons for their conduct in the constitutional question of the imprisoned printers. The Corporation sympathized with its head, and so did the Artillery Company. When the prorogation opened the Tower doors, the Company "attended in uniform, with twenty-one field-pieces, which were fired when the Lord Mayor and Mr. Alderman Oliver arrived at the gate." In May 1773 "twelve dozen Queen's Ware plates, at three shillings a dozen, were ordered to be purchased"; and in July, four dozen hat pins, with other warlike ammunition. Passing to 1775, we find a long and particular account of the renewal of the Company's lease of its ground, in connexion with the involved and not very creditable negotiations between the City Corporation and the Prebendary of Finsbury about a fresh lease to the former of the prebendal lands. By the amiable disposition of the Corporation, of the Company's Court of Assistants, and of the actual Prebendary of Finsbury, Dr. Christopher Wilson, afterwards Bishop of Bristol, aided by the Parliamentary interest of Lord Rockingham, Dr. Wilson's patron, and of the Corporation, the various financial and legal difficulties were at length surmounted. The only party robbed was the Church. But in those days no one pitied the Church. At least the public, which owes in part to the arrangement Finsbury Park, lost less by the intrigue than by the analogous transaction to which the Southampton branch of the Fitzroy family owes its estates in St. Pancras. As the chairman of the Company's Committee "paid a Benevolence of ten guineas to the Poor-Box, it being customary to make a present on such an occasion," even charity was satisfied.

Secured in the possession of its ground for a new term, the Company became more martial in demeanour than ever. For Lord Mayor's Day in 1777 an order is recorded that the officers are to watch over their men's conduct on that night, "as a considerable share of the future fame of this Company depends on the spirited execution of the guard at Guildhall." The next year, obviously *ex abundanti cautelâ* only, it is decreed that "any member convicted of being disguised in liquor at the Lord Mayor's ball, being in regimentals, shall be fined half a guinea." The next month it was resolved at a Court to beat up for new members, in view of "the general preparations for war then being made throughout Europe," and also of the evidence afforded by "the Charter of Henry VIII. and the Patents of James I. and Charles I., that the Company was in those times deemed useful for the maintenance, defence, and safety of the Realm." Such a spirit is sure of a worthy sphere sooner or later. The Company had to wait for its opportunity a short two years. Wednesday, the 7th of July, 1780, was, says Walpole, "the fatal day" for London. It was a proud day for the London Artillery Company. Lord George Gordon's admirers took possession of the metropolis on that day, and the Artillery Company, if not actually under fire, was behind it. The mob sacked a house in Broad Street; and a contemporary engraving depicts the Company firing on the rioters. The Company's Major is seen in the print, which is reproduced in the present volume, giving the word. His superior rank is denoted by a majestic width of person at least double that of any of his men. On no subsequent occasion did matters come to this extreme of direct collision with an enemy; but the Company was often called out in the years of high political strife which followed, to guard the tranquillity of London streets. An element of prudence was mixed with their bravery. They decided at this period not to print in their lists their residences, as "in times of tumult the

* *History of the Honourable Artillery Company.* By Captain G. A. Raikes. London: Richard Bentley & Son. 1879.

places of abode being known might prove inconvenient." Still, in times before the new police force was enrolled, they probably had their uses. In 1794 they received the thanks of the Lord Mayor for intimidating mobs which were endeavouring to destroy public-houses where recruits were enlisted. They were under arms during the trials of Hardy, Thelwall, and Horne Tooke. In the following year they were at various times called out to protect the City against disturbances supposed to be contemplated by the Corresponding Society, or by Bethnal Green weavers out of work. During elections, moreover, when it was held unconstitutional to keep the Guards at the Bank, the Company took their place. But one of their grandest displays was on the occasion of the great Chartist assemblage in 1848. That occasion must rank in their history second only to the 7th of July, 1780. They had the glory of being instructed as if on the eve of real battle. Their Colonel, "in a short spirit-stirring speech called on them to stand by one another and to fire low, picking off the ringleaders." They could even boast that they had real stones thrown at them. It was not their fault, but their misfortune, that they never had the luck to be under fire of musketry. One of their corps, however, a Mr. Richard Pepys, blew off his own hand in firing a salute to the President, and the Company never forgot it. Mr. Richard Pepys's name is constantly recurring in connexion with favours received. The Company created an office as a pension for him, interested itself to obtain a City post for him, and finally paid him off with a gift of 150*l.*, when he sailed to some appointment in Sierra Leone. Of less splendid experiences than shooting or being shot at there is a sufficient abundance for the latter years of last century. There were field days with the Royal Independent Blue Volunteers of Marylebone in 1783; balloon experiments on the Artillery Ground by Michael Biaggini in the same year and by Vincent Lunardi, "Secretary to the Neapolitan Ambassador," in 1784, when the royal Captain-General was present; and again in 1785 addresses to the King, expressing the loyal Company's "highest gratification" at the removal of the Coalition Ministry, and, somewhat later, the dismissal of Mr. Thomas Lawrence for holding "opinions inimical to the present Government of the country." Among other incidents in the *olla podrida* of the Company's annals, we note the incorporation in 1784 of the present Regent's Park Toxophilite Society as a flank division of Archers; feuds with the farmers of Finsbury Fields on account of the obstructions they raised to the Company's annual march to practise for itself with bows and arrows, according to the usage of the reign of King Henry VIII.; and Orange demonstrations of the Company, which was till 1829 always devoutly Protestant, though it fired on Lord George Gordon's friends. There are even entries of such really military events as inspections, sometimes in association with twelve thousand other Metropolitan Volunteers, when the Company was by general consent ranked as first battalion of the first brigade, under the eyes of the King himself, sometimes alone, when the Assistant Adjutant-General Macquarie "told Mr. Alderman Watson that they were an astonishing corps." Assistant Adjutant-General Macquarie was very probably right.

Not all of the performances we have thus briefly summarized were, as we have intimated, of a strictly military character. But the Company once at least in its career appeared on the point of coming to actual blows with another body of civic warriors. In 1795 the sanctity of the Company's Artillery Ground was threatened. A new-fangled soldiery, called the City Militia, was in that year reorganized, and pretended to represent the Ancient City Trained Bands. The Company's leases had always recognized the right of the City Trained Bands to the use of the Artillery Ground for drilling and exercising. Accordingly, the City Commissioners of Lieutenancy claimed the use of the ground and armoury daily. It was almost adding insult to injury that they expressed their magnanimous readiness to leave it free to the Company itself for part of two days in each week. The Court of Assistants replied by a haughty defiance to demands which, it declared, would end in the virtual annihilation of the glorious Artillery Company. For five years the strife raged, the City authorities being opposed to the Company, which had gradually, like other City Companies, been emancipating itself from identity with the Mansion House and Guildhall. On the 29th of October, 1796, it seemed as if the crisis had arrived. The Company had about doubled its numbers since 1783. Then it counted but two hundred and thirty men, of whom only from sixty to eighty were privates and ten gunners, the rest being officers of various ranks, and thirty-one bandsmen. Still, between four and five hundred made hardly a force to match the City Militia. Yet the commanding officers locked their gates, posted their men and field-pieces in convenient positions, and prepared for victory or death. We wish we had space to narrate the event with all Captain Raikes's solemnity. We can only state, in the briefest way, that the London Militia, with bayonets fixed and drums beating, marched right up to the gates, and then, finding them inhospitably shut, took it so much to heart that they marched back to St. George's Fields. The Company remained in possession of all the honours of victory. Unhappily, courts of law thought the new London Militia corresponded to the old London Trained Bands. After further and vain legal resistance, the Company resigned itself to the ignominy of admitting partners in its parade ground. One Black Monday in May 1800, "all the gates were locked, and at a quarter to eleven the West Regiment of London Militia presented themselves at the Gate in Bunhill Row, and, on declaring who they were, the Committee ordered the Messenger to open the gates, when they marched in." *Sic transit gloria mundi.* However, though the City Militia had got the better of the Company, fortunately for its self-respect City Volunteers sprang up at different times, and tried to emulate the victory of the Militia. Sturdily did the Company hold its ground. Volunteers, whether in the reign of George III., or in that of Queen Victoria, could never violate that holy herbage of the Artillery Ground. Bank of England Volunteers, Royal East India Volunteers, and City Police, looked with ineffectual longing through the wrought-iron gates into a drill ground smoky but unmatched in the metropolis. Their prayers were regularly declined with regrets. No such politeness softened the Company's rejection of a letter in 1873 from the officers of the City Volunteer regiments, in which the Court of Assistants was requested to admit the Volunteers to drill in its ground, as being "the successors of the London Trained Bands." The Court would not consent even to "receive the letter," in consequence of "the most offensive and unwarrantable terms in which it was written." The offensiveness was in the Volunteers' claim to be in the place of the ancient Trained Bands. The Volunteers would have withdrawn that allegation. But the Company refused to be appeased. They declared that the terms of their lease did not even allow them to suffer the Volunteers to drill in their ground for a few hours on Wednesdays and Saturdays.

The Company's success on this occasion in playing the dog in the manger made amends for its defeat seventy-three years before. In the interval, however, it sustained two very considerable reverses, and from its own Captains-General. The year 1840 saw "the commencement of the first great struggle between the civil and military authorities of the Company." King George IV., who had been Captain-General when Prince of Wales, retained the command when King. The frequent changes in uniform which Captain Raikes records during that period are apparently to be attributed to the fine taste in tailoring of the "first gentleman." The Duke of Sussex had been Colonel under him, and on his death was appointed by the Queen Captain-General. Three years later some members of the Company met together and passed resolutions for various military changes. The Captain-General declared this to be subversive of all military discipline, there being a proper military committee for such matters. The Court of Assistants received the remonstrance not very amiably, insisting that, being citizens as well as soldiers, and serving at their own cost, they were not bound by strict military etiquette. The Captain-General laid the matter before Sir James Graham, who was Home Secretary. Sir James Graham intimated that, unless the Company showed a better disciplined temper, "he must advise the breaking up of a corps where such improper notions and feelings were entertained." The Company, mingling discretion with its valour, submitted; and the Crown took into its own hands the appointment to the posts—previously elective—of the field officers and adjutant. That was rebuff the first. On the death of the Duke of Sussex, Prince Albert was nominated Captain-General and Colonel, and the officers assumed a new forage cap. The Company was exultant at its continued connexion with the Throne. But it found that the new Captain-General took a serious aspect of his duties. In 1849 the less tractable members of the Company, puffed up probably by the splendour of their public services during the Chartist demonstration of the preceding year, persuaded the Annual General Court to pass a Resolution that "the Court of Assistants should have the exclusive cognizance of all offences, civil and military." They obtained a majority in the Court of Assistants, and made the Court address the Queen for a restoration of the old privilege of electing the officers, whether commissioned or non-commissioned. It appeared nevertheless that the numerical strength of the Company was on the side of military authority. While only 126 signed an address to the Prince in favour of the Resolution and Address to Her Majesty, 190 signed an address against both. In vain the former party invoked and obtained the aid of the Court of Aldermen, who represented that their privileges with regard to the exclusion of any regular armed force might lead to the loss by the City of the presence within it of this invaluable body of defenders. The Prince, like the Duke of Sussex, appealed to the Home Office. Sir George Grey threatened, like Sir James Graham, to recommend the dissolution of the Company should it insist upon bearing arms without submitting to ordinary military discipline.

Thus was quenched by the heavy hand of Whig bureaucracy the last spark of the old spirit of civic independence in Bunhill Fields. The uniform was changed; and the photographs of the gallant fellows in their new and prosaic garb present a dreary contrast to the old pictures. Even the gold sash which the superior officers had been specially authorized by King George IV. to wear at Court was stripped off them. The reason alleged was lest they should too closely resemble Guardsmen, as if that had not been the sash's especial value. Unlike the old days, when to bear themselves handsomely and not be prematurely "disguised in liquor" on Lord Mayor's Day was about all which was expected of Honourable Artillerymen, they are now positively "required to attend regimental drills regularly." In its new career we can well believe that the Company acquits itself becomingly, and is remarked for efficiency among Volunteer Corps. Good officers, like Captain Raikes, both record its achievements and secure that they deserve to be recorded. But we must be pardoned by the historiographer for a certain feeling of regret that all is so spick and span and respectable and military among the martial tenants of the dismal old Artillery Ground. There were always courageous

Volunteers and steady Regulars for the asking in England; but there was only one London Artillery Company with its long roll of trivial deeds and queer and pompous pretensions. The Honourable Company, though its name remains, is numbered to all essential purposes with the dead; and Captain Raikes has written its epitaph in two big and painstaking volumes.

ALPHONSE KARR'S LOG-BOOK.*

THE period of 1830 in French literature seems strangely far off to students and critics of the latest generation, who can scarcely realize the violence with which the great conflict between the Classical and Romantic schools was conducted. Yet the greatest leader of the Romanticists still lives, and so do some of the lesser members of the band, one of whom, M. Alphonse Karr, has collected, under the title of *Le Livre de Bord*, some reminiscences which, if scattered and chaotic, are not without attraction. The beginning of M. Karr's career was perhaps more curious than pleasant. In his youth he entered the Collége Bourbon, where he met with M. Legouvé, with Sainte-Beuve and with Gustave Planche. His purse was slender and he paid his "pension" by giving lessons to the lower classes of the Collége. What spare time was left to him he employed in composing a tragedy and a long epic poem. After he had to leave the Collége, on account of a difference with one of the masters, he attempted to obtain a place as a lock-keeper on the Seine, in which position he thought he would find plenty of time to devote to his tragedy. Giving up this scheme, he became an usher in a school kept by an old acquaintance, who appears to have been a most objectionable rascal. This man kept M. Karr on short commons, he cheated him, and finally coming home drunk, attempted to shoot him, on which M. Karr prudently knocked him down and left the house. Then he obtained a master's place at the Collége Bourbon, and devoted all his leisure moments to writing article after article, which he put into the editorial box of the *Figaro*, the columns of which he watched anxiously every Sunday when at a *café* he ran through the file of the past week. On one of these Sundays he was astonished by seeing the heading of one of his articles in print. "M'aurait-on volé mon titre?" he asked himself; "mais non, cette première ligne est de moi et la seconde aussi; c'est un de mes articles; je ne dors pas!" A yet greater surprise was in store for him; the second article was his also, and so was the third. "Il n'y en a que trois; tout le journal est de moi!" The *Figaro* of that day had at least one attentive and contented reader. M. Karr's only touch of disappointment lay in the fact that none of his poetry had been inserted. The following Sunday he went to see Victor Bohain, the editor, and Nestor Roqueplan. "You have been so kind," said Bohain, "for some time past as to send us contributions 'tant en vers qu'en prose.'" "Tant en vers qu'en prose," repeated Nestor with emphasis. "Your verses," continued Bohain, "are charming; but I would sooner die than put one of them into the paper. When I bought it verses were admitted, and we had twenty-eight subscribers. We must have prose, and nothing but prose. What you have done is very good, but you will improve with practice. You must get up politics." Nestor, seeing M. Karr's discomfiture, added, "My dear sir, writing political articles is easier than you seem to think; the *Figaro* is an Opposition paper, and when that is remembered, everything else is simple enough." "Vous attaquez, vous blâmez et vous *blaguez* tout ce que fait le Gouvernement; ses lois sont mauvaises, ses ministres imbéciles; les maitresses de ses ministres sont laides et vieilles; ou les habits des ministres sont chamarrés d'or—et le célèbre Timon, c'est-à-dire M. de Cormenin, prétend que 'cet or est tissé de la sueur du peuple'—ou ces habits sont simples, et alors ce sont des haillons—leurs chevaux sont des rosses, et aucun de leurs discours n'est écrit en Français." "Yes," added Bohain, gravely, "the thing is, as you see, quite simple."

Later on M. Karr learnt how it was that his articles had suddenly appeared in such profusion. The contributors to the *Figaro* had demanded more pay; the editor had refused; and the result was a strike. At that time writers of the highest order were paid at the rate of five francs a column, or less than a sou a line, and what they struck for was an increase of two francs per column. The first day of the strike Bohain and Nestor Roqueplan wrote the whole paper between them; the second they hunted among the outside contributions put aside for possible consideration, and coming upon M. Karr's filled the paper with them. The description of the way in which political articles were manufactured was evidently not overcharged. Bohain and Roqueplan constantly urged M. Karr to pay more attention to politics, and one day they applauded him for an allusion to the intemperate habits of some Minister. "You see," said Nestor, "I told you it was easy enough." "But," replied M. Karr, "I know nothing about such things as these. It was in the columns of the *Figaro* that I first read of this Minister's unhappy fondness for drink." "Do you suppose," said Roqueplan, "that your colleagues know any more about such things than you do? As to this disastrous propensity, I don't see why you shouldn't have invented it as easily as Brucker did, for it is probably not true." "Not true?" asked M. Karr, astounded. "Well, it would perhaps be going too far to assert positively that it is not true; all that is quite certain is that we know nothing about it."

M. Karr gives a too brief account of a dinner given to celebrate his admission on the staff of the *Figaro*, at which were present, besides Bohain and Roqueplan, Jules Janin, Béquet, Méry, Rolle, Alphonse Royer, Gozlan, Blanqui, Brucker, Michel Masson, Léon Vidal, Eléonore de Vaulabelle, and others; and he goes on to tell us how, not long after this dinner, a Government prosecution was instituted against the *Figaro*. The cause for this prosecution was the publication of this sentence—"On a vu hier M. Roux entrer aux Tuileries." Now M. Roux was a celebrated oculist, and to say that he had been seen entering the Tuileries was evidently to say that His Majesty Charles X. was going blind. For this Bohain was sentenced to a year's imprisonment.

This seems startling enough, but it is perhaps hardly more curious than the account which M. Karr gives of newspaper prosecutions in general at that period. The conduct of such cases for the defence was beginning to be exceedingly popular among young advocates, since of course the paper defended, and all other papers of the same political creed, gave every possible publicity to the name of the counsel for the defence, and all possible praise to his speech. One day a young advocate might be walking disconsolate and unknown in the Salle des Pas-Perdus; the next all Paris knew not only his name, but was further told that he was a fit successor to Cicero, Demosthenes, or Mirabeau. Consequently, as of course it was only Opposition papers that stood in need of counsel's aid, the junior bar, or great part of it, went over by degrees to the Opposition. They undertook such cases without a fee, and in their speeches tried, instead of exculpating the paper in other ways, to make out that the writers had not been half severe enough on the conduct of the Government. The result was that the judges became exasperated, that the client got the *maximum* penalty, and the newspaper and the counsel an excellent advertisement. In one case a Government prosecution was eagerly sought for, and regarded as a Heaven-sent deliverance. This was when a paper was in a bad way financially, and its creditors became pressing. The prosecution took place, and saved the concern. "Il n'était pas sans exemple qu'un journal, en pareille circonstance, fût aidé et relevé par ses coreligionnaires. En tout cas on tombait glorieusement sur le champ d'honneur, victime du despotisme de la royauté et du 'parti prêtre.' Ni le marchand de papier ni l'imprimeur n'osaient rien réclamer."

Among M. Karr's extremely rambling and incoherent anecdotes of his newspaper life at this period there is one which relates to one of the many speculations of Victor Bohain. This arose out of the fact that a young man named Napoléon Landais came to M. Karr to beg for a helping hand on the road of literature and journalism. This young man was not a brilliant or an apt young man, and finally M. Karr sent him to Bohain, who had various literary projects on hand, in which Landais's knowledge, such as it was, picked up when he was usher at a school, might be of some use. "I have undertaken to do something for your young man," said Bohain, "for a reason which you will not guess. It is that his name is Napoleon." The "légende Napoléonienne" was then in full force. Louis Philippe was the Napoléon de la paix, Arago the Napoléon de l'astronomie, Véfour the Napoléon de la cuisine, Franconi the Napoléon du cheval, and so on. "I shall make your man," continued Bohain, "work at a great dictionary, which will be published in parts." "But I never told you," replied M. Karr, "that Landais could make a dictionary." "What does that matter? His name is Napoléon, and when the Parisians have seen Napoléon Landais in large letters on the walls for six months, he will be a famous man. As for the dictionary, it's odd if the newest dictionary is not at least as good as the newest but one, for it's simply a question of copying that with a few additions and omissions." In due time the dictionary appeared with complete success; but before this result was attained a vexatious incident befell Bohain. Just when everything was ready for the appearance in a blaze of triumph of the first part, a publisher came to Bohain and said, "M. Landais has made over to me the copyright of this novel which he has written. Read these few pages; they contain over a hundred grammatical blunders. When you publish the dictionary I shall publish the novel with all its faults, and there'll be an end to your scheme." Bohain came to the point with "Combien voulez-vous?" and the affair was arranged; but Bohain's natural comment upon it was, "Quelle sottise d'avoir pris l'homme avec le nom; c'était si facile à inventer ce nom-là!"

CHRONICLES OF NO-MAN'S LAND.*

UNDER this somewhat fanciful title Mr. Boyle has published a third collection of his entertaining papers. Even in the adventurous corps of War Correspondents who hold themselves ready on the shortest notice for missions to any quarter of the globe, few men have seen more service than Mr. Boyle. He has been with the Rajahs of the Brooke dynasty in Borneo; and, if we remember rightly, with "the grey-eyed filibuster" Walker in Nicaragua; he has made the campaigns of Ashanti and Afghanistan with the British troops, and accompanied the forces of Turks and Russians in the more ferocious warfare in Servia and Bulgaria; he has lived with the silver miners of Chontales and the diamond-

* *Chronicles of No-Man's Land.* A Third Series of "Camp Notes." By Fred. Boyle, Author of "To the Cape for Diamonds," &c. London: Chapman & Hall. 1880.

diggers of the Transvaal. Consequently, when he sets his memory to work, or makes reference to his multifarious note-books, he draws upon a rich repertory of varied incident and information. Nobody can complain of lack of variety in his present book; and indeed the most conspicuous feature of the compilation is the designed absence of method. We are hurried in quick transition from one side of the world to the other; and make passing acquaintance in a succession of lively chapters with Malays and Serbs, Ashantis and Pathans.

Mr. Boyle has one characteristic quality of the Special Correspondent. He holds strong opinions and expresses them decidedly—perhaps sometimes too decidedly; though, to do him justice, they are generally founded on close observation and considerable experience. On no subject is he more frankly outspoken than on the emancipated Christian races of the East, whose brilliant capabilities for better things have been the theme of so much burning eloquence among the orators who denounce Lord Beaconsfield as a Mephistopheles. "To feel the due depth of horror which should be excited by 'Bulgarian atrocities,' it is essential that a man should not have visited these countries, should not have talked with refugees." The Serbs, according to Mr. Boyle, are well enough if you take them for what they are—that is to say, for a half-civilized people, with some sprinkling of negative semi-savage virtues. They bear calamities almost too patiently; with a fatalism akin to that of the Turk, but arising rather from stolid apathy than religious sentiment. It is not their fault that they are ignorant and superstitious; but they are callously brutal as well. Without being positively cruel, they were absolutely indifferent to the sufferings of their own wounded. It was not only that they never volunteered for service in the ambulance corps or the hospitals. But Mr. Boyle says that he has seen women step over the bodies of prostrate sufferers lying at their doors without an offer of assistance or even a sign of sympathy. As soldiers he pronounces the men almost worthless; and this was the opinion of Russian officers, who left Servia with a profound contempt for the allies they came to lead. Yet the Serbs spoke so big on the eve of engagements that they deceived even their own countrymen, who ought to have known them better. When Mr. Boyle asked some destitute refugees why they had not used the time at their disposal to place their property in safety, they gave in cautious tones the significant answer, "We thought the Serbs would fight." Nor has he any strong faith in the material prosperity of the country now that it has been relieved from the incubus of Ottoman superiority. The educated upper classes are the most objectionable members of the community. They are puffed up with conceit and shallow self-complacency. Many of them are fairly well off, or even rich; but they take care to place their capital beyond reach of domestic troubles, investing it, for the most part, in Austria and Roumania. Consequently they have a comparatively slight stake in the country, and they leave its politics to penniless adventurers. Ristic rose to the premiership from handling a barber's razor, and his success should say something for his shrewdness, though Mr. Boyle declares him to be anything but clever. If Mr. Boyle's account of the people may be trusted, we can only say it is a pity they are not more prepossessing, since Servia has undoubtedly attractions for tourists. Though it has neither lakes nor mountains, it has magnificent forests, and some of the hill scenery has a gloomy grandeur of its own. As for the living, it must be a miracle of cheapness. We are told that "three-half-pence a pair for fowls is thought no less than robbery at Belgrade"; while Mr. Boyle's native coachman swore and grumbled for a day at an overcharge of fivepence-halfpenny for a couple of fat geese. The Bulgarians are described as still less taking than their Servian neighbours, and more radically vicious. They can boast the single virtue of industry, which explains that rude plenty in their villages which excited the envy of the Russian liberators, while it exculpated the much-abused Turks from the worst charges of habitual oppression. Mr. Boyle has seen a Bulgar family hard at work in their field by the side of the road; and no one of the party lifted his head to cast a glance at the glittering staff of a Russian Grand Duke. But their "stupidity is only matched by their sullen ill-will." Though they love money, they will neither sell nor give. They will fight doggedly when "cornered"; but never if they can help it. As for the malignity of their reprisals on their helpless Turkish neighbours, it surpassed the atrocity of those outrages by Circassians and Bashi-Bazouks which raised the storm of indignant execration through Europe. "In a wine-shop at Sistof a Bulgar was displaying his hacked knife when my courier entered. He said, 'At first I used to go out with a gun, but this is better. I have killed ten of them. I have cut them up like lambs.'" And it must be remembered that the man was a specimen of the "peaceable peasant," and that he had no cause of personal enmity to the helpless victims he butchered.

From Mr. Boyle's gloomy pictures of the races to whom the more emotional philanthropists of Europe would confide the regeneration of the East, we pass to the wilds of West Africa by a natural train of association. In a specially noteworthy chapter entitled "The Resurrection of Ashanti," he gives a strange sketch of the history of the kingdom since Sir Garnet Wolseley shattered the power of Koffee Kalkalli. The authority for his statements is a certain Mr. Kean, who made his way to the capital with a couple of English companions, having been persuaded to the adventure by an article in which Mr. Boyle had spoken of the extraordinary wealth of Ashanti Land in accumulated nuggets and gold dust. The three Englishmen succeeded in reaching Coomassie, passing the deserted forts and stockades that marked the line of the British advance and withdrawal. They were treated with inquisitive civility by the natives, though many districts that used to be covered with villages were now abandoned to jungle and wild animals. The travellers found Coomassie in excitement. There was a great gathering of the caboceers or chiefs, and it seemed evident that the Ashantees were in a political crisis. Yet the Englishmen were suffered to go about much as they pleased; they met nobles in silken robes and golden ornaments, who courteously saluted them; they gazed on the traces of English occupation in the shape of rows of shattered houses still scorched and cracked by fire; and they were only turned back from the sacred precincts of the palace that was tenanted at the time by Koffee Kalkalli in person. But the crowning sensation was to come. On the morrow they were invited to accompany one of the great feudatory princes to a council hall erected in haste, where a grand national palaver was being held. Three hundred chiefs were present, with their immediate attendants grouped behind them. The question for discussion was nothing less than the deposition of Koffee Kalkalli, who was arraigned by a venerable caboceer in a vigorous oration as the destroyer of his country. The monarch was summoned to appear in person and defend himself, and he came accordingly. He was received with ceremonious though chilling respect, and was heard calmly and patiently. He urged that he had been forced into the unfortunate war, but pleaded guilty to the charge of having been singularly unlucky in it. His fetish had deserted him, he said. The sovereign of Ashanti should be the favourite of the gods, and he requested permission to come down from the stool of state, and take his seat in the circle of the caboceers. So it was arranged; and one of his brethren was promptly elected his successor. Perhaps, Mr. Boyle remarks, the strangest act in the strange drama was that which followed. According to all the precedents of barbaric policy, and indeed of certain Courts that call themselves civilized, we should have supposed that the fallen king would have been made away with publicly or privately. It seemed a case for applying the maxim that "stone-dead has no fellow." But, on the contrary, Koffee Kalkalli's homage having been graciously received by his brother, he craved permission to profer a request. He asked no less a boon than the post of commander-in-chief of all the armies of Ashanti, and it was given him on the moment, without any appearance of distrust. Though a minority objected, they grounded their protest on the incompetency of the new-made general, not on the presumption that he would abuse his power. Subsequently the feudatory who had taken the Englishmen under his special protection explained the political situation to them, apparently in consequence of instructions from the King. The allied kingdoms of Ashanti had fallen away from her. She had but ten thousand fighting men, guns for three thousand, and very little powder. On the other hand, Bequoi had twice as many men and guns, with great abundance of ammunition, while Djabin could place fifty thousand soldiers in the field. The caboceer concluded by offering magnificent terms to secure the military services of the Englishmen and the use of "their fetish." It appears that the Englishmen assented; but at that point, as Mr. Boyle informs us, the manuscript of the narrator comes to a tantalizing conclusion. It is of the less consequence that the *dénouement* of the story seems to be matter of history among Europeans on the Gold Coast. The new King had recruited a corps of Houssas, armed with breech-loaders and drilled by the Europeans. By superior discipline and the help of these auxiliaries, the armies of Bequoi were utterly routed, the kingdom again subjected, and the troops brought back into the Ashanti ranks. As for the still more formidable power of Djabin, we are told that its collapse has been even more complete; its capital has been razed from the face of the earth, while its subjects have been likewise absorbed among the Ashantees. Mr. Boyle asserts that the power of Ashanti has become far more formidable than before our invasion; and that these "barbarian" neighbours of ours are fully alive to the fact, and confident in their improved discipline and equipments. "Let those of the late Government," he concludes, "who persuaded us to keep the Gold Coast now observe the situation there and tell us what to do. For those who served in the war are puzzled." We have directed attention to the most interesting or striking articles in the volume, but several of the rest are well worth reading.

AMERICAN LITERATURE.

PROFESSOR WALKER has on more than one former occasion done good service in the diffusion of clearer and more correct notions upon some elementary, but very important, practical principles of political economy than generally prevail among his countrymen. His views, however, are not always orthodox, at least with reference to the standard of thought recognized among French as well as English economists, especially upon the subject of money. As the present work (1) is devoted chiefly to this particular point, it exhibits perhaps less of the author's merits and more of his peculiar defects or eccentricities. It has, however, a merit for which students and opponents alike have reason to be

(1) *Money in its Relations to Trade and Industry.* By Francis A. Walker, Professor of Political Economy and History, Yale College, Author of "The Wages Question," &c. London: Macmillan & Co. 1880.

grateful—that of distinct statement and generally lucid explanation. Two principal points in the present treatise are likely to excite attention and criticism. The first relates to the standard of value, or, as, for the purpose of greater distinctness in the expression of his particular meaning, the author calls it, the standard of deferred payments. Professor Walker frankly admits that for short periods gold or silver (he would perhaps say gold *and* silver) afford the best or at least the most convenient measure of value as well as the only practically available machinery. For short periods the value of the precious metals, and especially of gold, fluctuates less than any other measure that could be adopted; but this could hardly be said of money incomes fixed for a long period. Consequently the Professor proposes, in regard to contracts at long dates—such as leases or national debts—a contract based on the market prices of a great number of articles largely and permanently consumed, these prices to be periodically ascertained by official commissioners. But surely it might have occurred to him that any tendency of the precious metals to depreciation is, in an age like this, sufficiently discounted by the prudence of contracting parties, and that the injustice done is at any rate one of those to which, for common convenience and with no great practical hardship, science as well as Government applies the rule *de minimis*. Still the idea is neither essentially unsound nor impracticable, as is shown by the existence of corn-rents and *metayer* contracts, and the English system of tithe commutation. More serious theoretical, if not practical, objections may be urged against his second special heresy bi-metallism. All the Professor's reasoning cannot get rid of the fact that the comparative value of gold and silver constantly fluctuates. How great and how sudden may be these fluctuations we have recently been reminded to our cost. The double standard, as the Professor himself does not deny, though he fails to make the point so clear as might be desired, simply enables the debtor to avail himself of every such fluctuation to cheat the creditor; or, since the double standard is itself part of the contract, it might be more correct to say, renders all contracts in some degree uncertain, to the disadvantage of the creditor. This injustice or uncertainty is of a much graver and more practical kind than that caused by the secular fluctuations in purchasing power of either metal singly. One very interesting and instructive portion of the book has an historical rather than a practical value. We refer to the author's brief, but clear and tolerably complete, sketch of the causes of the accumulation of the precious metals in royal and imperial treasuries prior to the conquests of Alexander and of the later Roman Republic, the dispersal of these treasures during the period of the Empire, the diminution, if not cessation, of production under the later Cæsars and their barbarian successors, and the consequent "silver famine" of the middle ages, and the extraordinary revolution introduced in this respect by the discovery of America. In a few pages he gives a clear account of a part of economic history too much neglected by historians, and affords to the student a light by which many otherwise half-understood or wholly inexplicable problems may be easily solved.

Mr. S. P. Day's sketches of American life and society (2) are alike unpleasant and unjust. We do not mean to say that many of his criticisms are not well founded, or that the disagreeable incidents and offensive peculiarities he describes may not be met with in the course of a six months' sojourn in the States. But, when the general result of such sketches and criticisms is to represent that as usual which is at most but incidental, or to give undue prominence to the disagreeable features of a picture necessarily drawn in outline, we have a caricature, not a portrait, and a caricature of which a less sensitive people than our Transatlantic cousins might not unnaturally complain. For example, the general impression left on the mind of any reader of this volume wholly unacquainted with America would be that the hotels are thoroughly uncomfortable, and hardly fit for English ladies; at least that ladies must meet with much discomfort and some annoyance in Transatlantic travel. We do not hesitate to say that, despite the necessary intermingling of all classes at a common table, this is not the case. The custom may not be less distasteful to those who cling closely to the reserve and privacy characteristic of English manners than the Continental table d'hôte. But it is certainly not more so. The scrambling, the difficulty of obtaining attention from waiters, described by Mr. Day, does not at all accord with our own experience. On the contrary, nothing seems to us more surprising than the certainty with which travellers do contrive to get fed, and comfortably fed, under the very peculiar and difficult conditions sometimes to be met with in American travelling. A hundred hungry people pour out of a train at a side station where twenty minutes are allowed for a meal. It seems impossible that everybody should be served before the bell rings, and no doubt the time allowed is insufficient for those who habitually regard their comfort and their digestion. But we have seen over and over again how certainly those who will wait will find the implied contract strictly fulfilled, will get for their half dollar or dollar all, even to the cup of rather weak coffee or tea, which the refreshment vendor professes to afford. In the great hotels of such cities as New York, Chicago, and St. Louis, the meals, though less comfortable, are as good as and cheaper than those of English inns whose bills would reach twice or thrice the amount; and if Mr. Day has really found the chambers assigned to him as a bachelor so exceedingly uncomfortable, he must either have been accustomed to much more luxurious accommodation than most bachelors of moderate means find at home, or must have been singularly out of favour with the hotel clerks on whose goodwill he was dependent. The women, especially the young women, and children of the North are doubtless noisy and forward according to the English standard. But perhaps Frenchmen might be similarly impressed by some peculiarities of English usage; and if the traveller's taste may be occasionally offended by a display of reckless noisy talkativeness on the part of young girls, if he is startled by the extreme self-possession, coolness, and independence of the merest children, it is but just to say that it is his taste only that is likely to be offended—that, if the juvenile population of the States are prematurely forward and self-dependent, they have learnt earlier than English children that respect for the rights of others which self-dependence involves and requires. To the South, moreover, and especially to the older settled States on the Atlantic coast, we believe that hardly any of Mr. Day's social criticisms can be applied without a very large deduction. His complaints of the provision for the material comfort of travellers no doubt do apply there to a much greater extent than in the North; but, on the other hand, the hotels, which can no longer feed the traveller as they did before the war, at any rate acknowledge, in the moderation of their charges, the inferior quality of their accommodation. We must agree, however, with one of Mr. Day's remarks. The negroes are by far the best, most agreeable, and most courteous of American servants. Perhaps for this reason they are extensively employed in all those hotels which, not being conducted on the English system, cannot expect to have the civility of their waiters ensured by English methods and at English cost.

Mr. Benjamin's treatise on Art in America (3) is of course open to criticism on the score alike of disappointing omissions and of what seems disproportionate attention given to particular artists or schools. But where individual taste enters so largely into the selection and treatment of the subject this could not but be the case. It is possible also that no other critic would agree in all, perhaps in the majority, of Mr. Benjamin's criticisms, and we shall not add to the number of those who will challenge them. It must be granted that the author has done his best to vindicate them by the insertion of a great number of well-selected illustrations, so executed as to do such justice as small engravings adapted to the pages of a volume of moderate size can do to elaborate landscape and figure paintings in oil. As an ornament to the drawing-room table the book will no doubt be deservedly a favourite.

Mr. Allibone's *Great Authors of all Ages* (4) is hardly true to its title. It begins rather oddly with the name of Pericles, which is attached to the speech recorded by Thucydides in language which, as with all the Thucydidean speeches, is most assuredly the author's and not the orator's. Next come fragments of Cicero, Sallust, and Pliny the Younger; not a line from Cæsar or Tacitus; not one from Herodotus, Xenophon, or Demosthenes. Petrarch, Macchiavelli, Sir Thomas More, Latimer, Ridley, Montaigne, Raleigh, Bacon, Hobbes, Elyot represent, with a few others, what may be called the middle age of European literature. Among modern writers the selection is of course much larger, but perhaps hardly more complete. For what purpose such collections are made it is difficult to understand. Even the most superficial readers of a superficial age and country can hardly suppose that by extracts thus selected they obtain a real knowledge either of the individual authors or of the general character and tone of literature at different periods and in different languages. How much the wiser on any subject would be the reader who should have perused attentively every page of this heavy and closely-printed volume we cannot conceive.

Infinitely greater interest and value belong to the simple story, told in language which, while not affectedly simple, must be intelligible to the youngest children, of Magellan (5), the great discoverer of the Straits that bear his name, the undertaker of the first voyage round the world, though unhappily he did not live to see his enterprise accomplished. The subject is one of profound interest—an interest which children and adults are equally capable of feeling. The incidents, in themselves exciting, are clearly and well told, and an almost absolute freedom from cant and affectation characterizes one of the best volumes of a series for which young and old alike may be grateful to Messrs. Lee and Shepard.

Mr. Waring's *Book of the Farm* (6) will appear to critics unable to apply to it the standard of actual experience to bear that practical character which he claims for it. Its topics seem well arranged, and are certainly treated with remarkable clearness. The author has had no little experience of his own, and has profited largely

(6) *Waring's Book of the Farm; being a Revised Edition of "The Handy-book of Husbandry": a Guide for Farmers.* By George E. Waring, Jun. Illustrated. Philadelphia: Porter & Coats. London: Trübner & Co.

by that of others. He deals with all the various conditions of good farming under American circumstances carefully and elaborately, dwelling more than we might have expected from an American on the importance of manure, the paramount necessity of returning to the soil the elements that are drawn from it, as a rule, with somewhat reckless eagerness. The work contains many hints that may be useful to those who are not farmers in the poultry-yard, the stable, or the garden.

Mr. Dana's work on the Corals and Coral Islands (7) whose history involves some of the most important and doubtful questions in the natural history of the globe we inhabit, is less ...ry and technical than it appears at first sight, and makes no demand on the patience or attention of the reader that the subject or the author's treatment of it does not fully warrant. A great majority of well-read men and women have probably but a very dim idea of the real character of the various coralline structures and of the polyps by which they have been in some sense built; a very faint notion even of the form and appearance of the living or dead varieties, save only that which, distinguished as the precious coral, is the best known and most valued of all, but perhaps, from any other point of view than that of purely human use, the least important. A little time given to Mr. Dana's well-written and excellently printed work, with its few clear and well-executed illustrations, will enable any reader of average intelligence to understand what the coral islands are, how they have been formed, what is the appearance, what the life of the creatures by which they have been in the course of ages constructed, and what are the circumstances under which alone they can come into existence; by a knowledge of which their part in the geological history of the world can be assigned, and important inferences drawn with regard to the past of those seas in which alone they are found. Mr. Dana has come to the conclusion, strongly urged by the most recent and best-informed authorities, that the atoll, the barrier, and nearly all the forms of coral islands or lagoons to be found chiefly in the equatorial waters of the Pacific imply a gradual but very slow subsidence of ground which must, when their work began, have been within twenty fathoms of the surface; and that this, as is proved by the height of many of these structures, must have gone on sinking for thousands of years and hundreds of feet afterwards. Mr. Dana argues, and apparently on sufficient grounds, that the coral reefs to which atolls and islands alike owe their peculiar character and construction, can come into existence only where subsidence is going on at a certain very slow rate; that this, with the other conditions of their existence, occurred only in those parts of the world where coral reefs are found, chiefly in the Pacific; that the other sunken continents in which, for various reasons, geologists are more or less disposed to believe, probably sank too rapidly to allow the industrious polyps to repair their loss; and that this, and this alone, is the reason why corals are unknown and islands so rare in the Atlantic. The whole subject in all its various branches is well and lucidly treated.

Brazil (8), like most other South American countries, Chili perhaps excepted, is not in the best possible odour with European diplomatists, investors, or emigrants; each class having reasons of its own for trusting the Imperial Government almost as little as the Argentine Republic or the anarchy of Peru. What Brazil might have to say in answer to her various accusers is another matter. The complainants have been heard at ample length, and the defence, if any has been made, has failed to reach the ears or satisfy the judgment of the Old World. Even to travellers a country very little known, and from many points of view both interesting and attractive, does not seem especially agreeable. It is impossible in these days of geographical enthusiasm that a river like the Amazon should not draw numerous adventurers to explore the vast expanse of its branching waters; but somehow we hear or remember more of their sufferings or disappointments than of their successes. If travellers have not much that is absolutely new to tell, they may at any rate describe what they have seen, and tell what they have done and suffered, without feeling that sense of treading on beaten and familiar ground which nowadays might discourage the most adventurous and thorough-going of explorers, even in countries so lately thrown open to European enterprise as China and Japan. Mr. Herbert Smith, who has repeatedly visited Brazil within the last ten years, who first proposed to himself to write about the country because he had seen something of it, and more lately returned thither that he might write a book worth reading, has, we think, fairly accomplished his purpose. He has much to tell of Brazilian life, society, industry, scenery, zoology—in fact, of Brazil in every aspect and from every point of view; and if, in consequence, his book is somewhat solid, the reader will not find it wearisome.

Mr. Packard's treatise on Zoology (9) appeals rather to the student than to the general reader, for whom also it professes to be intended. The latter, we think, will find it too long, too minute, and hardly adapted to his purpose. Indeed the same work can hardly answer both ends. The proportions required are distinct in the two cases. It is to the professed student of zoology that Mr. Packard's work is, we think, likely to be especially useful; and it would seem that the author has spared no pains, thought no elaboration needless, to assist the genuine student in the laboratory or the class-room or to guide his researches out of doors.

A valuable, and in its way an interesting, zoological monograph is Mr. D. G. Elliot's very elaborate synopsis of the Trochilidæ (10), a complete scientific and technical account of all the innumerable species of humming-birds.

What Mr. Root modestly calls in his first title the *A B C of Bee Culture* (11) is really, as described in the sub-title, a cyclopædia of apiculture arranged in the form of a dictionary, and giving minute instructions and counsel, as well as elaborate narratives of experiment in every branch of this interesting art, by the most prominent of the numerous bee-keepers of the States, wherein the production of honey is a large and important industry.

Mr. King's *Trouting on the Brulé River* (12) is a lively and readable, but decidedly too lengthy, account of a pleasantly spent holiday, by one who is at once a hard-working lawyer by profession and an eager enthusiast in angling.

Mr. Batty, the author of a practical treatise on taxidermy (13), contrives to give to what professes to be nothing more than a manual of his art the interest attaching to the personal experiences of a naturalist and sportsman, who has devoted the best years of his life and the skill and intentness of an ardent votary at once of sport and science to the study of the habits of wild creatures, as well as of the means of killing them and preserving their forms to ornament the home or enlighten the frequenters of the museum.

The author of *The Reign of God* (14) has written some four hundred pages to prove that Christian faith and belief in the veracity of Scripture are utterly incompatible with the acceptance of the latest theories of science, of the doctrine of evolution, or indeed of the doctrine of uniform law governing the world since its creation; an argument for which thoughtful and earnest theologians may perhaps not be quite so grateful as the writer evidently expects, or as his zeal and industry might seem to deserve. It has evidently never occurred to him that the conclusion he desires to draw may be exactly inverted. Indeed he supposes himself to have proved at the very outset that no such thing as a "reign of law" exists, or at least can be demonstrated.

Dr. Church's monograph on the Comstock Lode (15), the great silver vein of Nevada, whose extent and limits have even yet not been thoroughly ascertained, has a special technical and scientific value rather than a general interest.

The same may be said of the three numbers of Mr. Van Nostrand's Science Series (16) now before us, which deal with fluid motions, with the theory of the arch, and the form and use of articulate links.

Mr. Gardner's partly professional, partly practical, partly social treatise on *Common Sense in Church Building* (17) has at least the merit of brevity and freedom from perplexing technicalities.

(7) *Corals and Coral Islands.* By James D. Dana, LL.D., Professor of Geology and Mineralogy in Yale College. New York: Dodd, Mead, & Co. London: Trübner & Co. 1879.

THE GERMAN ARMY BILL.

THE absence of Prince BISMARCK deprived the debate on the Army Bill of much of its interest. He may have been too unwell to feel capable of making a serious effort, or, as his admirers themselves seem to have calculated, he may have thought that the part of a peaceful, commonplace speaker was beneath him. If the Bill was not to be made the occasion of a general review of the policy of Europe and Germany, a much humbler person could say all that was to be said in favour of a measure which introduced no novelty, and which no one seriously opposed. It was evident that, before the debate came on, peace had been decided on. The influence, whatever it may have been, which succeeded in publishing an official denunciation of the alarming notices of Russian preparations, ultimately prevailed, and it was determined that Germany should claim once more to be regarded as the special and perpetual protectress of European peace. When, as Count MOLTKE said in the course of the debate, has the German MICHAEL ever drawn his sword except to defend his skin? The question is difficult to answer, because the German MICHAEL has only had his new sword—the sword of the German Empire—for ten short years. During these ten years the sword has not been drawn, but it was very near leaping out of its scabbard in 1875. Then, too, it was his own honest skin that MICHAEL prepared to defend. The interests of his skin seemed to demand that he should slash the skin of JACQUES BONHOMME before his adversary had had time to buy himself a sword long and strong enough to defend himself with. There are exceptions, but there are very few exceptions, to the rule that all wars are defensive in the eyes of those who make them. Even NAPOLEON, when he wanted employment for his troops and distraction for his subjects, invariably represented himself as plotted against, not plotting, and as forced by circumstances over which he had no control to defeat by anticipating the machinations of his enemies. No one doubts that, if Prince BISMARCK wished for war, he would give MICHAEL to understand that his skin was very much in danger. The alarm which Prince BISMARCK has created has been due, not in the least to the new measure of defence which he has recommended to the German Parliament, but entirely to the language he has thought proper to use or authorize in regard to it. What terrified Europe was that this language had all the appearance of the language that usually precedes offensive wars made under colour of being defensive. Why did Prince BISMARCK adopt or sanction this language? Partly, no doubt, to stir MICHAEL up and make him pliable and obedient for the sake of his skin; but also in part, it may be conjectured, to assert his position in Europe, and to remind the world that he could make war if he pleased. The time is not very distant when, in much the same way, Europe was taught to hang on the lips of LOUIS NAPOLEON, and tried to spell the future out of his New Year utterances. The secret of his authority was that he had managed to persuade Europe that he was more ready to fight than any one else. France was taken to be the Power least reluctant to go to war, and the EMPEROR seemed to blow war or peace as he pleased. To secure a recognition of this attitude towards Europe is to command such innumerable advantages in diplomacy that it is not surprising if Prince BISMARCK should take some trouble to remind the world that the mantle of the French EMPEROR has fallen on his shoulders.

If the Army Bill needed to be defended, it could not have had a better defender than Count MOLTKE. The German army is based on a percentage of the population, and as the population has increased, the natural question is not why the army should be increased, but why it should not be increased? Are there any reasons why Germany should virtually reduce her army? It is calculated, and Germans accept the calculation, that one per cent. of the population devoted to active service is, with proportionate reserves, sufficient to defend the country. If the army is not increased as the population increases, it follows that less than one per cent. is thought sufficient. It is true that nothing could better illustrate the enormous size of modern armaments than the fact that the mere increase of the German population in the last few years involves an increase of 20,000 men in the army, or, with the proportionate reserves, 90,000 men. This in itself might be called an army, according to the standard of old times. But, if the population has increased, this addition carries with it no new strain on the population. Can, then, this increased population afford to dispense with the amount of defensive power which its numbers would, according to the German system of calculation, suggest? It might be said that 400,000 men could defend forty-two millions of people as well as forty millions. Whether it would or not must depend altogether on the peculiar circumstances of the country in question. In England we do not increase our army as our population increases, for we think, rightly or wrongly, that our defensive power on land is sufficient to protect our population, although this may be much larger than it used to be. But this is because we trust primarily to our navy; and Englishmen of all parties look to the Government to measure the force of other navies, and always to furnish England with a navy greatly superior to any other. In the same way Germans who ask themselves whether their army can be reduced must look at the position of Germany in Europe, and also at the movements of other Powers. This is no challenge to other Powers; it is merely a piece of common sense, just as it is a piece of common sense that we should ask ourselves what the navies of France, of Italy, or of Germany are like before we decide what our own navy is to be like. Count MOLTKE laid great stress on the exceptional position of Germany as alone having great Powers on all its borders. It is true that France has nothing to fear from Italy, Spain, Switzerland, or Belgium, and that experience has shown that English descents on the French seaboard come to very little. France has only to guard against Germany, although it ought to be taken into account that, in saying this, French skins and not French interests are recognized. Germany has nothing like Algeria, like the French colonies, like the traditional interests of France in Italy, Syria, and Egypt. But it is only France that is thus favourably situated. Austria bordered by Germany, Italy, Russia, and territories formerly or now forming part of Turkey, is much worse off than Germany in point of dangerous neighbours. Russia, again, is pre-eminently exposed to attack, however secure she may seem to be against serious invasion. Her possible enemies encompass her over something like the space of a hemisphere. To say nothing of Turkey, China, England, and the hosts of

savages whom she has half conquered, half alarmed, her geographical position makes her extremely open to attack from a coalition of Germany and Austria. When he referred to the past, Count MOLTKE was unanswerable. When Germany was disunited, she was the easy prey of the foreigner. MICHAEL was always having his skin slashed, not only by Frenchmen and Swedes, but by other MICHAELS who ought to have kept their hands off him. But Germany is united now, and forty-two million MICHAELS are ready to fight for themselves and each other. United Germany, too, has many advantages besides its paramount advantage of union. It can concentrate its forces much more rapidly than Austria or Russia can. The completeness of its network of communications enables it to send its forces here and there as it pleases; and while it has a navy which for offensive purposes is by no means contemptible, its coast-line is easily defended. Altogether, it may perhaps be said that, if France stands first, Germany stands second, among the Great Powers in the advantage of its position.

But when Count MOLTKE points to the actual forces of Russia and France, and shows how very great and imposing they are, there is nothing to say except to acknowledge that Germany has no very good reason for declining to allow the increase of her population to be accompanied by a corresponding increase in her army. France has now a very large force at her disposal. In the last war she had eight army corps, she now has nineteen; she then possessed twenty-six infantry divisions, she now has thirty-eight; she then had twenty-six cavalry brigades, she now has thirty-seven. Count MOLTKE summed up by saying that the effective strength of the French army was double what it had been in 1870. Russia, too, has a largely increased army. She has twenty-four new reserve infantry divisions and twenty-four reserve artillery brigades, and a fourth battalion has been added to a hundred and fifty-two foot regiments. These are very good reasons for urging that the German army shall not be reduced—that is, that it shall follow the standard of population. When the demand for what is called an increase, but what is really a supplementing, of the German army according to a recognized scale is put in this modest way, neither Germans nor outsiders have anything to say against it. In the same way, when the minor portions of the Army Bill are studied, it is entirely for the military authorities of Germany to say whether more officers are required, whether a longer time of active employment is needed for the reserve, and whether three years is not the shortest time in which a recruit can be drilled into a really effective soldier. The German army is strong, not only in numbers, but in the perfection of discipline, in its intelligence, and in its habits of obedience. If one per cent. of the population is to serve under arms, it must be for the good of the country that the one per cent. that serves should be as effective as possible. But, after all, this very effective army is a great burden to the country; and Count MOLTKE, who is much more than a mere strategist, and knows too much of war to underrate its horrors, could not satisfy himself or his hearers without showing that he had studied the very grave questions of the permanence of the military burdens which weigh down all Continental nations, and of the real safeguards against war. He expressed the greatest distrust of all philanthropic and humanitarian movements in the direction of peace, and said that a strong Government alone could decide when partial disarmament was possible, and that the best safeguard against war was a strong Government with a strong army. He showed that wars had arisen, or might arise, from the Government of the country which made war being too weak to resist a popular longing for war. He did not name the Governments which have been or may be too weak; but it did not need names for his hearers to understand to what Powers he was referring. France may hanker after revenge. Russia has been swept away, and may be swept away again, by a Panslavist movement. Italy may burn to reclaim provinces which Italians with a vague knowledge of history state to be Italian. So far Count MOLTKE was quite justified in what he said. War often comes from a people forcing the hand of a weak Government; but he omitted to notice that war also often comes from a strong Government forcing the hand of a people. The Danish and Austrian wars of Prussia were entirely wars of the Government, not of the people; and so were the Crimean war, and especially the Mexican war of France. After the Empire was established all the wars of the first NAPOLEON were wars of the sovereign. The French invasion of Spain under the Duke of ANGOULÊME, the premature attack of Austria in 1859, the conquest of Algeria, were altogether wars of the Government, not of the people. It is precisely because Prince BISMARCK often seems so much stronger than the German EMPEROR and the German people that Europe is perpetually disquieted as to what Prince BISMARCK may do next. Even in a free nation like England, the rule is that the Government makes war and the people acquiesce in the war because they reasonably think that the Government knows best when war must be made. The Chinese war, the Abyssinian war, the Ashantee war, the Afghan war, were all Government wars. The Zulu war was not even a Government war; it was the war of a minor Government official. As a rule, it may be said that all wars made by a Government are approved or acquiesced in by the people, unless they happen to be disastrous. Prince BISMARCK was only exaggerating a little when he said that he staked his head on the success of the Austrian war. If Prince BISMARCK now told MICHAEL that, to save his skin, he must invade France or Russia, he would only need success to be more idolized than ever, and he would not even risk his head in case of a reverse. The increase in the German army is perfectly justifiable; but we cannot find much comfort in Count MOLTKE's theory of the essentially pacific character of strong Governments.

RUSSIA.

THE peaceable celebration of the Emperor ALEXANDER's twenty-fifth anniversary proved that the audacity of Russian conspirators and the inefficiency of Russian police arrangements, though extraordinary, are not supernatural nor infinite. Although the attempted crime of the following day shows that Nihilist menaces are sometimes the expression of a deliberate purpose, the threats of explosions and conflagrations to take place on the 2nd of March were probably unconnected with any more serious design than the hope of forcing the EMPEROR and the Government into some exhibition of undignified panic. Incendiaries and assassins are not likely to aggravate the chances of detection by announcing beforehand the place and the date of their criminal attempt. In 1848 the English promotors of a much milder form of sedition issued a similar notice or challenge for the 10th of April. The respectable inhabitants of London consequently organized themselves for the suppression of possible disturbance, and the Government took the necessary military precautions; but, when the appointed day arrived, the mob was content to forward a petition to the House of Commons, and the principal result of the crisis was a general and not unpleasant holiday. Under the protection of a police which cannot but have taken warning by recent events, and of a great military force, the EMPEROR has been able to receive in safety the congratulations and good wishes of his subjects. There is no reason to doubt that the loyal enthusiasm of the assembled multitudes was sincere, and that it represented the feelings of the vast mass of the population of the Empire. The murderous attack on Count LORIS MELIKOFF on the following day afforded a terrible illustration of the power of mischief which may be exercised by one desperate man, and still more by a secret body disposing of the services of a succession of more or less willing agents; but there is as yet no sufficient proof that any large class of the community is irreconcilably disloyal. As far as it is at present possible to judge, the nature of the outrages perpetrated shows that the active conspirators are few in number, although their grievances and some of their aspirations may not be confined to themselves. There is no indication of complicity on the part of the populace of the towns; and the peasants are believed to retain their unqualified devotion to the EMPEROR. Both the moderate and the extreme malcontents belong to the educated classes, in which a desire for some share in the government of the country may be expected to prevail. Only fanatics and wild adventurers can hope to attain any political object by murder and arson.

It is possible, but scarcely probable, that the outrage in the Winter Palace may have interfered with the concession of some constitutional reform. The acts of grace which were thought appropriate to the day have consisted in remissions of Crown debts and of the punishments for petty

offences, and of honorary or official promotions. The only administrative innovation is not in the direction of freedom, as it consists in the appointment of a dictator, with unlimited powers, criminal as well as civil. The office created for Count MELIKOFF is evidently temporary, though its duration is not limited by the EMPEROR'S decree. When the devolution of absolute power on a single delegate is no longer thought necessary, hopes of constitutional legislation may perhaps revive. In the meantime no organic change has been even provisionally made. The stream of despotic power can rise no higher than its source. The control over person and property which is vested in Count MELIKOFF must have been already inherent in the Sovereign from whom he derives his commission. In a certain sense the appointment is a higher and more transcendental act of authority than the exercise by the EMPEROR himself of the same powers. The Crown and Parliament of England could not transfer to any other authority the right of general legislation. Count MELIKOFF is empowered to define criminal acts, to determine the penalties, and to pronounce judgment and sentence. If he entertains doubts on any point, he may, at his discretion, ask instructions from the EMPEROR; but no appeal is allowed to any subject. If Count MELIKOFF deserves his reputation as a temperate and prudent administrator, he will as seldom as possible deviate from the ordinary course of proceeding. The regular Courts will supply the most convenient machinery for the administration of justice, and the supplementary process of deportation or imprisonment without trial has long been practised by the police. The employment of juries in criminal cases will necessarily be suspended, and probably it will not be hereafter revived. The institution appears not to be suited to Russian character or tradition, even when the jurors are, as in the trial of VERA SASSULITCH, taken from the upper classes. In more civilized parts of the Continent it has sometimes been difficult to convince juries that they are not entrusted with discretionary powers. It is not desirable that assassins should enjoy impunity because a jury may think the police deserving of censure.

There is great difficulty in relaxing the absolutism which exists in Russia. The classes which desire some admixture of constitutional government might perhaps supply competent advisers to the EMPEROR in his administrative and legislative capacity; but, possessing no political weight in the country, they cannot offer the Government independent support against disaffection or revolution. The functions of an Assembly, or of a consultative Council, would always be dependent on the will of the EMPEROR, although he might have formally denuded himself of the prerogative of revocation. The army and the police to a man would obey him in preference to any rival authority; and, if his supremacy were thought to be endangered, he could at any moment resume absolute power by an appeal to the people. The nobles, the public functionaries, the mercantile and professional classes, are nothing in the estimation of the peasantry and the clergy in comparison with the semi-divine Czar. Any restriction on his executive omnipotence, even if it had been imposed by himself, would be unanimously rejected as an impious usurpation, if it were maintained against his will. The simplest and least invidious check on autocracy would be the establishment of a Cabinet appointed on the advice of a Prime Minister and responsible to its chief. It is thought that the mere suggestion of such an arrangement, with Count SCHOUVALOFF as Premier, has for the time alienated the EMPEROR from his former favourite, who is at the same time his ablest counsellor. A corporate Ministry would probably have enabled the EMPEROR to resist the mischievous pressure which drove him against his apparent will into the Turkish war. If it is true that he has now resolved to discourage the Slavonic agitation, he would act wisely in providing himself with support which, though not independent, would be in some degree external. The opportunity of reorganizing the superior administration cannot be long delayed, though the aged CHANCELLOR still clings to office.

There is some reason to hope that the Russian Government will not at present recur to the hackneyed device of diverting a dangerous agitation into the channel of foreign aggression or war. The rumour of an impending rupture with Germany was from the first incredible; and there seems to be no immediate risk of a collision with England in Asia. The questionable project of a Persian occupation of Herat is apparently abandoned, and the scheme of splitting up Afghanistan into two or three Principalities is disavowed by the Government, though some measure of the kind may perhaps eventually be found unavoidable. The Russian expedition against the Turcomans will be prosecuted with vigour, and probably to a successful issue; but the newspapers are at present instructed to represent the enterprise as unimportant, for the apparent purpose of conciliating English jealousies. Nothing is known of the nature of the overtures which are said to be made through Prince LOBANOFF with a view to an amicable arrangement of English and Russian pretensions in Central Asia; but, if both parties are sincerely desirous of peace, it will not be impossible to settle terms of compromise. It is true that Russia would expect to receive some equivalent for any concession which may be made; but a diplomatic bargain, like a private contract, necessarily involves covenants by both parties. There is at present no reason to suppose that any negotiation which may be instituted will be liable to disturbance by reason of a personal change in the Russian Government. The Emperor ALEXANDER is about to retire, as usual, to Livadia; and he has not announced any purpose of abdication. The family discords and jealousies which are said to have lately disturbed his Court and household have probably been imagined or greatly exaggerated. It is not known that the members of the Imperial family resent the appointment of Count MELIKOFF, which in no manner affects their interests. If no further conspiracies occur, the extraordinary measures which have been adopted will be gradually discontinued; but the attempted assassination of the GOVERNOR-GENERAL renders it impossible to hope for an early relaxation of precautions which are justifiable if they prove to be effective.

THE SIX SEATS.

THE postponement of the Bill for apportioning the six vacant seats may have been unavoidable in the pressure of public business; but, if the Government had been eager to proceed with the measure, an earlier opportunity would have been found, and the indifference with which the postponement was received by the House raises a doubt whether it will be passed before the dissolution. The rumoured scheme for supplying the vacancies is unobjectionable, if it is admitted that considerable minorities in populous towns and counties are entitled to representation; but, as long as the principle is not universally accepted, it is undesirable to add indefinitely to the number of constituencies which return each three members. The ingenious contrivance of allowing to each elector only two votes has, except in Birmingham, for the most part answered the purpose of its inventors; but the plan fails when the representative of the minority vacates his seat in the middle of a Parliamentary term. Through a casualty of this kind Glasgow has now three Liberal members, although a Conservative was returned in 1874. The addition of a third member to the representation of Bristol will secure a vote to the present Government, and a similar result will probably be attained at Sheffield, though the hope of retrieving the late defeat has not been abandoned. The preference given to the city of Dublin and the county of Cork over English and Scotch claimants is probably intended to gratify Irish patriotism. One or both constituencies will perhaps reward the Ministers for their discernment by returning one of their supporters. But it would not be advantageous to the Conservative party to rely for any considerable portion of its strength on the support of members representing minorities. A victory in an equal contest for an ordinary borough such as Southwark is a far more valuable triumph than the probable election of members of the party at Bristol and Sheffield. It is true that in some large towns, including Liverpool, and in several counties, the Liberals in their turn profit by the limits imposed on the absolute power of the majority; but, on the whole, the party which inclines to democratic opinions would prefer the maintenance in every constituency of the absolute supremacy of numbers.

No enthusiastic interest has been at any time felt in the disposal of the vacant seats, though when, in the course of last Session, Sir STAFFORD NORTHCOTE said that there was

no reason for haste, the inference that dissolution was not the imminent was eagerly or unwillingly drawn by contending parties. The theoretical arguments for completing the number of the House of Commons are perhaps stronger than the objections. It seems reasonable to take the opportunity afforded by the disfranchisement of a corrupt borough to diminish inequalities of representation which are popularly regarded as anomalous. Many large towns, including London, and several populous counties have far less than the proportion of members which would be allotted to them in a new arrangement of electoral districts; and perhaps some projectors may cherish doctrines as fantastic as Mr. GLADSTONE'S discovery that representation ought to vary with distance from the seat of legislation. Advocates of the rights of minorities wish to extend the system of three-cornered constituencies, although the balance of parties may not be affected when large Conservative counties are set off against large Liberal boroughs. The chief difficulty in the distribution of vacant seats arises from the suspicion with which any definite measure is certain to be received. No Government is likely to inflict intentional injury on its own party, and it is still less probable that any Government will obtain credit for disinterested impartiality. When Mr. DISRAELI said that he had given a member to the University of London for the exclusive benefit of Mr. LOWE, he was not understood to be speaking seriously. All the actual or probable claimants have plausible pretensions, and few among them can deny that their competitors are almost equally entitled to consideration.

It may be added that, with the exception of active political managers and of possible candidates, the imperfectly represented portion of the community is not deeply anxious for additional electoral privileges. New constituencies are necessarily large; and the privilege of returning the twenty-thousandth part of a member has not an unlimited value. An imaginary legislator, at liberty to consider only the character of the House of Commons, might perhaps be inclined rather to multiply than to curtail arithmetical anomalies. The little borough of Ripon, which has sent to Parliament far more than its share of eminent lawyers and statesmen, is again about to render good service to the State by providing for Mr. GOSCHEN a refuge from the real or anticipated caprice of the City of London. The Radnor Boroughs have for twelve years returned Lord HARTINGTON, and not many years ago they were represented by Sir G. C. LEWIS. Midhurst, Calne, and other small constituencies which happily and almost unaccountably survive, are more scrupulous than many large towns and counties in the qualifications which they require from their members. Any project of the kind is of course as unsubstantial as a dream. One of many reasons for regarding historical accidents with tenderness is that they cannot be artificially reproduced. Even if such an experiment were practicable, small constituencies ought to be exceptions to the general representation of the mass of the community. No rational politician would wish to dispense with the popular authority which attaches to members for great cities and large districts. Six new seats ought to add something more than as many votes to the party or parties which will profit by Sir S. NORTHCOTE'S proposed legislation. The public interest will not be greatly affected by his decision among conflicting demands.

Except for polemical purposes the Liberal party will be comparatively indifferent to provisions which they will on probable grounds hold to be only temporary. They are, with one or two exceptions, pledged to uniformity of suffrage, and therefore by a necessary consequence to a large redistribution of seats. Some of the most active members of the party, including Mr. BRIGHT and Mr. CHAMBERLAIN, will use their utmost efforts to repeal the existing laws which to a certain extent provide for the representation of minorities. The same object will be more effectually attained by the suppression of small boroughs following the abolition of Conservative supremacy in the counties. It is not even necessary for the purposes of uniform suffrage and redistribution that the Liberal party should succeed at the general election, for many Conservatives have improvidently fallen into the habit of speaking of the concession of household county suffrage as a mere question of time. Those who believe that the change is likely to be made will feel but moderate interest in a provisional rearrangement of seats. There was a time before the first Reform Bill when still smaller legislative measures raised important political issues, and in one instance dislocated parties. The extension of the boundaries of East Retford, in preference to the transfer of the seat to a large manufacturing town, broke up the alliance between the Duke of WELLINGTON and the followers of CANNING. Some years before, Lord LIVERPOOL had, in the tone of a speaker who enunciated a commonplace, contended in the House of Lords that Leeds was happy and prosperous because it was exempt from the turmoil of periodical elections. A Minister in the present day is relieved from the necessity of maintaining unpopular paradoxes. He may even trust, though a Conservative, to the judgment of large constituencies, when he remembers the services rendered to his party by Southwark and by Liverpool.

The desire of towns and districts for separate representation is perhaps conventional; or rather it is mainly confined to small knots of active politicians, and to professional candidates for employment in various departments of agency. For purposes of legislation and public discussion it is proper to assume that the power of electing one or more members is a boon as well as a privilege. The party which commands a majority in the new constituency may also feel a certain satisfaction in the opportunity of promoting its doctrines. But the grant to a borough or a county of a third member may often be resented as an injury by the dominant party. The vote is likely to be secured by the local minority with the result of disturbing existing political arrangements. Mr. BRIGHT is in the habit of repeating the hypothetical complaint that if Birmingham failed to return, as at present, three Liberal members, a Conservative colleague would neutralize the vote of himself, or of his Liberal colleague. It may be conjectured, by the aid of recent experience, that at Liverpool the right of returning three members affects in the same manner the Conservative representation. The City of London with its four members enjoys the peculiar advantage of securing to a large majority three-fourths of the representation. On the whole, as a rule, the old system of giving two members to each constituency, large or small, is probably the best; but it is well to try other experiments to a limited extent. The representation of minorities has the disadvantage of not being secure. If democratic principles generally prevail, those who rely on the numerical strength of their partisans will not permanently tolerate any check to the popular will. It is not impossible that, in a general redistribution of seats, the triangular constituencies may be swept away.

THE ARMY.

COLONEL STANLEY must have been a happy man on Monday night. Of late years the Army Estimates have been too much like an unusually heavy goods train, which is shunted out of the way to make room for everything else, and may think itself lucky if it is able to go five miles on end without being pulled up. This year these same Estimates have been voted at express speed. A single sitting has seen the beginning and the end of them. It is early days to be finding fault with the too great rapidity with which public business is disposed of; but it is impossible not to feel that if the Estimates are despatched at this pace, they might almost as well have been taken as read. There was certainly no obstruction, but then there was no criticism either. The money was voted almost without a word. Ten millions is rather a large sum to be disposed of in this way; and if the result of the experience the House has had of obstruction during the last three Sessions is to silence every member who is competent to question the propriety of a particular outlay, the English pocket may yet suffer as much as the English temper has suffered in former years.

It is true that the Army Estimates for 1880–81 are unusually devoid of interest. Whatever curiosity is felt about military affairs centres upon the expected Report of Lord AIREY'S Committee. The whole system under which the army is at present organized is on its trial, and when this is known to be the case, it is difficult to pay much attention to items of expenditure that recur every year. The evidence taken by this Committee ought to set at rest the doubts which have of late been so abundant with respect to the fitness of a short-service system for the multifarious

requirements of the English army. Until the work of the Committee is done, the possibility that considerable changes may be proposed cannot be altogether put aside. The consequence is that no one cares very much about the comparatively trifling changes which are needed to bring the existing system into a state of decent efficiency. This is unfortunate, inasmuch as there is no security that the report of the Committee when presented will be, or indeed ought to be, made the basis of legislation; and if it is not, the army will go for at least another year with undoubted defects left unremedied, because next year it is possible that more problematical defects will be in course of being remedied. Considering how much there is in the army which needs no Committee to show that it is faulty, it would have been well if Colonel STANLEY's speech had told us more of those unobtrusive reforms which must always be in progress if a complicated system is to be kept in good working order. For example, Colonel STANLEY might profitably have repeated the assurance, given but never acted on, of his predecessor, that the English army should not be entirely composed of skeleton regiments. It is essential, no doubt, to a short-service system that a large proportion of regiments should, in time of peace, be skeletons. If every regiment were maintained at its full strength, the framework of the enlarged army which would be called into being as soon as war became imminent would be wanting. The Reserves would have no places to fall into, and no officers to command them. If the promise relating to the eighteen regiments first on the roster for foreign service had been kept as well as made, there would have been no cause for dissatisfaction. Taking this number as about equivalent to an army corps, the ordinary needs of English policy would be answered if it were maintained in a state of constant efficiency. The reason of the thing is even too obvious. If anything whatever could be said against it, the military authorities would be tempted to defend the regulation, and there might be a chance of their giving effect to it. As it is, there is no ground to suppose that we are better prepared, or even in the way to be better prepared, for meeting any sudden call upon our resources than we were when reinforcements were ordered to South Africa. Unless every military theory is at fault, soldiers, before taking the field, ought to know one another and to know their officers. Without this they are no better than a capable mob—capable, because they can be brought into order much more rapidly than if they were not soldiers to begin with—but a mob, inasmuch as they have not yet been brought into order. Yet this was precisely the condition in which we sent off troops for immediate and trying service in Zululand. The normal condition of the regiments that stood first on the roster was to be short of something like half their full strength; and as soon as the order to embark came, the gaps had to be filled up by volunteers from other battalions. The new men had never seen either the officers who were to lead them into action or the comrades by whose side they were to fight. They were necessarily destitute of regimental feeling or traditions, for if they won honours, it would be for a regiment to which they did not really belong. We say nothing as to the want of preparation which was disclosed at the same time. That may be gathered from the fact that sentimental newspapers went into ecstasies because we accomplished with tremendous toil in about three weeks what, if things had been in proper train, ought to have been accomplished easily in twenty-four hours. It was natural to look to Colonel STANLEY's speech for some assurance that this disgraceful state of things would never recur. Nothing of the kind, however, is to be found there, and as the SECRETARY of STATE must be at least as anxious as other people to prevent its recurrence, it must be presumed that he has no such assurance to give. At all events, it is better to have no assurances at all than assurances of the kind furnished by Sir GARNET WOLSELEY in his singularly ill-judged "report in answer to inquiries" as to the conduct of these very troops. It is to be hoped that the SECRETARY of STATE will not allow Dr. RUSSELL's charges to go unnoticed, unless there is something more to be said in disproof of them than has yet been alleged.

The recruits in 1879 were fewer than in 1878 by about two thousand four hundred, and those in 1877 by two thousand eight hundred. On the face of it this is not particularly satisfactory. It is true that the shortcoming is in part due to the raising of the standard and to the increased care shown in passing recruits. It may be hoped, therefore, that, if the quantity is somewhat less, the quality is somewhat better, and that the recruits we did get last year contained a larger percentage of men to boys, and of men physically qualified for hard work. Still the English army is not numerically strong enough to stand with impunity any constant diminution in the number of recruits. However great may have been the improvement in the men enlisted last year, there were fewer enlisted than were wanted. This is plain from the consoling tone in which Colonel STANLEY says that, although recruiting has slightly fallen off, "the only "fall below the establishment to any considerable extent "has been in the Royal Artillery." There only have we many men less than we need; everywhere else we have only a few less than we need. It is to be noted, also, that down to quite the end of the year the recruiting sergeant had a very slack demand for labour to compete with. This year he will find the market in a very different state, and there is some room for fear that, if the higher standard and greater care of which Colonel STANLEY speaks are maintained—and, beyond question, they ought to be maintained—the recruiting of the present year will show a still scantier supply of men. The most satisfactory point in Colonel STANLEY's speech was the diminution in the number of desertions. The percentage of deserters to recruits in 1879 was 15 as against 19 in 1878, and 17 in 1877. The provision in the Army Discipline Act which allows a recruit to claim his discharge within a specified period from his enlisting, is not yet well known; and Colonel STANLEY expects that, as it becomes known, the number of deserters will decrease. Under the old plan a certain proportion of recruits had always repented of what they had done by the time they joined their regiment, and to them the temptation to desert was naturally very strong. The beginning of a soldier's life is not likely to be attractive to men who have no longer even the initial wish to be a soldier. As regards recruits of this type the system was an ingenious combination of the faults of a conscription with those of voluntary enlistment. The State could not lay hands upon whom it would, and yet those upon whom it did lay hands were not always willing captives. The number of re-enlistments after desertion continues much the same, and is not likely to diminish so long as to bear a sign of belonging to the English army is considered a disgrace.

PUBLICANS AND POLITICS.

THE licensed victuallers have special organs of their own, in which their claims are urged, their rights defended, and their special views expounded. A close organization supplies the means of enforcing a concurrence of action throughout England, and those who guide this Association have at least the merit of knowing exactly what they want, and of saying what they mean. These organs naturally regard the Southwark election as a great triumph for the interests they represent. But they are peculiarly anxious to have it understood that to publicans it is a matter of complete indifference that the triumph of beer was also a triumph of Conservatism. The licensed victuallers are not so much apart from as above party. To them it is perfectly immaterial what a candidate thinks about Russia, or Home Rule, or the county franchise. He may attack or defend budgets, wars, or treaties. The one question is whether he is or is not sound about beer. If he is sound on that cardinal point, he is to be zealously supported against an unsound or wavering candidate. The publicans are perfectly fair, and would place the great beer interest at the disposal of the fiercest Radical who would pledge himself that the flow of genuine liquor should be unimpeded, against the staunchest Conservative who ventured to hint that a check might not improperly be imposed on the mighty volume of the river of beer. But a Conservative candidate has at starting the great advantage of coming better recommended, for he belongs to a party that is believed to be generally sound, while a Liberal belongs to a party that is believed to be generally unsound. Even if a Liberal expresses a hearty and sincere detestation of local option, Sunday closing, abridged hours, and other abominations, he is eyed with suspicion, and hesitating publicans ask what is this striped and streaked animal that is coming over in this curious way from the fold of the black sheep into the fold of the

white. A Liberal candidate may overcome distrust, but he has distrust to overcome. He himself may be pronounced harmless; but then, he wants to get into Parliament in order to support and work with persons who are decidedly dangerous. The publicans, therefore, will keep him out of Parliament if they can, and in many constituencies they can and will keep him out. There are indeed influences against which the publicans cannot contend. A Liberal candidate may be personally very popular, like the Liberal member for Oxford, or have overpowering family claims like the Liberal member for Calne, or be supported by a perfected political machinery like the Liberal members for Birmingham. Or there may be some issue presented to the constituencies in which the electors take a deep interest. When they had got the Irish Church in their heads, the electors had no room for thoughts of beer. But in quiet times, and when in point of personal pretensions and qualifications there is little to choose between candidates, the publicans have a very great influence. It is quite possible that the next election may be fought in a very quiet time. The fever of discussion which attacks on the foreign policy of the Ministry furnished has died away, and the addresses of candidates will chiefly refer to subjects on which it is felt that there is much to be said on both sides. The publicans will find that calm and peace in the electoral mind which possesses a favourable field for the winning arguments of beer. The publicans have the great advantage that those whom they wish to canvass come to them. They have not to look up reluctant householders or intrude unwelcome dissertations. It is the voters who come gaily and gladly to the publicans, and in an easy and animated chat the publican instils into the mind of a sociable customer the arguments that experience has shown to be the most convincing. He does not dwell much on the constitutional danger and difficulty of confiding to a parish what ought to be the task of Parliament. Such a topic is rather too lofty and fatiguing for the uninstructed mind in its moments of social ease. Nor does he say much as to the iniquity of despoiling his own injured class, for he knows that even the customers of publicans think more of their own sorrows than of his. But he insists, and he seldom insists in vain, on the unfairness of denying to the poor what the rich take care to retain for themselves. The rich are to have every variety of delicate liquor day and night at their command. The poor alone are to be deprived of the humble fluid in which their soul rejoices. It is so un-English to "rob a poor man of his beer." Inspirited, charmed, and instructed, the voter goes away and determines that there shall be one more true Englishman at the poll, and one more champion of the poor.

Without having come under the spell of the fascinating publican, impartial persons may acknowledge that it is a very bad precedent for Parliament to delegate its functions to a parish, and that it is the fanaticism of philanthropy to try to cure the vices of the poor by denying them a pleasure which the rich retain unimpaired. But a Liberal candidate has to think how he is to get into Parliament, and when he finds the publicans lost to him, or, as is generally the case, knows beforehand that they are lost to him, he seeks his new world to redress the balance of the old. Local option is the new world which he usually calls in. And if he can satisfy his conscience on the constitutional question, he may say to himself, with very great plausibility, that local option is much misunderstood and is not liable to the reproach that it would rob publicans or deprive a poor man of his beer. If England is taken as a whole, the result of local option would probably be that the publican would gain more than he would lose, and the poor man would gain too, if to have more beer offered him is a gain. It is admitted on all hands that Parliament would never pass a Bill giving the power of local option except with a provision requiring publicans thrown out of business to be adequately compensated. Local option might possibly prevent some new public-houses being opened, but in doing this it would only secure the fortunes of existing public-houses. If the parish that was exercising its local option chose to shut up existing public-houses it would have to pay compensation. The essence of local option is that the body exercising it should have the powers and responsibilities of Parliament in regard to beer. If it exercises its powers it comes under its responsibilities. The rates must be charged for a term of years with a sum by means of which the amount borrowed to compensate the publicans may be paid off. It would not be easy to get ratepayers to undertake the burden. To buy out all the publicans would ruin the ratepayers, and if a few only were bought out, the value of the houses remaining untouched would rise, and so compensation would become gradually more and more onerous. There is, too, another consideration which would weigh with ratepayers. The parish that is to be entrusted with local option will decide not only how few public-houses there are to be, but how many. Some sort of body elected from time to time is, we suppose, to decide how many or how few public-houses are wanted. A body elected at one time might overrule a body elected at another time. The new-comers might think that there were not enough public-houses for the reasonable accommodation of the inhabitants. New houses would be licensed, and those who were paying extra rates for the suppression of some houses, would see others opened, and could scarcely help feeling that they were paying their money for nothing. The burden of the rates would be permanent or at least would continue for a long time, while there might be rapid fluctuations on the great question of beer in the minds of the electors. But there would be this inequality among the holders of different opinions, that those who were in favour of beer could undo the work of their predecessors without adding to the rates, while those who were against beer could only regain the position they had lost by throwing new burdens on the ratepayers. It may further be remarked that the principle of local option, if once adopted, goes a very long way. There is such a thing as the tyranny of philanthropy. Cases where such a tyranny is exercised must necessarily be rare, but they are not imaginary. There is in the United Kingdom a town of eight thousand inhabitants where the landowner, who happens to own every foot of the soil, has announced his intention of shutting up every public-house. There is nothing in the law as it now is to stop this vexatious proceeding. But if the town affected had local option with Parliamentary powers, it would decide how many public-houses it needed, and would justly claim the Parliamentary right of expropriation. The landowner would be compelled to sell sites for a fit number of public-houses just as he would be compelled to sell land for a railway or a canal, and local option would have not the un-English effect of robbing a poor man of his beer, but the very English effect of restoring to the poor man the beer of which he had been robbed.

Local option is generally understood to refer only to licensing, and if it refers only to licensing, it may be reasonably contended that, however objectionable on constitutional grounds, it is not calculated to injure the publicans or to stint the poor. The publicans naturally object to it, because they do not want to have themselves and their doings made the subject of everlasting discussion, and because, although they might not be injured by it, they would have to take a large amount of trouble to ensure not being injured by it. But if local option is to go beyond licensing, and to extend to determining the hours of closing, then, no doubt, the publicans might possibly be injured and the poor stinted. It is especially the question of Sunday closing that would be fought out in the various spheres of local option. Public-houses are now closed on Sundays in Scotland and Ireland, and there is a very strong movement headed by an Archbishop for closing public-houses on Sundays in England. No compensation is given to the owners or lessees of public-houses for Sunday closing, and thus the ratepayers would have no pecuniary reasons for not closing the houses on Sundays. Public-houses are closed on Sundays in Scotland and Ireland because the Scotch and Irish wish them to be closed. In England the general feeling is that they should be open, not for the sake of the publicans, many of whom would not at all object to Sunday closing, but for the sake of the poor. But there can be no doubt that if every English parish had to decide whether public-houses were to be kept open on Sunday or not, there are many parishes in which public-houses would be closed. We are unable to see any reason in principle why, if local option is to be allowed, the parishes should not settle for themselves the question of closing or keeping open public-houses on Sunday just as they would settle every other question about beer. We have [illegible]

Sabbath observance in every English parish would be a great calamity; and, if local option is to extend so far, there is a new and grave objection to it added to the numerous objections to which on constitutional grounds it is exposed.

THE AMERICAN PRESIDENCY.

FOR some time past the chances have been in favour of the nomination of General GRANT as Republican candidate for the Presidency of the United States. The State Conventions of Pennsylvania, New York, and Illinois have instructed their delegates to support him at Chicago; and Mr. CONKLING defeated a proposal that the New York Delegates should be instructed to vote for Mr. BLAINE as a second choice. General GRANT's Republican competitors are exposed to the common disadvantage of equal mediocrity. Except to those who may be familiar with the details of party politics, there seems to be no reason for preferring Mr. BLAINE to Mr. SHERMAN, or either of them to Mr. CONKLING. They are all active politicians; they have all ability and a certain influence; and they all probably concur in their dislike to any organic change in the existing mode of distributing patronage. The revenue officers throughout the United States are at the present time actively supporting Mr. SHERMAN, as a recognized official duty to be discharged at their peril. A prohibition of the practice by the actual President has never been regarded as operative. If Mr. SHERMAN or Mr. BLAINE becomes President, he will, like Mr. HAYES, excite no personal enthusiasm, and he will probably discharge the duties of the office without discredit. Mr. SHERMAN, though his financial orthodoxy is not unsuspected, has on the whole been fortunate in his administration of the Treasury. During his term of office a large portion of the debt has been paid off and re-borrowed at a lower rate of interest, and the paper currency has risen to par. He has sometimes been too sanguine in attributing to himself the merit or luck of having resumed specie payments, for greenbacks are still a legal tender; and if circumstances caused their depreciation, gold would again disappear from circulation. To Mr. SHERMAN's credit he has endeavoured, not without effect, to counteract the unwise legislation which rewarded the exertions of those who were interested in the production of silver. The Treasury or the Mint has contrived so far to restrict the coinage of silver that it has not to any considerable extent superseded gold and greenbacks. Mr. CONKLING and Mr. BLAINE are supposed to hold the same opinions on currency with Mr. SHERMAN, and all the aspirants support the protective policy which is approved by nearly the whole Republican party. If the tenure of power by the Republicans were secure, the managers of the State Conventions would probably indulge their special predilections in the choice of the delegation to Chicago; but they will agree in thinking that it is more necessary to defeat the common enemy than to secure the nomination to their favourite candidates.

The Democrats, though they have not abandoned the hope of retrieving the miscarriage of 1876, have not yet agreed on a nominee. It has often been asserted that Mr. TILDEN was no longer a possible candidate; but he has not yet been confronted with any formidable rival. The secession at the New York State election of Mr. KELLY and the Tammany Hall faction was supposed, as it enabled the Republicans to elect a Governor, to have inflicted a heavy blow on Mr. TILDEN; but he is believed to have since patched up the feud with KELLY; and it is in any case improbable that the majority of voters in the State will allow the Republicans a second time to profit by the internal dissensions of the Democrats. As Mr. TILDEN's election was on the last occasion only avoided by gross fraud, he may perhaps be thought by his party to have a legitimate claim to the succession. His merits, which seem to consist mainly in adroit manipulation of elections, were sufficient to command the unanimous support of the Democrats in 1876. He probably never lost a vote in consequence of the outrageous charges of fraud which were preferred against him by Republican journalists during the contest. It is understood that personal calumnies form a recognized branch of American polemics; and if Mr. TILDEN had been guilty, he would probably have been acquitted on the assumption that the imputations on his character were conventional methods of controversy. The State elections of the last autumn indicated a decline of Democratic power; but it is uncertain whether the majority has within four years been reversed. If the calculations of Democratic politicians may be trusted, the Southern States, with the aid of New York, will be strong enough to carry the election. The defection of a single Southern State, or a division of the New York vote, would give the victory to the Republicans, who, as might be expected, dispute the soundness of the Democratic estimate. The trial of strength will not be deranged by the interference of any third or independent organization. The Labour party and the Greenback party have either been dissolved, or have satisfied themselves that they are powerless.

The approximately equal balance of numbers between the two great parties furnishes a strong reason for proposing General GRANT as the Republican candidate. No other Republican would have so fair a chance of detaching a portion of the Democratic body, including perhaps one or two Southern States, from the adverse party. The innovation of a second re-election is not unlikely to strike the fancy of a community which has seldom the opportunity of emerging from commonplace routine. There may be a certain excitement in doing what might have been done at any time, and was never done before. If an exception to uniform practice is to be made, the candidate who is to profit by the disregard of precedent ought to be conspicuous and popular. General GRANT is incomparably better known both to his own countrymen and to foreigners than any other living American, perhaps than any American since WASHINGTON. If he has succeeded but moderately as a President, he has led vast armies to victory; and since the close of his military career he has given himself an unusually complete political education. His natural shrewdness will probably have enabled him to derive instruction from his former mistakes. When he was first elected he was new to party conflicts, and he found himself surrounded and controlled by veteran politicians. After a brief struggle for independence, he succumbed to the party managers, on condition of dividing with them the patronage of the Republic. He cannot but be aware that the corruption which he tolerated during his second term of office was injurious to his own reputation and to that of his party. If he is once more elected, he will be at least equal in experience to any member of his Cabinet or of the Senate, and he will derive strength from an extraordinary proof of popular confidence. It will be no small advantage to an incoming President to have been wholly unconnected with recent party controversies.

From the time when General GRANT's name was proposed for a second re-election there was no serious doubt of his willingness to accept the offer. A voluntary candidature would have been equally impolitic and undignified, and it was judicious in the first instance to display a certain coyness and hesitation; but there was no good reason for declining the highest honour which could be paid to an American citizen, or for renouncing the only suitable object of ambition to which an ex-President can aspire. It was reasonable to assume that General GRANT's friends knew his mind better than strangers, if not better than himself. An active man in middle life, who has already held great positions, is not likely to prefer permanent rest to high employment. It is true that most of his predecessors have subsided into obscurity, scarcely disturbed in the case of one or two of their number by ill-judged re-entrance into public life as members of the Senate or of the House of Representatives. General GRANT is, happily for himself, debarred from seeking distinction as an orator or debater. Former ex-Presidents have seldom possessed either remarkable abilities or claims to distinction on the ground of their public services. Mr. LINCOLN, who formed an exception to the rule of personal insignificance, was himself elected in preference to Mr. SEWARD and other leaders of the party because he was at the time little known. If General GRANT had from the expiration of his second term desired re-election, he could not have promoted his candidature more judiciously than by the course which he has actually followed. The almost royal honours with which he has been received in Europe and in the East gratified the patriotic self-complacency of Americans, while his absence removed him from domestic collisions and jealousies.

It is hardly possible that he can have made a leisurely journey round the world without adding largely to the political knowledge in which he may during his earlier career have been deficient. He has now been personally acquainted with every living statesman; and he has had opportunities of watching the tendencies of the most various political institutions. Even in China and Japan he has, either as a compliment to himself and to his country, or in the hope of some advantage, been consulted on questions of war and peace. To be in sight and out of reach is the most advantageous position for an aspirant to the Presidency. The conjecture that his long travels were not unconnected with legitimate projects of ambition is strengthened by his visit to Cuba and Mexico at the moment when his friends were preparing his nomination. On his way to Havannah he judiciously advertised himself by attending a series of elaborate festivities given in his honour on the eve of the meeting of the Republican State Convention. It is less surprising that he meets with powerful support than that he is not accepted by acclamation as the nominee of the party. If the Democrats prove themselves to be formidable opponents, the Republicans will probably rally round the most eminent candidate who can be found on either side.

THE FRENCH EDUCATION BILL.

THE French Government are either very confident of the success of their Education Bill in the Senate, or very distrustful of their own ability to defend it. The general discussion, which answers to the English debate on the second reading, ran its course and came to an end without a single Minister taking part in it. If the opponents of the Bill had been exclusively taken from the Right, M. FERRY might perhaps have pleaded that between him and them there is no common ground, and that to debate first principles would have been to waste the time of the Senate. But after M. JULES SIMON had spoken this excuse ceased to be of any avail. So long as he was in the Tribune the question was argued upon principles which, in name at least, are M. FERRY's own. The Right, said M. SIMON, dislike this Bill because it is opposed to their religious beliefs; I dislike it because it is opposed to my Republican beliefs. This, at least, was a position which M. FERRY might have been expected not to leave unattacked. M. JULES SIMON is not a Republican of yesterday. He has a right to speak with authority upon what constitutes Republican ideas. To treat his speech as unworthy of a reply was to allow a really grave accusation to go unanswered to the country. When the Right tell M. FERRY that he is not a consistent Republican he may say that they are not good judges. He cannot say this when it is M. JULES SIMON who brings the charge. Undoubtedly M. FERRY would have found it extremely hard to answer M. SIMON. His Education Bill is all that M. SIMON accuses it of being. Indeed, some of its defenders hardly took the trouble to deny this. There was an evident disposition on the Ministerial side to admit that its provisions could not be reconciled with the doctrine of liberty of education as ordinarily understood. It seemed safer to argue that liberty of education was only a secondary and subordinate liberty, to be conceded and enjoyed when it does not conflict with more important liberties. Still, this doctrine is as yet sufficiently novel to stand in some need of Ministerial support, and of Ministerial support it got none. Whether the Government think the theory so self-evident that it may be left to make its own way, or so questionable that it would be imprudent to adopt it, must for the present remain unknown.

M. JULES SIMON wisely laid no stress upon his accidental agreement with the Right. He appealed to the Senate in the character of an impenitent Liberal. The cause of which he has made himself the champion is the freedom of the parent to choose a teacher for his child. The State may do what it pleases about education, provided that it does not contradict this fundamental law. It may provide education for those who like to avail themselves of it. It may refuse to affix its stamp to any educational result with which it is not satisfied. It may do what it can to raise the standard of education in schools which are not under its control. But it has no business to prescribe to a parent that he shall send his child to this school rather than to that. It is for him to decide what manner of person he wishes his child to be, and to take such measures as seem good to him to give effect to his desire. The choice of a teacher is the first and principal of these measures. When the parent delegates to another the duty of teaching his child, he puts into his hands the formation of the child's character. The child learns something from his teachers over and above the particular knowledge which they communicate. There is a moral as well as an intellectual process going on in every class-room. In so far as a parent is forced to commit his child to a moral training in which he has no confidence, the liberty of deciding what manner of person he wishes his child to be is denied him, and M. FERRY's Education Bill does all it can to subject parents to this compulsion. By the Seventh Clause it directly narrows the field of a parent's choice; by other clauses it does so indirectly. The object of the Bill is to subject the free Universities which have grown up since 1875 to a variety of disabilities. They are to be forbidden to call themselves Universities, or even Faculties. Their students must be matriculated at the State University, and examined by its professors. It is not denied by the advocates of the Bill that these regulations are meant to be destructive. They predict that under the weight of them the free Universities will dwindle and die out. First of all, a great number of parents will be tempted to withdraw their children in the belief that they will get on better in their future careers if they go to the State University; and, next, the loss of so many students will render it impossible to keep the free Universities open for the few who will continue to send their sons there. The supporters of the Bill are at all events outspoken. They do not profess to think that the free Universities will prosper under the new legislation. Though the Bill is professedly intended to promote liberty of teaching, its authors avow that this liberty is to be strictly confined to such teaching as they themselves approve.

M. SIMON does not rest his opposition to the Bill entirely on abstract principles. He contends that it will do harm to education and harm to the Republic. The State University itself will be a loser by the monopoly which it is proposed to confer upon it. It has greatly profited by the rivalry to which it has been lately exposed. New Lycées have been opened, new professorships have been founded, and a variety of new facilities have been provided for education of the kind which the authors of the Bill desire to foster. It is improbable that either the Government would have proposed or the Chamber consented to spend money in this way had it not been for the stimulus supplied by competition. The State has not liked to see its University outdone in any way by the free Universities. The higher education has thus been protected against a danger which, if the State University stood alone, might easily become serious. To a country so burdened as France, economy in the expenditure of the taxes is a consideration of immense importance, and nowhere could a saving be more easily effected than in the vote for the University. So long as the free Universities exist there is not the slightest risk of this being attempted, because every saving that is effected in the State University is tantamount to a grant in aid of the free Universities. Take away the free Universities, and there will be nothing to prevent the Government or the Chambers from economizing in this convenient field. When there is no education to be had except in the State Colleges, the quality of the education given in them will become a matter of secondary moment. It will no longer be maintained, as it is now, by the knowledge that, if it is suffered to fall below the level of that given in the free Universities, the State Colleges will by degrees be deserted. The danger of being starved by the Government is not the only danger against which the free Universities serve to protect the State University. There is the further risk of a decline in the intrinsic qualities of the education given. The free Universities are so many additional chances in favour of educational progress. If a professor in a free University discovers a new truth or invents a new method, he cannot keep it to himself. It inevitably becomes the property of the State University as well as of the free Universities. Each is anxious to outstrip the other; but each, whether it will or not, is compelled to draw the other after it.

We shall not be doing the authors of this Bill much injustice if we assume that they will view a merely educational loss with considerable indifference. Provided that they can prevent Catholic parents from sending their children to Catholic Colleges, they will not much care

whether the education given in the State Colleges is better or worse than what used to be given in them. Even with men of this way of thinking, however, M. SIMON'S concluding argument ought to have some weight. If the Republic is to endure in France, it must reassure the consciences of those by whose consent it has to live. If the Republic presents itself to those who are prejudiced against it as a prison, in which all liberty of action is forbidden except to the friends of the gaolers, it will make no progress in the country. If it is to attract fresh inmates, it must show them that the life they will live under its roof will be the life they themselves enjoy. The first thought of a Republican should be to make the Republic loveable. If M. FERRY gains his end, it will be hated by every Catholic in France.

MR. GLADSTONE AND THE NONCONFORMISTS.

IT is said that an anxious clergyman has just applied to Lord HARTINGTON to know whether it is possible for the leaders of the Liberal party to give any support to disestablishment in England. Lord HARTINGTON'S reply as reported was characterized by the caution which only on rare occasions fails him. He was not, he said, himself a member of the Liberation Society, nor was he aware in what way the leaders of the Liberal party had given any countenance to the agitation for disestablishment. We do not know whether the disturbed soul of his correspondent was comforted by this somewhat meagre reply. He might possibly have rejoined that disestablishment accomplished in Ireland, and disestablishment in Scotland avowedly "postponed but not forgotten" (as the Duchess of DEVONSHIRE used to say when she was pestered for invitations), had at least given some countenance to the idea that disestablishment in England and the Liberal leaders were not ideas wholly impossible to be conjoined. But he might also have called Lord HARTINGTON'S attention to some singular remarks of Mr. GLADSTONE'S at an electioneering meeting in Marylebone last week. Mr. GLADSTONE, indeed, is not formally a "leader "of the Liberal party" just at this moment; but most people know well enough that, whether he be nominally or not a leader while the party is in a minority, it is to Mr. GLADSTONE that we must look for the probable lines of Liberal policy should the present Opposition succeed in changing places with the present Ministry. Even putting this out of the question, however, the words to which we have alluded were curious enough, and well enough deserving of a little attention.

It was natural that, speaking in support of the candidature of Sir THOMAS CHAMBERS and Mr. GRANT, Mr. GLADSTONE should deprecate schisms in the Liberal party. But he did more than this. "He pointed to "the Nonconformist section of the Liberal party as "an example to be followed. . . . It was the largest "of all the sections of the party, and its peculiar and "distinctive feature was disestablishment. This had "been erected not merely into a political idea, but into a "religious conviction. But the Nonconformists pursued "it with moderation. They placed their own policy and "beloved conviction in the shade in order not to interfere "with the success of the cause in which they believe their "idea is included and absorbed." And later, so entranced is Mr. GLADSTONE apparently by the spectacle of Nonconformist excellence, he went out of his way to remark that it was mainly by the Nonconformist Liberals that the Government had been deterred from supporting Turkey by force of arms. In these phrases, and in yet another, that "all the different convictions dear to members of the "party were entitled to the most careful and respectful "consideration," there is more than one point which in its turn deserves consideration, careful, if not respectful. For nothing could show better than these last words the inherent vice of that conception of politics and government which has succeeded to the old Whig idea in that portion of the Liberal party which Mr. GLADSTONE represents. Such a party as he describes is, by the law of its being, whenever it comes into power, bound not to consult the good of the nation, but the convictions of its motley array of supporters. While these convictions, adjusted as best they may be, are in turn carefully and respectfully considered, it is not difficult to see that the country must go to the wall. But for the present the particular words which Mr. GLADSTONE devoted to a particular conviction are those which deserve most study. They are not, it is to be noticed, a mere compliment to the Nonconformists, such as those with which Mr. GLADSTONE has often, and elsewhere in this very speech, rewarded the fulsome adulation which the Nonconformists are wont to bestow upon himself. It does no harm, except perhaps to the speaker, to represent the Nonconformists or any other body as the chief, if not the sole, depositaries of virtue, wisdom, and common sense, the salt of the English nation, and so forth. Flattery, unlike five-pound notes, has not yet been forbidden by any statute as a political instrument, and the flatterer and the flattered must be left to settle the use and value of it between them. But the terms of the present tribute to Nonconformist excellence amount to something more than mere flattery. The Nonconformists are, Mr. GLADSTONE tells them, actually the largest section of the Liberal party—a remarkable admission in itself. This largest section of the party, moreover, not merely holds a particular conviction with religious as well as political fervour, but believes that this conviction is "included and absorbed" in the Liberal cause. Thus the Nonconformist ideal is placed on quite a different footing from most of the other ideals which their friends call convictions and their enemies crazes. Very few of these would be allowed even by their warmest partisans to be included and absorbed in the Liberal cause or creed—whatever that may be. The Liberal teetotaller is a Liberal and a teetotaller, not a teetotaller *quâ* Liberal. But the largest section of the Liberal party, by the confession of one who for seven years at least was the undisputed leader of that party, holds that the Liberal creed necessarily includes disestablishment, that disestablishment is an unavoidable product and corollary of Liberalism. After which we are told that all the convictions of the Liberal sects deserve careful and respectful consideration. Most careful surely and most respectful, when the time comes, must be the consideration accorded to this belief of the largest sect of all—a belief which is held, not as a piece of will-worship, but as one of the cardinal doctrines of the faith.

Mr. GLADSTONE has on more than one occasion shown considerable anxiety to shield himself from the charge of inconsistency by going back upon his own words and indicating the precise point at which his infant convictions chipped their shell. It is not at all improbable that the passage upon which we are commenting may have some day to do duty in this respect. When, as is very probable, it becomes clear to Mr. GLADSTONE that his last attempt to stir up a kind of moral jehad against the Government is useless, he will have to look out for some new and more exciting method of calling together his partisans. There is one such method of which it can be said with the utmost truth *probatum est*. If you have a party, and the largest section of that party holds that a certain proceeding is inextricably bound up with the party creed, what more obvious way of encouraging it than to think—as quickly as possible—once, twice, and thrice about it, and then to proclaim it at once as the immediate object of contention? Then Mr. GLADSTONE will have in the words we have quoted a convenient reference. He will be able to point out that, in a phrase of his own, the basis of his convictions first began to "quiver" when he realized how the virtuous Nonconformists held disestablishment to be necessarily the Liberal policy, how they were the backbone of the party, how they had long possessed their souls in patience, and deserved the reward of that careful consideration which is so readily turned into reckless action. It is easy for a politician to fall into the mood of PYM—who, by the way, is always said to have been a steady Churchman himself—and to decide that "it will not do to discourage friends." Indeed a person given to logical consideration of his own position might reasonably feel uncomfortable in such a position as Mr. GLADSTONE describes. He belongs to a party the largest section of which holds that disestablishment is not only desirable in itself, but is actually part of the Liberal cause. Now it is not possible for any man to say that disestablishment is a question of small moment. Its effect upon the whole social, economical, and political fabric, putting religious questions entirely aside, must for weal or for woe be vaster than that of any single legislative act ever accomplished in this country. The largest section of his followers, says Mr. GLADSTONE, thinks that a Liberal *quâ* Liberal is bound to wish for the change. Either, then, his conception of Liberalism is something essentially different from theirs, and they cannot honestly be said to belong to the same party at all, or he is bound to take their views into respectful consideration. No sensible person willingly

attempts political prophecy; and prophecy as to the probable conduct of the Liberal party, as at present constituted and led, would be peculiarly rash. Its leaders—at least its titular leaders—are so frankly opportunist, and at the same time so amiably susceptible to pressure, that this is a matter which may safely defy prediction. Other sections may be even more threatening in their demands for respectful consideration than the Nonconformists; the number of these latter may have been miscalculated by Mr. GLADSTONE's natural partiality to his warmest admirers; it may even be a mistake to suppose that, save among a noisy minority, disestablishment is so dear to the Nonconformists themselves as Mr. GLADSTONE believes. The phrase of yesterday, however, will remain useful. It can be subjected to the familiar process of development which Mr. GLADSTONE's mind is, of all minds, the best calculated to perform in a shorter or longer time as circumstances demand. It can be treated as a mere *ballon d'essai* to see how the political winds blow, or (though, as we have seen, with doubtful legitimacy) as a complimentary illustration and nothing more. But meanwhile it is worth noting, and will very probably be heard of again.

THE GAME-LAWS.

NO one in the House of Commons, perhaps, was quite as wise as might have been wished on Tuesday night. Prudence is not expected from Mr. PETER TAYLOR, but there is no obvious reason why Sir GEORGE CAMPBELL, who has shot at game whenever he has found any to shoot at for five-and-thirty years, should be so anxious to deprive himself in age of the pleasure which he enjoyed in youth. Mr. TAYLOR showed his customary enthusiasm in speaking of poachers. To him this interesting class is still invested with the romance which attached to it in the novels which beguiled his boyish leisure. The human being who hunts somebody else's rabbits is in his eyes the direct descendant of those noble outlaws whose time was equally divided between sport and the redress of baronial wrong-doing. He has never noticed that poaching has gradually come to wear the commercial character which is natural to it in a commercial country. The poacher's ultimate object is the price which the poulterer is impartially willing to pay either to him or to the lawful slayer of the game sold. Sir WALTER BARTTELOT was equally in extremes when he treated the charges brought against the Game-laws and their administration as all alike worthless. It is quite true that we do not require the abolition of the Game-laws in order to get rid of the evils connected with them. This would have been an excellent plea on behalf of an amendment purporting to get rid of the evil in question without abolishing the Game-laws. But it is not equally appropriate when urged on behalf of an amendment "that it is not now expedient to deal with "the question of the Game-laws." Probably Sir WALTER BARTTELOT thought that he had saved his consistency by the introduction of the word "now." But, if a time of unexampled agricultural depression is not appropriate to a rational reform of the Game-laws, it is difficult to conceive when the really convenient season will come. Lord PERCY was no less unfortunate when he defended the Game-laws on the ground that, without them, the gentry who now direct the local affairs of their districts would become absentees. There may be a shadow of truth in the suggestion; but it is not one that can be judiciously put forward on the Conservative side. If the unequalled position of an English country gentleman has no charms for those who enjoy it except the power of shooting hares and pheasants that it carries with it, Radicals will be tempted to say that the importance of the gentry to the neighbourhood by which they set so little store has been overrated.

Mr. READ and Mr. PELL did not, it is needless to say, fall into the blunders of Sir WALTER BARTTELOT and Lord PERCY. They made exceedingly sensible speeches, but they did not show themselves equal to the task of framing an amendment. Mr. READ wishes every farmer to have the privilege of killing hares and rabbits which prey upon his farm, and he believes that it is upon hares and rabbits that almost the whole of the agricultural grievance centres. Mr. PELL says more vaguely that hares and rabbits ought to be kept in their places—a concession which still leaves it uncertain what their places are, and who is to have the right of assigning them. He looks back with fond recollection to a Bill which he himself once introduced, and has hardly yet forgiven the Scotch member who snuffed it out. But neither Mr. READ nor Mr. PELL cared to give the House of Commons the opportunity of adopting, even in the innocent form of an abstract resolution, these moderate and sensible views. Either their fidelity to their party is stronger than their fidelity to their constituents, or they have convinced themselves that in the present Parliament the question cannot be raised to any useful purpose. A somewhat wider view of Conservative interests might have shown them that the subject has now become one of too much interest to farmers to make it safe to put it aside. A good many county votes will probably be given or withheld at the general election according as the elector thinks the candidate likely or unlikely to vote for a reform of the Game-laws. This same reasoning applies with even greater force to the Government. When Sir MATTHEW RIDLEY rose avowedly to state on the part of the Government how they regarded the motion and the amendment, it was to be expected that he would either declare the Game-laws to be perfect, or indicate the direction in which they require amendment. He did neither. The Government, he said, preferred to meet the motion with a direct negative. They could not admit that the Game-laws ought to be abolished, and they did not want to say that it is not now expedient to deal with them. In that case, why did not Sir MATTHEW RIDLEY either bring forward an amendment of his own, embodying the changes of which he thinks the Game-laws are susceptible, or else move the previous question, and state in doing so what the Government proposed ultimately to suggest, and why they did not now suggest it? It is impossible to divine from Sir MATTHEW RIDLEY's speech whether, on the question of the Game-laws, the Government are moderately Conservative or moderately Radical. The only thing that is clear is that they do not go to extremes on one side or the other. If they are sincerely anxious not to see the Game-laws rudely handled, they would do well to take them in hand. Whenever the Liberals come into power, they will almost certainly be dealt with; and though no Government is likely to go the length of Mr. PETER TAYLOR, it is quite possible that a Liberal Government might not content itself with legislating about hares and rabbits. That they did not support Sir WILLIAM HARCOURT's amendment was reasonable enough. The House of Commons ought not to be committed to immediate legislation on any subject by the accidental success of a rather lame joke.

It is the more extraordinary that the Government should have said nothing about the excessive preservation of ground game, because a passage condemning this practice was introduced into the report of the Committee of 1873 at the instance of a former Conservative Minister. At the suggestion of Mr. WARD HUNT, the Committee declared that that they could not "too strongly repro-"bate the practice of some landlords and their shooting "tenants of keeping up a large stock of hares and rabbits "on cultivated lands to the injury of the crops of the "farming tenants." In the same Committee a proposal to take rabbits out of the Game-laws was carried by eleven votes to seven, while one to treat hares in the same fashion was only rejected by ten votes against eight. It can hardly be maintained that the practice in question has decreased during the seven years which have elapsed since this Report was presented, and the damage done to farmers by its continuance is not likely to be less felt in bad times than it was in good. A practice which has been "reprobated" by a Select Committee of the House of Commons, at the instance of so staunch a Conservative as Mr. WARD HUNT, may fairly be made a subject of legislation when the warning has remained ineffectual for seven years.

The fact that hares and, still more, rabbits are an important element in the national food supply is not one to be forgotten. The Select Committee which reported in 1873 were told that the number of ground game annually produced was thirty millions; and, though Mr. MUNTZ objects to this fact being treated as of any moment, because eight rabbits consume the keep of one sheep, there is an occasional advantage in having something for dinner which is not butcher's meat. If the contents of the national larder were judged upon the principle of excluding everything which was more costly than

mutton, hares and rabbits might not be the only food the production of which would be forbidden for the future. But one of the arguments most constantly used in defence of the Game-laws is calculated incidentally to reassure us upon this point. "If the game," said Sir WALTER BARTTELOT, "were given up to the tenant, he would prove "to be the best gamekeeper"; and we do not see why, if hares and rabbits were given up to the tenant, he would not prove to be at least as active a purveyor of food for the community as the landlord is now.

STRONG LANGUAGE.

IT might seem to require a lifetime to estimate strength of language at its true value. Those who have a past to look back upon are increasingly struck by the recoil of telling utterances—forcible words that once went for so much to themselves—upon the authors of them. The time too often comes when the strongest words, put together with the most deliberate intention by men who knew the meaning of what they said and believed themselves to be saying what they meant, instead of being testimonies to sustained force of conviction, are the most awkward of all witnesses to inconsistency and change, to the power of circumstances and the subtle hidden temptations of self-interest. The speakers perhaps thought that, because the expression was vehement and committed them to a course, they were expressing their whole selves; but we see now that it was only part of them that spoke. Something which is more intimately the man's nature and self has acted in the long run in direct opposition to his most emphatic, sharply-defined, memorable sayings of a past date. This perhaps sounds a mere commonplace. It has been said often enough before now that humanity is weak and unstable, and that people must express themselves according to their nature, and be vehement if that nature is impulsive. But the question is whether the recoil we speak of is mainly due to such inherent weakness and inconstancy; whether some want of simplicity of intention, at the time equally unsuspected by speaker and hearer, the sort of duplicity that haunts rhetorical display, has not more to do with it. It is a great thing for a mind solely absorbed in its subject by the mere force of conviction to condense its meaning into memorable sounding words. The belief must have a strong grasp to dictate such expressions, apart from any solicitude to dress it in felicitous terms; and words thus spoken will stand the wear and tear of life. But in most epigrammatic sayings, political, religious, or personal, sayings that live in men's memories as characteristic of the speaker, there is something which betrays to a matured experience a double action at the moment of utterance, a solicitude to set off the speaker's self to advantage, a care that shared the mind's attention with the subject itself, and led to conscious sacrifice of truth to effect. There are signs of deliberate exaggeration in order to cut a figure, and to illustrate, together with the matter in hand, the wit, readiness, vehemence, and passion on which the speaker was in the habit of valuing himself—all at the cost of absolute sincerity. It is difficult to say what a mind in this mood will not commit itself to in order to condense a judgment into a nutshell, and reduce it to a size and portableness that any memory can carry. A case in point, except that the recoil on the speaker came much sooner than in the ordinary course of events, occurs in a neat trenchant saying of Gibbon's, recorded against him by Charles Fox. The odd volume of the *Decline and Fall* that contained it, when sold under an execution, fetched three guineas—more, we are told, for the memorandum in the handwriting of the owner than for the book itself. It ran thus:—"I received this work from the author. N.B.—I heard him declare at Brooks's, the day after the Rescript of Spain was notified, that nothing could save this country but *six heads* (of certain Ministers whom he named) upon the table. In fourteen days after this anathema he became a Lord of Trade, and has ever since talked out of the House as he has voted in it, the advocate and champion of those Ministers. CHARLES FOX." It was the ambition to live beyond the moment in the memory of his hearers that suggested to the great historian this form for his opinion, for of course no one will suppose that this sanguinary method of epigrammatic censure meant what it said. This, however, is an extreme example.

No doubt epigrammatic language has an educating power. Strong words, well and roundly uttered, impress the young hearer with the sense of a strong presence—which it is a good thing now and then to feel—the presence of a vigorous will, deep convictions, a fearless advocacy of truth, or of what the speaker holds for truth. His words seem to constitute him a permanent exponent and champion of opinion; they mark him as exceptional and distinct. Inexperience cannot help regarding strong words not only as the expression of intense and even original thought, but also as trammels willingly assumed. The man is seen in the act of binding himself, and limiting his choice of action. Every epithet is supposed to be a link in the chain, every round assertion commits him to all futurity. Words fail of their power, and even miss their aim, if they do not do something of all this, and, doing this, they quicken the blood, and set the hearer's thoughts in a train outside of his small personal interests; and yet what words uttered under the mixed motives we have indicated stand the test of time, and do not, in the course of events, rise up against the speaker? There are occasions when strong things need to be said, when moderate men therefore accept the duty of saying them; but it is taking them out of their way; they retire into themselves after saying them. But we speak rather of those with whom the task is self-chosen because it is congenial. A party cannot do without men of this turn, men whose minds adapt themselves instinctively to this method of expression; there is a work for vehement language to do—at least all sides seem to find it so; but people who encourage themselves in it become tools in the process, and suffer the fate of tools in being used up and degenerating in the service. This subsidence into a mere habit of speech, which, as it grows in wordy strength, tells less and less for weight and permanence of conviction, this losing the sense of the value of words, is what saddens observers who can compare a man's present with his past.

Lacordaire, speaking of the rhetoric of the extreme Ultramontane party of his day, describes this degeneracy. "Their style is always the same; full of spleen and outrageous personalities. The whole secret of that style consists in finding out some insult for a substantive and some other insult for an adjective." "Look," he asks again, "at the story of our troubles, and tell me who are those whose memory has remained pure; those only who were never extreme; all others have forfeited the esteem of their country." But here, probably, prejudice would be enough to keep the vituperators in one key. These are not the people who change their note; the recoil we have spoken of does not come from any change in them, but from the change of the world towards them. Nothing tends more to ensure a certain consistency than strong prejudice, which can be forcible to the end without danger of eating its words; the concise verdict recorded of some sturdy Briton by Dr. Johnson, "For anything I see, all foreigners are fools," was not likely to be reversed by time. Consistency of this sort, which can safely indulge in strong utterance, is simple and onesided; larger natures are confronted by another side which holds their tongue in check, or punishes them if they give it license. In this way a man's blind followers are in little danger so long as he himself keeps his ground. As a rule, though not always, the strong language of which we are thinking belongs more to followers than to leaders, to the exponent of another man's views rather than to the originator. If people will recall the occasions on which they have indulged in a strength of language which does not harmonize with their present feeling, they will probably find that it was under the support of another judgment than their own, of opinions taken up, not derived from their inner self. We may note in others that where a man is vehement against his nature, his vehemence of words attaches not to his original bias but to borrowed and adopted opinions; hence a subsequent contradiction, in which we may find more to praise for the candour of recantation than to blame for the inconsistency.

Strong words which do not give expression to the speaker's own thought take the place of action in his mind. We see this whenever party warfare runs high. When action is called for, men moderate the force of their words. It is not only that politicians in office are restrained by motives of policy from the license they allowed themselves in opposition. The temptation to wound with the tongue flags in everybody with the sense of real work. Thus surgeons with this sense of power use a studied mildness of speech. A late eminent practitioner had a favourite phrase, "a little something," which he was wont to apply to some of the most formidable operations of his art. There is a literal sense in which words are weapons on which we need not dwell, except to say that, under the most unveiled ferocity of purpose, we see the same double action of thought—the desire not only to move others, but also to do one's self credit in the manner of moving them. When M. Rochefort (of whom the saying was reported) told a mob of Communists that "society owed but one duty to princes before putting them to death—that of identification," the satisfaction of turning off a neat, terse sentence must have divided the orator's thoughts with his ostensible object.

Our ears are so much more used to the strong language of denunciation than to its opposite that, with many persons, the words suggest nothing else. There is, however, a vehemence of praise which is subject to exactly the same reversal through time and change. People are sometimes so attracted and fascinated by an object which falls in with and supports some view or theory then occupying their minds that, in its presence, impressions of memory are absolutely obliterated; nothing was ever comparable to the thing in hand; it is eulogized in a strain of extravagant panegyric which lives much longer in the memory of the hearer than of him who spoke it, and whose recollection sees it in very different colours. With him it has served its turn. It is very true that some people can only express themselves through hyperbole. Their minds are so little analytical that all minute shades of difference are lost to them. Indolent minds take refuge in it as saving trouble. To say modestly of a thing, says La Bruyère, that it is good or bad, requires good sense and correct expression; *c'est une affaire*. It is much shorter to say decidedly, in a tone that dispenses with proof, it is execrable, it is miraculous. This, of course, goes far to explain the strength of the current social vocabulary. A strong thing, said seriously, ought to cost a man something; it ought to take something out of him; he ought not to say it and forget it. But this seriousness is not incumbent on us always. A lusty hyperbole is admitted to be one of the lurking-places of wit; such sayings, uttered with a jocund courage, are invigorating performances. Even the hearer, who could not—dare not perhaps—say such things himself, when he listens to another pronouncing,

denouncing, vituperating, feels as if he were lifted above the dead level of monotonous life. A character hit off in a short formula of memorable words lives in his mind; though in the end it may tell more against the consistency of the painter than for the truth of his picture. Biographers are often unjust towards their subjects in preserving such utterances. An arrogant saying is left on record, and perhaps lives in the reader's memory when all else fades into indistinctness; such, for example, as the late Mme. Bunsen's summary judgment of the *Heart of Midlothian*—Scott being disparaged in her circle—as "mere book-making."

Perhaps it is no argument against strong words that men cannot always live up to them. The preacher who denounces the holder of another creed from the pulpit and fraternizes with him in private has a line that may be clear to himself, though he perplexes the congregation which he has indoctrinated with his views. We are too complex in our nature and our duties towards one another for our mutual relations to be settled in a few sentences, though these may be true as far as they go, or as true as it was in the nature of the speaker to put them; for it must be observed that the teachers and preachers who make the deepest and most lasting impressions are not the sayers of strong things. They are not tempted to say them, for they can do without them.

THE NAVY ESTIMATES.

It was not to be expected that a Government which has been savagely attacked for extravagance would, on the eve of a dissolution, bring forward large naval Estimates; and perhaps the Lords of the Admiralty deserve credit for not being carried too far by a desire for economy which naturally becomes intense as Parliament approaches its end, and for introducing Estimates which are only a little lower than those for 1879-80. These amounted to 10,586,894*l.*, while those for the coming financial year are 10,492,935*l.*; so that the net decrease is 93,959*l.*, which for the national exchequer is a small sum. It may possibly be thought that the real decrease in the actual cost to the country will be much greater, inasmuch as the expenditure during the current year has largely exceeded the estimates; but this view would not be correct, as the increase has not been due to charges which can be rightly debited to the navy, but to those which were incurred for the conveyance of troops. The sum, therefore, which is demanded for the maintenance of the navy during 1880-81 may be considered as practically the same as that which has been required for the expiring year; and those who have some regard for the efficiency of that service on which the very existence of the country may at any time depend will be glad that the Cabinet has not sought an easy popularity by making a large reduction. Still it is to be observed that, if no exaggerated dread of the hustings has been shown, the wish for apparent economy has exercised a powerful influence, and that, as has been pointed out in the *Times*, the Estimates are now lower than they were during the last year of Mr. Goschen's administration at the Admiralty. Whether the sum now demanded is sufficient, or anything like sufficient, for keeping up such fleets as this country would inevitably require in the event of a great war is, to say the least, doubtful in the extreme; but before considering this question it may be well to draw attention to the leading features of the present statement, and to the singular nature of one of the reductions which are contemplated.

That part of the Estimates which is scanned with the closest attention, and is rightly made the subject of the most careful criticism, is that relating to the ship-building work which is to be executed in the national dockyards or by contract. Here the Estimates show a decrease in charge and an increase in the tons' weight of hull to be built. The total amount demanded for dockyards and naval stores is 2,354,585*l.* against 2,385,000*l.* voted last year, so that the decrease is 30,415*l.* The expenditure on shipbuilding by contract is to be 769,000*l.*, or 73,000*l.* less than what was required for the expiring year. For these sums 12,636 tons' weight of hull are to be built at the dockyards, and 4,310 tons at private yards. Last year the shipbuilding work to be executed at the national dockyards was estimated at 12,151 tons, and the contractors' work was stated at 3,127 tons. On the whole, then, there is an increase in the tonnage to be built, while the expenditure is to be smaller; and, at first sight, this seems satisfactory enough. But all satisfaction vanishes when the detailed account of the shipbuilding work which is to be carried on at the public dockyards is examined. If it is only less by a little than it was last year, that is because the work was comparatively easy, owing to the great exertions which were made when a war with Russia seemed imminent. It is difficult to imagine that any one who has given attention to naval affairs can suppose that the proposed additions to the navy are such as ought to be made when the present strength of foreign naval armaments and the work which our navy would have to do in the event of a war are considered. With regard to the most important vessels in a modern fleet, the ironclads, the list is miserably deficient. Not very long ago we pointed out that this country only possesses four vessels fit for service which can properly be considered as first-class turret ships, three which may be classed as second-rate, five broadside vessels of the first and six of the second rank. This certainly forms no very mighty squadron for such a power as Great Britain, and, seeing what France and Italy are doing, there can hardly be a doubt that our fleet of armoured ships ought to be considerably increased. Very small, however, is the number of ironclad men-of-war to be added to the navy in 1880-81. One of these, the *Inflexible*, is, it is true, a great vessel; but, though her completion is now promised, it has been delayed so long that it may be regarded, like the completion of Cologne Cathedral, as something to be hoped for rather than expected. Begun in 1874, she is, it is said, to be finished some time before March 1881; but very likely when that month comes round she will still be in the hands of the artificers. No other ironclad built at the national dockyards is to be added to the efficient fleet this year; but the *Superb* and *Neptune*, which were bought in 1878, and were generally thought to have been ready long ago, are to have some considerable alterations made in their armaments, while the *Orion*, purchased in the same year, is to be completed. One vessel which may be finished, and three vessels which were supposed to have been finished some time since, scarcely represent such an addition to the navy as Englishmen should desire. With other armoured vessels the work to be done is not more remarkable. The *Agamemnon* and *Ajax* are to be advanced to $\frac{75}{100}$ths and $\frac{68}{100}$ths of completion respectively; the *Polyphemus*—that torpedo-ram of which so much has been said—to $\frac{90}{100}$ths; the *Colossus*, a new steel armour-plated turret-ship, to $\frac{35}{100}$ths; and the *Majestic* and *Conqueror*, two other turret-ships, to $\frac{20}{100}$ths and $\frac{40}{100}$ths of completion respectively. Two new ironclads are to be commenced; but, as no money is allotted to one, and only a very trifling sum to the other, they scarcely belong to the construction of 1880 81. The Estimates, it should be said, do not indicate whether they are to be powerful sea-going vessels or comparatively small ships for coast defence. Very moderate, then, and indeed not a little disappointing, are the undertakings of the Admiralty with regard to armour-plated vessels for the next twelve months. Rather more ambition is shown respecting other ships, as one corvette, one large despatch vessel, four sloops, and fifteen gunboats are to be finished. Even with this portion of the fleet, however, there will be no very active effort, and, on the whole, the proposed additions to the strength of the navy in 1880-81 must be pronounced to be lamentably insufficient when patent facts, which none but Radical orators and Cabinet Ministers eager for economy can ignore, are taken into consideration.

The reduction then on the total sum demanded for shipbuilding and stores is due to an exaggerated economy for which the Government is not perhaps to be severely blamed, but which nevertheless is deeply to be regretted. Most of the other reductions seem unimportant; but there is one which cannot be too strongly condemned. Last year Mr. Smith reduced the number of boys in the Navy by 1,000, and thereby effected a comparatively trifling saving. Now he proposes to reduce the number still further. During the ensuing year there will be 400 less boys than are employed under the reduced estimate of 1879-80, and the country will save their rations, and in wages the gigantic sum of 3,906*l.* A more striking example of unwise and petty saving can hardly be imagined. The boys who are now at work on board vessels of war and training ships will, in due course of time, help to man the navy. It requires now a considerable period to train a man-of-war seaman, and, in the event of a war, the ranks of the navy could no longer be recruited from the merchant service as of old. The men of the Naval Reserve would no doubt be of great use, but they would be far inferior to those who from their youth had been trained on board the Queen's ships. To diminish the number of boys in the wholesale manner that is now proposed is, for the sake of a very small present gain in money, to weaken essentially the fleet of the future, and to cause a deficiency which in time of need cannot be remedied by any possible administrative effort. Strange to say, the diminution made in the number of boys scarcely attracted any notice last year, and though there was some discussion about comparatively trivial questions relating to the Estimates, this unwise reduction passed almost unobserved. It is to be hoped that when the Estimates are discussed this Session some attention will be given to the manner in which the future efficiency of the navy is being endangered for the sake of a saving which would appear inconsiderable to the officials of a private company. There are naval reformers in the House of Commons who are old enough to remember the time when there was very great difficulty in manning the navy, and they can hardly approve of measures which must inevitably cause a recurrence of this difficulty in the event of a war.

The desire for economy which has prompted such a reduction as this, and has also fettered works at the dockyards, cannot but be deeply deplored, for never perhaps in a time of peace has the importance of maintaining a powerful navy been so obvious as it is now. There is the necessity of keeping pace with the navies of foreign Powers, to the great strength of which Sir Spencer Robinson has so opportunely drawn notice; and, in addition to this, a new necessity of the most imperious kind has arisen. As has been pointed out lately by ourselves and by others, the navy would, in a war, have to protect, not only our commerce and our dependencies, but even the very food of the people. We now derive a considerable part of our supplies from America, and it seems not improbable that before long we shall derive a part from Australia. An enemy who could stop the stream of vessels carrying meat and grain would do as much harm as an enemy who could plunder homesteads and stop the cattle and corn traffic on the railways. No attempt to disprove the possibility of such a blow being struck has been made, and we venture to predict that none will be made, as it is but too painfully clear

that an enterprising foe would make a desperate, and perhaps successful, effort to intercept our supplies of food. Some fanatics think, and some dishonest men pretend to think, that this country need never go to war, and these no doubt would find in the probability of such an attack a reason for avoiding hostilities under any circumstances; but none who are rational and honest can doubt that a war may be forced on Great Britain just as a lawsuit may be forced on an equitable and pacific man. Should we become involved in war, a considerable portion of our supplies may be stopped, unless we have a very large and powerful navy; yet, strange to say, the time when this fact has become most apparent is the time chosen for indulging in short-sighted parsimony, and for relaxing the effort to maintain and increase our fleets. For this most unfortunate and inopportune economy, however, it would be hard to hold the Admiralty exclusively responsible. The First Lord may have been very unwise in one of his reductions, and the constructors, in their desire to make the *Inflexible* as perfect as possible, may have kept her too long in hand; but there can be no doubt that, on the whole, the affairs of the Admiralty are well administered, that the money voted is wisely spent, and that, if there is slackness at the dockyards, it is because not nearly enough money is voted to keep them active, and to make such additions as should be made to our fleets.

KEEPING ONE'S CARRIAGE.

AMONG the numerous forms of domestic tyranny which people love to inflict upon themselves there are few greater than that which is sometimes involved in the possession of a carriage. It is no uncommon thing to see men who have spent one half of their lives in longing for this luxury pass the remaining half in a state bordering on utter misery, arising from an almost invincible reluctance to use the very thing for which they have so ardently wished. The motives for this reluctance are somewhat difficult to explain. It does not arise, as a rule, from pure humanity, for many men who will not allow their own horses to be overworked will think nothing of ordering a fly whenever an exceptionally long or arduous journey has to be performed. Nor does it necessarily arise from any wish to deprive one's family or belongings of pleasure or recreation, for where such a wish was possible the carriage would never have been purchased. It is generally due to an exaggerated estimate which all men are more or less prone to form of the value of their own horses, and to a consequent apprehension of the results of too much work in the shape of veterinary surgeons' bills. This feeling, if allowed to grow unchecked by considerations of necessity, seldom fails to attain to a pitch which, as we have already observed, entails little short of actual misery on the proprietor.

Let us suppose the case of a man living in the country who has brought up a tolerably large family on anything but a large income. He has had a somewhat hard struggle, but his principal difficulties are now tided over. His older sons are making their own way in the world, one or two daughters are married, and only a few of the younger children remain under the paternal roof. He finds that advancing years involve an advancing bill for hired conveyance, and why should he not possess his own carriage? It will merely be the actual cost of the horse and the vehicle; for his garden is small, the gardener announces his ability to fulfil the double duty, there is a stable and coach-house standing invitingly empty, and there is a patch of meadow on which the horse can graze. His wife on being consulted gives her cordial approval—more likely than not she had herself put the notion into his head—and the sole question now remaining is as to the description of carriage to be procured. After much hesitation and discussion a brougham is probably determined on as the most suitable for use both by day and night, and for a time all goes well. The formidable arrear of calls which had gradually accumulated is quickly cleared off; dinner parties and dances become more frequent, and every one is highly pleased. Before long, however, a change is perceptible. The gardener or coachman begins to find the night work irksome and to resent it; but he has sufficient sagacity to put his objections on the score of solicitude for the horse, not for himself. The animal, he says, is kept waiting too long in the cold when the carriage is ordered to take up, and, unless this is altered, he cannot be responsible for the consequences. Some slight resistance is perhaps attempted; but the man has got up his case, the master has not, and the former is ready with innumerable instances of horses rendered useless by exposure and sold at a fearful sacrifice, of veterinary surgeons' bills of unheard-of length, and divers others equally potent arguments. The master is silenced, if not convinced, makes the first fatal concession, and gives in. From that hour the family might, as far as pleasure is concerned, almost as well give up going out at all. It is not enough, when they do go to a party, that the carriage is ordered to take them home at an unconscionably early hour; for full ten minutes before it is due the unfortunate owner is fidgeting about, taking furtive peeps through curtains and shutters, and making himself and everybody else generally uncomfortable. In vain do the girls, supported by their mother, plead that the programme is barely half over, that their best dances are yet to come, and that their horse can bear waiting as well as other people's; he is deaf alike to persuasion and argument, and at length the family are fain, for very peace sake, to tear themselves away, almost wishing they had never come. Emboldened by success, the coachman next determines to have a veto put upon going out at night at all, and again he carries his point. He informs his master that the horse is rapidly losing condition, and that it is too delicate to stand night air, in addition to which he hints that when he does go out it is not properly treated. Being asked for explanations on this last point he coolly proceeds to demolish the reputation of all the stables within a radius of ten miles. At Mr. Brown's they are draughty, at Mr. Jones's they are not ventilated at all, at Mr. Robinson's there is nothing but hard water, while at Mr. Smith's they give mouldy hay. The luckless master suspects that the whole thing is unmitigated humbug; he sees that his horse is really in perfect condition; but he can neither reply to the torrent of argument, nor summon moral courage to resist the imposition. So the carriage goes out no more at night, its place being taken by a fly, much to the delight of the young ones, who can now enjoy their parties in peace.

Finding himself master of the situation, the man carries the war a step further and assails one of the most important and useful functions of a carriage—namely, that of going to and from the railway station with visitors or even members of the family. The usual type of argument is once more resorted to. Trains are always late, and the horse has to stand in the cold—an infliction which, we may casually remark, is not shared by the driver if there is a public-house handy. Luggage knocks the carriage about; it is not the kind of work on which a gentleman's carriage ought to be employed; only last week a horse was frightened by a passing express and ran away, smashing a valuable carriage to pieces, and so on *ad libitum*. In the end the functions of the carriage are limited to an occasional afternoon drive for the purpose of shopping or visiting, the drive being performed at the exhilarating rate of about four miles an hour, not including sundry stoppages to rest the horse whenever a gentle gradient, dignified with the name of hill, is safely surmounted, to accomplish which feat the occupants, including the ladies, are made to turn out and drag their dresses over a mile or so of dusty road. Were it not an acknowledged fact that no work is worse for a horse than too much, the animal would simply never leave the stable at all, and the necessity for occasional exercise frequently renders the carriage a positive nuisance. On a certain day Paterfamilias will announce at lunch that the horse has not been out for three days, and requires an airing. The family arrangements for the afternoon have already been made, but must now be given up, and a solemn and uninteresting drive substituted. The next morning brings an unexpected invitation to a picnic or afternoon party at a distance, and application is at once made for the carriage. Not at all; "the horse was out yesterday, and may have to go out again to-morrow," is the reply. If the unfortunate owner is good-natured, a fly is promised; if not, the young people retire discomfited, asking each other, not without reason, what on earth is the use of a carriage which can only be used when they do not want it, and never when they do. As time goes on matters become worse and worse. Formerly it was considered an offence to keep the horse waiting at night; now the objection extends with equal force to the daytime. If any of the family wish to drive out they are requested to state the precise moment at which they want the carriage brought round, and woe betide them if they are not ready to the minute. It matters nothing that the master of the house is not going with them; that he has, in fact, a pressing engagement elsewhere; nothing will induce him to leave the house until he has seen them off, and accordingly he takes his stand in the hall, watch in hand, and keeps up a perpetual worry and fuss. Card-cases, purses, rugs, umbrellas, everything, in fact, likely to be useful, are perforce left behind; the party are bundled into the carriage like cattle into a truck, and then he goes his way rejoicing, because the horse has not been kept waiting.

Another delusion cherished by the victims of this peculiar monomania is a deeply-rooted idea that no one but themselves or their coachmen can manage their horses. The particular animal in question may be as old as Methuselah or as quiet as a lamb, but it makes no difference. It may happen that a grown-up son is on a visit home, and one day offers to take the girls out for a drive. Such an idea cannot, however, be entertained for a moment. Not that the father is ill-natured; on the contrary, he likes to see his young folk enjoy themselves; but he is firmly convinced that, unless he is present, something is sure to go wrong. Accordingly, the most absurd excuses are unblushingly put forward. It is too hot, or too cold; there is going to be a shower; the roads are bad, and not fit for driving; and, in one extreme case, we have known the goodness of the roads pleaded as an excuse for refusing, on the ground that the horse would be sure to be over-driven. As the unhappy man grows older this mania grows stronger and stronger, until the carriage lies idle for five days in the week. In vain is it pointed out to him that the horse of his neighbour the doctor is doing its hundred miles a week and is in perfect condition; that many tradesmen, and notably butchers, work their cattle even harder; he inwardly admits the truth of the reasoning, but cannot bring himself to apply it to his own precious animal. His annual bill for flys has meanwhile gradually mounted up to its old figure, if not even higher; but he can neither bring himself to sell his carriage nor to use it. It remains a dead weight on his hands; and he ends by wishing heartily that he had stuck to hiring, and never bought one at all.

DR. RUSSELL OF MAYNOOTH.

THE death of Dr. Russell, President of Maynooth, removes by far the most distinguished divine, with one notable exception, of the English-speaking Roman Catholic body, the only born member of that body, except the late Cardinal Wiseman, who could be said to stand in the first class of scholars or theologians. Under any other Pope than Pius IX. he would long since have been raised to the episcopate, if not to the Sacred College, and it is highly characteristic of the influence which for many years past has prevailed at the Vatican that a man of some practical shrewdness and the narrowest Ultramontane views, but wholly devoid of any intellectual tastes or distinction, like Cardinal Cullen, should have received the highest honours of his Church, while the greatest living scholar among his Roman Catholic countrymen was persistently kept out in the cold. That Dr. Russell would have been, as was generally reported, the first Irish Cardinal named by the present Pope, we can readily believe. It is said indeed that, but for his failing health, he would have succeeded Dr. Cullen last year as Cardinal Archbishop of Dublin. But that he should never have attained any higher dignity than that of President of Maynooth—for which of course he was eminently qualified, but which he owed not to the authorities of his Church but to the British Government—is after all intelligible enough. That he was himself, like Cardinal Newman, averse to promotion and publicity, and preferred the quiet life of a student and recluse, may be quite true, but that is not the reason why he was never promoted. When we say that he was a man of scholarly mind, and of great and varied learning and intellectual culture, well versed in languages, ecclesiastical history, and patristic literature as well as in theology, the translator of Leibnitz's *Systema Theologicum*, and a contributor to both the *Encyclopædia Britannica* and the *English Encyclopædia*, it is hardly necessary to add that he was very far from being an Ultramontane. It is true that at one time he was associated with Dr., afterwards Cardinal, Wiseman in the conduct of the *Dublin Review*; but in those days Dr. Wiseman, who was himself a scholar and a man of learning, affected a broad and moderate line, and professed a warm admiration of Lamennais and even of Dr. Arnold. It was before the great reaction had set in at Rome, and the Tractarian converts had taught their English co-religionists that purity of Catholic doctrine was to be measured by its extremest divergence from every form, and especially from the Anglican form, of Protestantism. Dr. Russell was not, in fact, at all the kind of man whom the late Pope delighted to honour, nor would he have proved a suitable instrument for the work entrusted to Dr. Cullen of Romanizing the Irish priesthood. That his influence in moulding the successive generations of candidates for the priesthood placed under his care at Maynooth has not left more perceptible traces may be partly due to that very width and refinement of intellectual cultivation which most of them were little capable of appreciating. The endowment of Maynooth, whether a wise measure or not on other grounds, had the indirect but inevitable effect of lowering rather than raising the social and intellectual status of the Irish Roman Catholic clergy. Before that time many of them used to receive their education abroad, which implied that their parents were in a position to make some outlay upon it, and where moreover their mental horizon was likely to be enlarged by new associations. But a free education, with an assured position but small and precarious income afterwards, has naturally attracted the youth of the peasant class and sons of small tradesmen, who now compose the bulk of the Irish priesthood. It is not, however, for this reason alone that Dr. Russell has, to all appearance, failed to leave his mark upon them as a body. The influence of Rome, and those who represented the mind of Rome in Ireland, was against him. On this, however, we shall have a word to say presently.

To many of our readers Dr. Russell's name may be chiefly known, or chiefly interesting, from his connexion with the religious career of Cardinal Newman. To speak indeed, as some of the papers have done, and as is implied in the *Times'* obituary, of his principal claim to remembrance being "the direct authorship of the conversion of John Henry Newman to the Roman Catholic Church," is simply absurd. That result was due, as every one who is even moderately acquainted with the works of the eminent convert must be well aware, to his own solitary study and meditations, and not to any personal influences from without. What he says of Dr. Russell in the *Apologia* is that "he had, perhaps, more to do with my conversion *than any one else*"—which is quite another thing; he repeats again and again how little anybody had to do with it, and how studiously he held aloof from personal intercourse with Roman Catholics to the last. What happened was this—that in the summer of 1841 Dr. Russell, in passing through Oxford, called on Mr. Newman at Oriel, who took him over some of the University buildings; and again another summer he called on him on his way from Dublin to London. "I do not recollect," adds the author, "that he said a word on the subject of religion on either occasion." It was in fact to this studious abstention from all attempts at proselytizing that he owed whatever influence he may have exercised over Dr. Newman's mind. "He sent me at different times several letters; he was always gentle, mild, unobtrusive, uncontroversial. *He let me alone.*" We may observe in passing that it is by the same method of letting them alone to follow out their own convictions that Dr. Newman himself has won over such recruits as his personal influence has attracted to the Roman Church—a method very unlike that of another distinguished convert, who is fond of hurrying proselytes over the Rubicon after half an hour's conversation, sometimes to find them two or three days later recross the stream uttering anything but benedictions on him and his cause. Dr. Russell's letters no doubt helped to remove some anti-Roman prepossessions from the mind of the future Cardinal, though they cannot with any accuracy be said to have "resulted in his determination to join the Roman Church." He also gave Mr. Newman one or two books, which served the same purpose, and it is worth noting what they were. One was a volume of Liguori's sermons, without any references to "Mariolatry"—and there are whole volumes of his sermons which might be preached with much edification from an Evangelical pulpit—and another was "Veron's Rule of Faith." The selection of this last by Dr. Russell is very significant. Our readers may possibly recollect that we had occasion to refer to it the other day in connexion with the Roman doctrine of communication, and it is constantly quoted in a curious work published early in the last century, *Proposal for Catholic Communion by a Minister of the Church of England*, noticed at some length in our columns three years ago, and which has since been reprinted in accordance with a suggestion we then ventured to make, and under the title prefixed to our article of *An Eirenicon of the Eighteenth Century*. And it is frequently quoted there precisely because it presents Roman doctrine in its most moderate and conciliatory form. Veron was a Gallican divine of the first half of the seventeenth century, who disclaims Papal infallibility and autocracy, and so treats the doctrine of the Mass and the Sacraments that a well-known Anglican controversialist of the Oxford movement, Sir W. Palmer, says he has no material fault to find with his teaching on these points. We fear Veron would be considered little better than a heretic by modern Ultramontanes, but it was his *Regula Fidei* which Dr. Russell presented to Mr. Newman, and it held formerly such high authority in Ireland that Archbishop Murray cited it before a Committee of the House of Commons as the most authentic exposition of Catholic doctrine. It is a brief and admirably lucid treatise, and we observe that it is mentioned in the *Apologia* without a word of censure. Such then was the nature and extent of Dr. Russell's intercourse with Mr. Newman at Oxford, which afterwards, when the latter was called to preside over the so-called Catholic University of Dublin, ripened into a warm and lasting friendship.

We have already explained why Dr. Russell so little succeeded in infusing into the general body of the Irish priesthood the *mitis sapientia* characteristic of his own gentle and cultivated mind. Cardinal Cullen, who was an active and conscientious prelate, did something no doubt towards taming the rowdyism of the "surpliced ruffians"—as the *Times* used to call them—whose aggressive nationalism was apt to be a good deal more conspicuous than their devotion to Catholic interests. That was part of the special work he was sent from Rome to effect, but he did it not by elevating their standard of mental culture so much as by imposing a rigid system of Roman drill, and reforms of that sort cannot touch the root of the evil—they are too skin-deep to endure. At this moment numbers of Irish priests are popularly reputed to be Fenians; not of course that they actually belong to a secret Society under the ban of their Church, but that their sympathies are with the party it represents. We heard only the other day of an Irish country gentleman, who is not only a devout and exemplary Roman Catholic, but a model landlord, residing on his property and devoting himself heart and soul to the interest of his tenants, being "denounced from the altar" in three different churches. The fact is that the spread of education is loosening the old traditional hold of the priesthood over the masses, which was partly based on mere habit or superstition, and as they have not qualified themselves to reclaim their influence on higher grounds, they are constrained too often to clutch at a fresh lease of power by throwing themselves once more into the stream of popular agitation. With such revolutionary courses Rome can never have any sympathy, and Cardinal Cullen was placed at Dublin to check them. But neither could those who exemplified in their own lives a nobler ideal and might have trained their brethren to better things—men like Dr. Russell and Bishop Moriarty—command the confidence of Rome. Bishop Doyle in the last generation, Bishop Moriarty and Dr. Russell in our own day, represented a type of higher ecclesiastical dignitaries which the Roman Catholic Church is fast losing, and can ill afford to lose, not only in Ireland but elsewhere. In Italy it is almost extinct; in France it barely survived the fall of the Gallican Church; the Syllabus and the Vatican Council are killing it out in Germany. Throughout the long pontificate of Pius IX. the Curia waged an internecine warfare with a spirit which was in the Church but not of it, as they understood the matter, and in the persons of Dr. Döllinger and his allies they hoped to have cast it out. Leo XIII. is differently minded, but it remains to be seen how far he will be able to arrest the fatal results of a policy so long and so studiously identified with the whole framework of ecclesiastical government, and which received its apotheosis in decrees which it may prove equally inconvenient to enforce or to disclaim. What Dr. Russell, who used to make Veron's *Regula Fidei* his textbook, thought of Papal infallibility we are never likely to hear. But it can hardly have caused less embarrassment to him than to the late Bishop Haneberg, who assured Dr. Döllinger that after again going over the whole historical argument he could find no support for it in the traditions of the Church, but finally acquiesced on the desperate

plea that perhaps the Church might require a new doctrine to meet the emergencies of the present age. The standing tradition of the Irish Roman Catholic Church was directly opposed to the doctrine, and the most widely known catechism, composed by an Irish priest and disseminated under episcopal sanction over the length and breadth of the country, denounced it as "a Protestant invention," fathered on Catholics by the ignorance or malice of their assailants. Dr. Russell must have been familiar with Keenan's Catechism from his youth, and would probably have appealed to it as freely as to Veron's manual up to July 1870. It must have been a bitter humiliation to him in his later years to feel that either his Church had changed her faith, or he had all his life been wrong on a point which concerns the very foundations of Christian belief. Meanwhile in him his country has lost a man looked up to by all who had the advantage of knowing him, whether members of his own communion or others, not merely as a kindly and dignified ecclesiastic and a learned professor, but as a typical example of a gentleman, a scholar, and a divine.

ABOO ROWASH.

EVERY traveller, even the least adventurous, likes to visit places unvisited by other travellers. Ladies like to be "the only lady who ever ascended" some mountain, or "the only lady who ever descended" into some cavern. People of experience in the ways of guide-book writers frequently hit upon such places by finding them labelled as "not worth the trouble," or "not worth the fatigue," of a visit. Among the excursions from Cairo, Aboo Rowash shares this fate. The writers of the handbooks and tourists who describe their adventures on the Nile can never have ascended to the strange pyramid which is perched on the top of this mountain, or they would not say, as most of them do, that it presents little of interest. The excursion is very easily made. There are no Arabs to mob you, as at the great pyramids. You can sit in solitude on the nameless ruins, and eat your sandwich without a dozen spectators watching every morsel with hungry eyes. And this year, when the Boolak Museum is closed for repair and rearrangement, and when Cairo is already noisy with preparations for the Prophet's birthday, and the streets crowded with processions singing to welcome the pilgrims from Mecca, it is pleasant to escape for a time with a sympathetic companion or two and try for ourselves whether there is nothing to see on the mountain. We have often looked at it from afar. It is conspicuous from Gheezeh, a high, white, flat-topped precipice—how high we cannot tell from a distance, but evidently much higher than the rocky platform on which the Great Pyramid stands. It is difficult to believe that any very large building can exist in such an inaccessible situation; yet, looking from the plain, we can just descry a cairn of some kind on the very summit. Aboo Rowash is, in truth, the highest of the Libyan chain which borders the cultivated land on the west—the highest, that is, of the mountains visible from the river, between the Delta and the Fyoom. It may rise as much as four hundred feet above the plain, and the face towards the river is a sheer cliff of remarkable, almost chalky, whiteness. The green Delta comes close up to it on the north. The yellow desert stretches in wide sandy slopes to the south. Behind it to the west is the unknown land of dark rocks and trackless wastes which the ancients, who saw the sun depart thither each evening, called Amenti, the hidden abode of the dead.

We first make for the great pyramids along the avenue of acacias which the late Khedive constructed in 1868 for the visit of the Prince and Princess of Wales. The Arabs who see us approaching are disappointed when we turn our donkeys' heads northward and leave the road with only a glance at the pyramids. It is a long way, they tell us, to Aboo Rowash; there is nothing to be seen there, they assert; but when we question them particularly, we soon ascertain that not one of them has ever ascended the mountain, or knows what is on the top. Continuing our course along the edge of the desert, and only stopping here and there to pick up specimens of the beautiful little flowers which grow in the sandy turf, we reach at length, after an hour's further ride, a valley which leads up towards the cliff. The sand is deep, yet a torrent seems, from the marks it has left, to have occasionally, if not often, run its brief course through the defile, which, becoming gradually narrower and more rocky, reminds those of us who have been at Thebes of the approach to the tombs of the Kings. At length we have to alight, and desiring our attendants to take the donkeys on to the point at which we propose to descend, we apply ourselves to climbing. A little way up we diverge to the right to visit a cave. It is a mere cleft in the rock, but when we peer into the darkness beyond, we discover that it extends some yards into the face of the rock. There is a black smoky look about the entrance which answers well to the horrible memories of the place. Here, no long time ago, the slave-trading Arabs used to come with their caravans, and in that hideous hole used to store their human merchandise. The blackness is caused by smoke; for here, it is said, on one occasion, if not oftener, a fire has been lighted to force some unhappy slave to come forth from the inner recesses, in which he—perhaps she—had endeavoured to hide.

Turning away with a shudder, we ascend a steep ridge of black rocks by a series of natural steps. Soon we are at the level of the summit of the white cliff on our right. Its face is marked by the fall from above of great blocks of limestone, which have come down in a cascade and lie in heaps of *débris* below. Thus it is that the buildings which the ancient kings had been at such pains to raise on the plateau were gradually dilapidated by modern marauders too lazy to quarry for themselves. Once on the top, we encounter, at the southern edge, what may have been a pyramid, but is now only a square of two or three courses of cut stone, stone so much disintegrated that few traces of cutting remain. Beyond it is another, rather higher, but still more difficult to recognise as anything but natural rock. To the right, and almost at the edge of the cliff, is the largest and least ruined of the remains, standing out on the rocky promontory by itself. It is flat-topped, only five or six courses of masonry in height, the core of natural rock appearing here and there behind the casing of squared limestone. All round it a series of heaps of red granite, like satellites round a planet, show where the members of the household were buried near the last resting-place of the Pharaoh whom they had served in life. Most, if not all, of them have been dug out, yet we do not hear that any discoveries have been made tending to identify the pyramid. Merely to judge by its time-worn appearance, it may be older than the oldest of which we know the age. The top is easily gained, and then we see that a great rock has been squared, faced with stone blocks externally, and hollowed out within. The entrance is to the north, and in a few moments we can descend from block to block, until we stand in the centre of the chamber. The passage to it is cut in the living rock, like the chamber itself. Both have been lined with stone of a finer quality, and the mortar adheres still to the rough-hewn walls. How they were roofed, seeing that the passage is some ten feet wide, and the chamber fifteen by forty, cannot now be known. Pharaoh's grave is rifled. Nothing but this great pit is left, with the long passage which leads into it, to show where he rested, and whether the whole structure was surmounted by a pyramid. Such a pyramid on such a height would indeed be a conspicuous feature in the landscape, and would be visible many miles away in the Delta. The wonder is how stones from the Mokattem mountains on the opposite side of the Nile, and great boulders of syenite from the cataract 600 miles away to the southward, could have been transported to the top of the cliff. A kind of causeway may be traced nearly a mile down the steep incline to the north, itself a cyclopean work. The choice of this great hill, the fact that the causeway leads away from Memphis, the rude character of the masonry, the distance between this and the continuous pyramid-field of Gheezeh, Sakkara, and Dashoor, seem to be reasons for assigning Aboo Rowash to a different period from other pyramids, perhaps an earlier, but more likely a later period. Another puzzling fact may be found in a curious mound of broken crockery which lies immediately to the east between the pyramid and the precipice. We often read on the monuments of the Old Monarchy that so many jars of wine, so many of incense, so many of honey, were offered at the tomb. Sometimes these offerings are called innumerable. If this mound is the site of the temple attached to the pyramid, it may be that all these broken vases and drinking cups were used in the worship of the deceased king. Among them we find some hammers of hard stone, either the relics of the actual pyramid-builders, the implements with which they chipped those mighty masses of granite, or else the rude tools with which some barbarian horde, perhaps from beyond the desert, broke up the masonry when they hurled the squared blocks of the casing over the cliff. "Perhaps and perhaps" are, after all, the words most frequently on the lips when we try to account for the phenomena presented by such a place, and the mind of the visitor, perplexed and baffled at every turn, finds a satisfaction in leaving the pyramid to look at the view.

It has the advantage over the view from the top of the Great Pyramid of including the whole of the principal pyramids, with the exception of Maydoom. In the foreground are the mighty cairns of Shoofoo and Chafra, hiding the smaller buildings of the Gheezeh group. Behind them we see, though further off, the stepped pyramid of Sakkara, surrounded by many a mouldering heap, the ruins of other pyramids and tombs and temples without number. Beyond these, again, are the giant forms of the two great pyramids of Dashoor, one of which, the most distant, has lately been identified as the probable monument of a king of the fifth dynasty. Dashoor is full twenty miles from Aboo Rowash; but the pyramids there, being only smaller than the two greatest pyramids of Gheezeh, are plainly visible from such a height as this. Then we turn eastward. Below us is the saint's tomb which gives the Arab name to the mountain, looking like a bee-hive among bushes, but really a good-sized dome surrounded by lofty trees. Next comes a long belt of dark palms, looking almost black by contrast with the intense green of the land beyond and between them and the distant river. The Nile looks cold and white from where we stand; but all the green fields are intersected by canals of the deepest blue, here and there the mounds and minarets of a village showing beside the pools and among the palms. In the far distance is the Mokattem range, bounding the valley on the east, and at its feet Cairo half hidden in its smoky haze, though we can make out the dome of Sultan Hassan, and the heavy mass of the citadel above. On the hither side of the river is the late Khedive's vast "folly"—the so-called park and palace of Gheezeh—a whitewashed, rambling barrack, standing in a marsh of newly-reclaimed land. Nearer still, besides the palaces of some junior members of the family, all vastly out of proportion

to the rank and importance of the owner, we are shown one house which looks modest enough. Here lives Ismail's widowed daughter; and it was here that, during the money troubles of last year, her Highness's affectionate father called one day and took away with him, in spite of her opposition, a coffer containing some twelve thousand sovereigns which her husband had laid by as an endowment for his orphan. So runs the story; and there is, unfortunately, little reason to doubt its substantial truth. It is one of an immense crop of similar legends which were supposed to be secrets before the present Viceroy's accession. We turn with pleasure towards the north, and away from the palaces. In this direction the view is most extensive, but most featureless. The Delta stretches away interminably, as if from our very feet; a wilderness of green fields, blue water, dark trees, and brown villages, without a hill to catch or rest the eye. We see the point where the Nile divides, and the canal that supplies Suez. In the middle distance are the towers of the Barrage, a vast unfinished dam intended for the regulation of the water supply, and still seen with horror by the fellah, who believes it to be an abortive contrivance for taxing his water and imposing forced labour. What a happy valley it might be but for its Government, we cannot help exclaiming, as a corollary to the proposition that so rich a view can hardly exist elsewhere on earth. Then, marking out our route towards Cairo as on a map, among the villages and fields below us, we descend and take our winding way home, better pleased with Aboo Rowash than we expected. The road is intricate, and, though as the crow flies only about two-thirds as long as that round by the pyramids, occupies a longer time.

MR. GRISSELL IN NEWGATE.

THE enterprising person who created such an excitement in the last, and what might have been expected to be the dullest, days of the Session of 1879, is in Newgate, and there can be little doubt that he is in his proper place there. Sir Stafford Northcote is nothing if not a merciful man, and he proved on Tuesday night that the quality of mercy can sometimes be strained. Mr. Grissell, it must be remembered, is an offender of a very complex kind. His original offence was sufficiently black; and, if offences are to be judged by their tendency to do public harm, it merited in itself a very severe punishment. But this original offence was aggravated by conduct which an assembly, even if it had not the traditions of the House of Commons, could not possibly overlook. By absconding on a transparently false pretext, and perhaps still more by giving himself up to justice when it was a foregone conclusion that justice could do little or nothing to him, he did all that lay in his power to make a farce of the whole proceeding. Finally, though no proper indemnity covered his various misdemeanors, he allowed several weeks of the new Session to pass without even going through the formality of making a submission. For all these things it seemed good to the Chancellor of the Exchequer that Mr. Grissell should be brought to the bar and reprimanded. The proceeding might have been for the moment imposing, especially if the traditional practice of making the culprit go on his knees had been followed. But, though the reprimand might be unpleasant to a man of honour and spirit, it could hardly in these days be considered likely to deter the particular persons who are most likely to imitate Mr. Grissell's various delinquencies. Accordingly, protests arose from the most diverse quarters of the House against this limitation of the penalty, and Sir Stafford Northcote had to give way. Perhaps, in some respects, it was better that the penalty should be a genuine expression of the will of the House itself than that it should be prescribed by the Government; but this is the only excuse that can be made for a proposal which was certainly inadequate.

According to Mr. Walpole's account, the culprit appears almost to the last moment to have been still under the highly erroneous idea that the whole thing was more or less of a joke. It is probable that the short debate on Tuesday night and his own prompt arrest may have undeceived Mr. Grissell. His demeanour when on Wednesday afternoon he was brought to the bar—an actual material bar arranged for such purposes—was humble enough, and his apology likewise. It could indeed hardly be other than a lame apology. It was complimentary to the newspaper press, no doubt, that Mr. Grissell should attribute to a paragraph in the *Times* the quenching of his desire to make submission somewhat less tardily than he actually did. But as the *Times* is not, as far as we know, the accredited organ of the House of Commons, the excuse must be pronounced more ingenious than satisfactory. The sentence which followed this little scene illustrated the curious traditional differences which exist between the practices and powers of the two Houses, and nearly all of which have historical and constitutional explanations. Ignorant people had gone about saying that Mr. Grissell would be committed to durance of some kind or other for a week or fortnight, or longer. Had his offence been an offence against the Upper House this might have been the case. But here, as in other cases, we see the broad distinction between the two Houses, the one possessing and the other not possessing the character and powers of an ordinary court of justice. The House of Commons can avenge itself by committing an offender, but it cannot so far arrogate judicial powers as to sentence him to imprisonment for any specified time. He is committed, and that is all; but he is not released until Parliament rises in virtue of a prorogation or dissolution, unless some special motion is made in his favour. Mr. Grissell might have been incarcerated like his unfortunate solicitor in the Clock Tower, but the House preferred to send him to Newgate. Though not the most dignified, nor in some respects the most comfortable, residence of the two, the establishment in the Old Bailey has its advantages from the point of view of the prisoner. There is no Big Ben in Newgate, and Mr. Grissell may therefore sleep undisturbed by the vibration which had such intense effect on his much less culpable partner in guilt. Probably his cell will be less spacious, its furniture less abundant, and its appliances generally less thoughtfully considered than would have been the case with the Westminster apartment. But it is whispered, though not many people have had an opportunity of knowing by experience, that the House, or rather its prison, is a decidedly expensive hotel for those who sojourn there against their will. Two centuries ago Milton and the Serjeant-at-arms had a little dispute about fees, which shows that the same complaint existed then; and indeed there is no particular reason why the tariff should be as "strictly moderate" as hotel-keepers by profession assure us is the case with theirs. The galley is a galley in which no well-meaning or well-doing person has any business whatever, and those who find their way there are, in our day at least, not at all likely to deserve much compassion from outsiders. The House of Commons, as this case abundantly shows, is rather too slow than too hasty in punishing aggressors, and when they are punished they are likely to get less, not more, than their deserts.

This being the case, it is allowable, without incurring the charge of vindictiveness, to hope that Mr. Grissell will not be allowed to quit his present sojourn too soon. The Easter holidays being only an adjournment, not a prorogation, would not necessarily come to his relief, though it is not improbable that the House, which is placable enough nowadays, may consider them a fitting occasion for pardon. Something less than a month's imprisonment can hardly be considered too heavy a punishment for gross and repeated offences against the public good and the dignity of the House of Commons. It cannot be doubted that in a few days we shall hear of Mr. Grissell's health being affected. It has been historically proved to be extremely delicate. And, indeed, it is somewhat remarkable with what unanimity the health of educated criminals, especially when they undergo milder forms of punishment than the common run of prisoners, is wont to give way. We do not know whether, among the varied directions in which Mr. Grissell has turned his powers, literary industry holds a place. Of late years it has served the turn of more than one such captive to relate, in his most affecting manner, the secrets of the prison-house. Mr. Grissell, indeed, is at a disadvantage—or, from another point of view, an advantage—compared to Silvio Pellico and other historians of the dungeon. His life as a first-class misdemeanant—which position it may be supposed he will hold—may be somewhat monotonous, indeed nearly as much so as that of a hard-worked professional man whose office happens to be in his own house. He will not, for some time at any rate, be able to take those trips to Boulogne which are so necessary to his "sanitation," as the current scientific slang has it. But in other respects his sufferings are not likely to be acute. He may join one of those curious Mutual Improvement Societies where the members are bound to read books of a strictly edifying character for so many hours every day. It is even to be believed that no obstruction would be thrown in his way if he devoted himself to the most unedifying of literature, and sent messengers three times a day to Mr. Mudie's for novels, or backed himself to read all the minor poetry of the month. As he seems to be what our ancestors used to call a projector, and what we by a slight change of word and meaning call a promoter, he may profitably employ himself in devising new projects and new methods of promoting them, methods, let us hope, which this time will not lead him to Newgate. Seclusion of such a kind may not seem a very terrible punishment for what is in all seriousness a very serious offence. But, on the whole, the genuine testimony of those who have experienced it seems to be unanimous to the effect that imprisonment is not pleasant. It is extremely rare for an Englishman who has not committed a crime, and who is of full age, to be prevented—actually prevented by *force majeure*—from doing what he chooses. He may virtually be enslaved pretty closely by professional duties, but these he can break through if he chooses to take the consequences. This is not the case with Mr. Grissell. He cannot "put his hat upon his head and walk into the Strand," or rather into Newgate Street, and there is every reason to believe that the knowledge of this must be annoying. There is, indeed, poetical authority to the effect that bolts, and bars, and windows, and such-like apparatus do not make a prison. But we are inclined to think that they do, with all respect to Lovelace. Since most of us were boys we have not experienced the "absolute shall" which, especially when assisted by bolts and bars and warders, amounts to a total loss of personal liberty. Therefore, if anybody thinks that Mr. Grissell's punishment is altogether futile, he is probably wrong. But at the same time it should not be too short. It is in many cases a capital thing to look at passing events in the light of a joke; but the line must be drawn somewhere. Mr. Grissell's idea of jocularity is peculiar; and he seems to cling to it with singular pertinacity. His original attempt, whether seriously meant, or only intended to impose on third parties, seemed to him (when it had failed) to be a joke of which it was absurd for the House of Commons to take notice. The mandate of the House for his arrest was a joke; hobnobbing with the messenger at Boulogne was an excellent joke; surrender-

ing at the fag end of the Session was the best joke of all. It was perhaps natural that, imagining the House to have taken the same view, he should have thought it unnecessary to revive the old jest in the present Session. Newgate is an excellent place for reflection. Prisoners are proverbially said to cool their heels in such places; but it is probable that the cooling effect on the head is, in most cases at least, equally remarkable. In a few weeks' detention Mr. Grissell will be able to reconsider his theory of jokes, and to adjust it with greater delicacy to the actual condition of things in this world. There have been times when he would by no means have got off so easily. Nobody wishes to recur to the practices of those times; to which, however, Mr. Grissell's original offence was decidedly better suited than to the manners and customs of the present day. But it is just as well that a warning should be given to would-be imitators, and if the matter had remained where it was some days ago, it cannot be said that the warning would have been a very serious one. As it is, all that we and the public generally have now to do with Mr. Grissell is to wish him a happy, but not too speedy, release, and a conversion during his sojourn from the errors of his preceding ways. Charity and justice may thus be mingled in a sufficiently exact proportion.

INCREASE OF EMIGRATION.

THE Report on Emigration and Immigration which has just been issued by the Statistical Department of the Board of Trade shows that there was a considerable increase last year in the number of persons who left this country for places outside of Europe. During the long depression of trade there had been a great falling-off in emigration and a great increase in immigration; so that in 1876 the difference between the two—that is, the net loss of population—amounted to no more than 38,065; in 1877 the loss was still further reduced to 31,305. It will be understood, of course, that we are speaking only of persons of British or Irish birth. It will be seen that two years ago immigration, practically speaking, balanced emigration, a loss of 31,000 in a year out of a population of 34 millions being undeserving of notice. But in 1878 a change set in. In that year the number of emigrants of British and Irish birth was 112,902, while the number of immigrants was only 54,944; the excess of emigrants over immigrants was thus 57,958. Last year there was a still further increase in the number of emigrants, which was 164,274; and there was a still further decrease in the number of immigrants, which was only 37,936. Therefore, the net loss of population last year rose to 126,338, being more than twice the net loss in 1878, and more than four times the net loss in 1877. It may be assumed, that, as a general rule, emigrants go out as steerage passengers. Of course a certain proportion, belonging to the better classes, pay for a cabin passage, but the vast majority of those who leave this country for other lands in search of fortune have not the means of doing so. It is important to note, therefore, as additional evidence of the renewed growth of emigration, that it is among steerage passengers that the increase has taken place. For instance, the number of cabin passengers has risen only from 37,147 in 1877 to 43,928 last year, while the number of steerage passengers has risen in the same interval from 82,824 to 173,235, that is, has more than doubled. Again, as bearing on the same point, we may observe that "the general labourers" who went away in 1877 were only 9,816, but last year were as many as 28,504; that is, were nearly trebled. The "miners and quarrymen" in 1877 were only 1,428, and last year were 3,933, and the "farmers" had risen from 2,477 in 1877, to 5,382 last year; in these last figures we have a reminder of the severity of the agricultural distress.

At first sight it may seem strange that emigration, which was so large during the inflation years that followed the Franco-German war, should have continued to fall off throughout the period of depression that succeeded, and should begin to increase again just as the depression was drawing to an end. But a little consideration will show us, we think, that in reality the fluctuations were perfectly natural, and might have been foreseen by any one who had given thought to the subject. As we have often pointed out in these columns, the peculiarity of the depression through which we have so long been passing is that it took its rise in the raw-material-producing countries. It began with a panic in Vienna in May 1873, and was intensified by the panic in New York in the September following. In the United States the ruin was general and severe. Banks, mills, and forges were closed all over the Union, the making of railways was stopped, and for a while almost all industry was prostrated. Crowds of workpeople were thrown out of employment, and all the great cities were visited by a real distress. Here, in England, we had only a pale reflex of what was suffered on the other side of the Atlantic. We had no panic, and until the autumn of 1878 we can scarcely be said to have had many serious failures. The iron, the coal, and the cotton industries, no doubt, were in a state of collapse; but the general prosperity of the country was not severely diminished until a succession of bad harvests came to aggravate the falling-off in the purchasing power of our foreign customers. Even at the worst, however, we experienced nothing like the distress felt in the United States for a couple of years after the New York panic. It was, therefore, the most natural thing in the world that emigration from this country to the United States should go on decreasing year by year, and that immigration from the United States to the United Kingdom should go on increasing. And it is equally natural that when a succession of abundant harvests restored prosperity to the United States, emigration thither should recommence. And this is precisely what has happened. Of the whole addition of 69,000 to the net emigration of last year, 51,000 is to the United States, 10,000 to British North America, and only 8,000 to all other places.

It is suggested by Mr. Giffen, the author of the Report on which we are commenting, that a decrease of emigration is not a peculiarity of the late depression, but, on the contrary, occurs in all periods of bad trade. The statistics seem to bear out the suggestion, although, unfortunately, the record of immigration is of too recent a date to throw any light upon the subject, Mr. Giffen himself having been the first to recognize its value. But it is difficult to conceive why emigration should, as a rule, so fall off. In the late depression, as we have just seen, there were special reasons accounting for the decrease. But periods of bad trade are not always more severely felt in the raw-material-producing than in the manufacturing countries, and when they are not so, or rather when the reverse is the case, it is natural to expect that emigration should be stimulated. It is true, of course, that wages fall in times of depression, and employment becomes scarce, and that, in consequence, the working classes have not as much money as in more prosperous years. What, therefore, Mr. Giffen calls "tentative" emigration would naturally be checked, while many of those who desire to leave the country would want the means of doing so. This would account for a certain falling off, and it would also account for a considerable increase as soon as trade began to revive. People who had been pinched by being thrown out of work would avail themselves of their first earnings to go to some country with more openings for mere labour. But the point cannot be adequately discussed without taking into consideration the circumstances of the countries to which emigrants go, as well as those of the country which they leave; and among these circumstances we would include the political as well as the economical. For example, there was a great falling off in the emigration to the United States both in 1861 and 1862; but the three previous years had also seen a much diminished emigration, though not nearly to so great an extent as in 1861 and 1862; and there was a sudden increase in 1863. Was, then, the continued decline in 1861 and 1862 merely the effect of the depression beginning in 1857? Or was it caused by the outbreak of the Civil War? The sudden increase in 1863 would seem to prevent our ascribing much influence to the Civil War, and yet it is difficult to believe that the working classes in Europe were not affected by fear of the conscription. Again, we notice a considerable falling off in emigration in 1855. How far was that influenced by the Crimean war? But without dwelling further upon this part of the subject, we may note that the statistics do undoubtedly show a decrease of emigration in former periods of depression as well as in that through which we have just passed. It will be interesting, then, to observe whether, supposing the revival of trade to prove permanent, the increase of emigration will also continue. The people of this country are sufficiently educated to appreciate the importance of not overcrowding the labour market, and they have a natural taste for adventure. The close balance between emigration and immigration which we have seen in 1877 proves with what facility they move from country to country, and what a small margin of advantage induces them to cross the Atlantic. It would seem not improbable, therefore, should trade improve so as to bring back again the high wages of 1873, that large numbers may go abroad for the purpose of determining for themselves whether England or America offers the better home to a working man, intending to come back again should the experiment be in favour of this country. If this happens, we shall have a substantial reason for that falling off of emigration in periods of depression which we noticed above. On the other hand, it is certain that the remuneration of labour in England and the United States has for some time been so closely approximating that the inducement to a skilled workman to break up his home and go abroad is now much less than it formerly was. It is not impossible, therefore, that the increase of emigration, though continuing, may be at a slower rate than in past periods of prosperity.

There is one other point deserving of notice; it is that, in spite of the distress in Ireland, the increase of emigration from that island is not more rapid than from Great Britain. Just as happened in the case of the whole United Kingdom, the emigration from Ireland fell off through the late depression. In 1873 the Irish emigrants numbered 83,692; they decreased through the following years, until in 1877 they did not exceed 22,831; they then began to increase, and last year amounted to 41,296—barely half the numbers of 1873, and just the numbers of 1875. Moreover, while in the three years 1853-55 the Irish emigrants constituted 61 per cent. of the total that left the United Kingdom for places outside Europe, and even so late as 1871-75 formed 34 per cent. of the total, last year they were no more than 25 per cent. How far this decrease in Irish emigration is attributable to the poverty of the Irish people, and how far to the impression made upon them by the consequences of the New York panic, there are, of course, no means of determining. But it is to be borne in mind that the poverty now existing is not comparable to that of the famine years, when the exodus assumed such enormous proportions. Moreover, it is an honourable characteristic of the poorer classes in Ireland that the members of a family

who are doing well abroad send home to the friends they have left behind them the means of following in their steps. It is hardly probable, therefore, that inability to find the passage money stops any large number. On the other hand, the communications between the Irish in the United States and the Irish at home are close and constant; and it is not improbable that the stories of the distress that prevailed in the winter of 1873-74 may have made a great impression on them. But the full effects of the late severe winter upon the course of emigration will not be known for another twelve months. In comparison with the amount of the population, however, the emigration from Ireland even now is greater than that from the rest of the United Kingdom. While the population of England and Wales is about four times that of Ireland, the number of English and Welsh emigrants last year was not 2½ times the Irish—104,275 against 41,296. Thus it is only relatively to its former immense proportions that the Irish emigration now seems small. In reality it is very large when we take into consideration the amount of the population. The emigration from Ireland as well as that from Great Britain is mainly to the United States. The emigration to other places is comparatively insignificant, and does not fluctuate at all to the same extent with the condition of trade. It would seem, therefore, to be self-supporting, since it varies with the means of the emigrating classes, and also with the degree of attraction which the new countries have for them.

THE THEATRES.

THE production at the Imperial (Afternoon) Theatre of *As You Like It* is among the most satisfactory of recent theatrical events. The play has been put on the stage with excellent taste and discretion, and the company engaged in its representation is, on the whole, remarkably good. The scenery, by Mr. Perkins, has much beauty, especially the Forest of Arden scene; and it does not appear to us that either the stage arrangements or the dresses, admirably designed by Mr. Forbes-Robertson, are over-elaborate. It has been suggested that the banished Duke and his court would hardly present so spruce an appearance as that in which we see them; but it seems to us that to indicate the wear-and-tear to which a forest life would expose them would be to push realism too far. One might as well insist on Macbeth making his first appearance in a war-worn and travel-stained condition. Granted that costume and stage arrangements are important illustrations to the play, then surely it is desirable to produce with them as generally correct and as pleasant an impression as possible, without making them so obtrusively gorgeous as to distract the attention or descending to sordid particularities which have no real value. This, as it seems to us, Miss Litton has succeeded in doing. To come, however, to what is more important than these matters, the acting of the piece.

The performances of Miss Litton as Rosalind and of Mr. Kyrle Bellew as Orlando cannot but add to their reputations. We do not know if Miss Litton has ever before appeared in a Shakspearian part on the London stage. As Rosalind she displays a keen perception, great technical skill, and a power, which is not too common, of speaking blank verse as it should be spoken. It might perhaps be said that generally Miss Litton is not at her best in the more tender passages of the part; but it must be added that her rendering of the scene where Rosalind, half swooning at the tale of Orlando's wound, begs Oliver to commend her "counterfeiting" to his brother, is excellent. Among many things which are very good in conception and execution, special commendation may be given to Miss Litton's scene with Silvius and Phœbe, and to the delivery of the epilogue. Miss Litton wears a boy's disguise (and her disguise as Ganymede is original and admirably designed) with a better grace than any actress we have ever seen except Mme. Trebelli; and the scenes between Ganymede and Orlando are, it appears to us, given in exactly the right tone and spirit by both the players concerned in them. Anything like real tenderness on Orlando's part to Ganymede would surely be far out of place. One touch, at the end of the principal scene between them, where Orlando is really moved for a moment by the disguised Rosalind's tears, and on her changing them to mockery goes off half laughing, half vexed at himself, is particularly well given. Mr. Bellew is throughout picturesque and manly; he can be tender and impassioned when those qualities are needed, and he speaks his lines excellently. He has to a great extent got rid of a certain restlessness which has before been observed in his acting; but his exits reminded us more than once of M. Mounet-Sully's trick of leaving the stage as if he had suddenly recollected that it was eleven o'clock and that he was late for a most important appointment. Both Mr. Bellew and Mr. Allbrook, who plays Charles, go through the wrestling scene with capital effect. Mr. Hermann Vezin's Jacques is already known to many playgoers. He delivers all his words, and notably the famous speech, with consummate skill, and one need only question whether Jacques was in truth so seriously melancholy a personage as Mr. Vezin makes him seem. Mr. Brough's performance of Touchstone has much humour without descending to caricature. Mr. Farren's Adam is a well-considered and skilful, if dry, piece of acting. The other characters are, on the whole, well filled, and special praise may be given to Miss S. Hodson and Mr. Bannister for their playing of Audrey and William. The glees and madrigals are well sung, and Mr. Coventry gives Amiens's songs with a pleasant voice, and occasionally with a good method.

Mr. Edgar Bruce has opened his management of the Prince of Wales's Theatre with the production of Messrs. Grove and Merivale's play *Forget-Me-Not*, which, it may be remembered, was brought out in the off-season last year at the Lyceum, and which has since then been played with success in America. On its first production we gave a full description of the piece, which turns upon a certain article, or rather upon two articles, of the Code Napoléon, which give an adventuress a hold over an innocent girl, on whom they enable her to impose her presence for a definite time. The girl's sister has married the adventuress's son, and, as he has not complied with the provisions of the Code, it rests with Stéphanie de Mohrivart, the adventuress, to make the marriage legal or null and void. This the girl, Alice Verney, is bent on keeping from her sister's knowledge, and it is only if by their help she can regain a place in the society from which she has been outlawed that Stéphanie will refrain from annulling the marriage. The main action resolves itself into a struggle, of which the interest hardly flags for a moment, between Stéphanie and Sir Horace Welby, a rich Englishman, who is in love with Alice, and bent on saving her from the clutches of Forget-Me-Not, as Stéphanie is called. It has been thought by some that the motive of the play is hardly strong enough; but, in fact, there are few stronger passions than that inspired by the desire of a woman, well born and accomplished, to get back within the pale of a society from which her misdeeds have banished her. Nor could anything well be stronger than the resolve of such a man as Sir Horace Welby to save the girl he loves from the influence of such a woman as Stéphanie. The fault, or one of the faults, of the piece is that the struggle is, in one scene at least, too protracted. This is the scene between Stéphanie and Sir Horace in the second act, which is abnormally long, and should either be cut, broken up, or played quicker. Another fault is the introduction, by way of a comic character, of an Italian prince, who is the only person in a society of mixed nationalities who speaks broken English, and yet another is the finale to the play, which seems contrived merely to give Miss Geneviève Ward (Stéphanie) an opportunity for an effective exit. Matters should be so arranged that it should appear impossible to get her safe out of the house without the strange device of telling the man whose vengeance she dreads to turn his back. As things are now managed the situation seems strained. With these reservations we see no reason, on a second hearing, to change the high opinion which we formerly expressed of Messrs. Merivale and Grove's striking and original play, and of Miss Ward's fine and strong performance of the chief character. In some ways, indeed, Miss Ward's performance has gained by experience; but she makes a curious blunder in the scene already referred to. When she has made her appeal for pity to Sir Horace, and had it rejected, she turns on him with certain words which make him exclaim, "She-devil, you drop your mask at last!"—to which she replies with the bitterest scorn of him. For some inexplicable reason, Miss Ward, instead of making at this point the sudden change which seems indicated by Sir Horace's words, keeps up the half-hysterical tone of the preceding speeches, and thus makes her adversary's speeches sound absurd. At one point—the sudden breakdown of her courage when Sir Horace produces his last weapon against her—the actress is even finer than before. Even so practised and skilful an actor as Mr. Clayton is at some disadvantage in assuming a part which was so admirably played before as Sir Horace Welby was by Mr. Forbes-Robertson. Mr. Clayton did not at first seem quite to have made up his mind what to do with the part; but no doubt by this time he has mastered it. Mr. Flockton gives a singular intensity to the part of Barrato.

Since the preceding remarks were written the *Times* has come out with a second criticism of *Forget-Me-Not*. In the course of it the critic gives a curious proof of his wisdom and experience. "The grounds on which the battle (between Sir Horace and Stéphanie) is fought," he says, do not seem on either side of sufficient weight to "an English judgment"—that is, to the judgment of the *Times'* critic. Because, to his judgment, the motive (the strength of which we have already pointed out) is weak, therefore a doubt, for which he candidly admits "there may be no foundation," occurs to the critic's mind whether, as he ingeniously puts it, "despite the obvious originality of much of the execution, there has not been some French influence at work, perhaps insensibly, on the design. . . . There is nothing in the play that would strike a French audience as unpractical or unreasonable." There is, as a matter of fact, no such subtle and mysterious difference as is here suggested between a French and an English audience, and the doubt as to the "French influence" has been answered in a letter to the *Times* by Mr. Grove, who, thinking that "silence might be misconstrued," has recorded that "the play owes nothing to any French or other source, and that, such as it is, it was entirely devised and written by Mr. Herman Merivale and myself."

At the Olympic Mr. J. S. Clarke is appearing in *Red Tape* and *The Heir-at-Law*, and delighting great part of his audiences by employing the same grimaces and intonations in different characters and in different situations. Certainly Mr. Clarke does sometimes make one laugh against one's judgment. The revival of *The Heir-at-Law* has another interest for those who have watched the career of one of the most promising of our young actors. In the difficult and not very grateful part of Dick Dowlas, Mr. Carton, especially in the unnatural and unpleasant

scene with Zekiel Homespun, which he makes as little unpleasant as may be, gives evidence of possessing a strength which his previous performances have hardly shown.

A contrast to Mr. Clarke's somewhat monotonous fooling is found in Mr. Toole's welcome reappearance at the Folly, where, pending the production of a new piece, he has been acting three of his favourite parts—Simmons in the *Spitalfields Weaver*, Buzfuz in *Bardell* v. *Pickwick*, and Puddicombe in *Our Clerks*.

We may take this opportunity of calling attention to the exhibition at 168 New Bond Street of a "Dramatic Fine Art Gallery," which is interesting, both as showing the skill in drawing and painting possessed by certain living players, and as containing various dramatic portraits of historical value.

REVIEWS.

RUSSIA AND ENGLAND.*

THE lady who describes herself by the letters O. K. makes no secret of her real name, as she states that she is a sister of General Kiréeff; but it is perhaps courteous to accept the designation which appears on the title-page. In a short introduction Mr. Froude recommends "this excellent book" to the attention of his countrymen. He is fully justified in remarking that no foreigner who has written in the English language has shown more effective command of it. "O. K. plays with our most complicated idioms, and turns and twists and points her sarcasms with a skill which many an accomplished English authoress might despair of imitating." Exception may be taken to the further statement that, "far from bearing us ill will, she desires nothing so much as a hearty alliance between her country and ours." Whether national friendship is likely to be promoted by skilful turning, twisting, and pointing of envenomed sarcasms is a question with which Mr. Froude has apparently not concerned himself. Three years ago he introduced to English readers a short book or pamphlet by the same writer, which is incorporated in the present work. It was observed at the time that there was perhaps some indiscretion in publishing an angry and irritating invective against England by a Russian writer, at a time when slight causes might possibly have produced a rupture between the two countries. Now that the strain is temporarily relaxed, there is less objection to the process of twisting and turning and pointing unfriendly sarcasms. Mr. Froude is not pledged to all the charges against his own country which form a great part of O. K.'s excellent book; but, if he was consulted, he might have advantageously advised his friend not to republish from her former pamphlet sneers such as that England "secretly strangles murderers in the recesses of her gaols." Educated Englishmen know that the privacy of executions was introduced some years ago in the interest of public morality; and that abundant precautions are taken against any abuses which might result from undue secresy. A lady who only wished to point a sarcasm may readily be excused for an unjust insinuation. In a dispassionate argument, and still more in a persuasive remonstrance, it would have been desirable to avoid the use of the invidious phrases of "Russophobe" and "Turcophil." The assumption that opponents of Russian aggrandizement are affected by habitual terror of one nation or by prejudiced devotion to another is neither conciliatory nor well founded. It would be equally inexpedient to attribute the converse feeling to the Russians; but O. K. has reproduced from her pamphlet a singular disquisition on the reason "why the Russians hate the Turks." The answer is even more surprising than the question. It seems that the Russians hate the Turks because in the thirteenth century they were conquered by the Tartars. The foreign dominion lasted only two hundred years, but "so late as 1571 Moscow was burnt to the ground by a wandering horde of Asiatics." "The Tartars taught the Russian people what the rule of the Asiatic is—a dreadful lesson, creating that inextinguishable hatred of the Turk which will ultimately secure his ejection from Europe. The death-warrant of the Ottoman was signed by Timour the Tartar." One of the most famous exploits of Timour was the victory of Angora over the Ottoman Sultan Bajazet, who, according to a disputed tradition, was afterwards carried about by the conqueror in an iron cage. The subsequent decline of the Mongol power left room for the revival and aggrandizement of the Ottoman Empire. Bajazet can scarcely have anticipated that the remote descendants of himself and his countrymen should be held responsible for the exploits of his victorious enemy. It would be interesting to learn whether Mr. Froude thinks either that avowed hatred of a foreign nation justifies aggressive war, or that the Turks of the present day can be justly punished for the alleged misdeeds of an alien potentate six hundred years ago. The historical excuse for animosity is as inconsistent with fact as it is absurd in theory. Long after the days of Timour the Russians and Turks were united by a common jealousy of the Tartar Khans of the Crimea. The English, who were never conquered by the Tartars, can scarcely be expected to share that inextinguishable hatred which is to secure the ejection of the Turks from Europe. When more territory is wanted the same excuse would serve for their expulsion from Asiatic Turkey. In other parts of the book O. K. dilates on the pacific inclinations of the Emperor Alexander, and on his anxiety to avoid the war into which he was, according to her version of events, ultimately forced. Perhaps the Emperor is exempt from that inextinguishable hatred which his subjects feel for their unfortunate neighbours. It is permissible to entertain some suspicion of a policy which is avowedly founded on hereditary hatred. The small English party, including Mr. Froude, which urgently recommended co-operation with Russia, would have obtained still fewer proselytes if it had consciously abetted the inextinguishable hatred of one country for another. The Bulgarian outrages furnished to the orators of St. James's Hall, though not to O. K., a more plausible pretext for intervention than the conquests of Timour.

Against some drawbacks attending feminine participation in political controversy may be set off the advantage of a candid expression of genuine antipathies. O. K. is a much abler disputant than the generality of men; but the sarcastic outbursts which express her real feelings are sometimes more instructive than her deliberate statements. As it would not be advisable to proclaim inextinguishable hatred to all neighbouring Powers, O. K. denies in formal terms that Russians regard Austro-Hungary with animosity; but the temptation to offer an affront in the repudiation of dislike is irresistible. "There can be no national hatred between Russians and Austrians, because there are no Austrians." "With the Slavs of Austria and Hungary—that is, with the majority of the subjects of the Hapsburgs—the Slavs of Russia can only have the liveliest feelings of sympathy and fraternity." In the same manner the American Fenians had the liveliest feelings of sympathy and fraternity for Irish enemies of the English connexion. The Germans of Austria and Styria, the Magyars, the Poles of Galicia, and even the loyal Croatians and Czechs, are virtually informed by O. K. that Russian intrigues will be directed in the future as in the past to the disruption of a great and ancient monarchy, and to the humiliation of the most civilized portion of its subjects. In other passages it is said that Austria is detested with a hatred which is probably inextinguishable. In that country, as in Turkey, professed sympathies of race are supposed to justify foreign conspiracy against established order. In another part of the book O. K. disclaims on the part of Russia any menace to Austria. She is probably familiar with the work in which General Fadaieeff, a well-known member of her party, contends that Austria must be destroyed as the first step to the conquest of Turkey. On this point, as in other parts of her argument, O. K. quotes, as might be expected, congenial sentiments expressed by English Liberal orators and writers. "Mr. Gladstone in March 1878 referred to the long catalogue of Austria's misdeeds, 'scarcely relieved by a solitary act done on behalf of justice and freedom.'" A former Prime Minister of England who may be Prime Minister again committed a gross indiscretion in publicly insulting a great European Power, which is also one of the most ancient allies of England. The heroic struggles of Austria against Napoleon were undertaken in defence of justice and freedom. The greatest injustice perpetrated in modern times by the Austrian Government was the suppression by armed force of the Hungarian Constitution. The triumph of despotism over freedom was accomplished by the aid of "the Emperor Nicholas, *preux chevalier* in all his feelings, a sincere ally of his allies." It is true that Nicholas was consistent in his hatred of liberty. According to O. K., "he was devoted to his country; he was proud of her, he upheld her dignity with all his power, and he followed without hesitation wherever his duty led." The Emperor Nicholas has never been charged with want of patriotism, which, in a despot of his type, is almost indistinguishable from egotism. He followed when his supposed duty to himself led in more than one questionable direction. It was his duty, according to his interpretation, to practise frightful oppression in Poland, to interfere on behalf of revolutionary wrong in Hungary, to crush freedom, education, and internal improvement at home, and, finally, to entail great misfortunes on his country by a wanton and unprovoked attack upon Turkey. As the Slavonic sentiment had not then been invented, he picked a quarrel with the Porte in the form of a ridiculous squabble about the keys of the Church of the Sepulchre at Jerusalem. O. K.'s admiration of his character is perfectly natural; but the expression of her feeling might have been judiciously omitted in an appeal to the judgment and sympathies of Englishmen.

The substance of the book consists in an eloquent vindication of the Panslavonic movement which has its centre at Moscow. The author is a close friend of Mr. Aksakoff and of his chief political allies; and the sister of Kiréeff, the first Russian volunteer who fell in the Servian war, may well be excused for enthusiasm in a cause which is nevertheless without foundation in justice, while it is dangerous to the peace of Europe. As late as the time of the Crimean war the ethnological doctrine which the Slavonic agitators proclaim was unknown, except perhaps to a few students. When it was necessary to find a pretext for interfering in the Turkish provinces, Eastern orthodoxy was represented as the bond of union not only with Bulgarians, but with Greeks. The philological connexion of the various dialects of the Slavonic tongue was artificially converted into a political relation, though the Polish Slavs were systematically persecuted and oppressed, and though the Germans of the Baltic provinces would have been held guilty of treason if they had sought the protection of Prussia. The ethnological theory was the more convenient

* *Russia and England, from 1876 to 1880: a Protest and an Appeal.* By O. K., Author of "Is Russia Wrong?" London: Longmans & Co. 1880.

because it applied to the Roman Catholics of Bohemia, as well as to the races which adhered to the Eastern Church. A wholly factitious enthusiasm gradually became more or less sincere; but from its first beginning to the present day the Russian Slavonic movement has included a large element of lawless ambition. There is no reason to doubt the accuracy of O. K.'s account of the methods by which the party of aggression forced the Emperor into war. If it is right and expedient that a great Power should interfere on behalf of any foreign population which speaks a dialect of its own language, and if such a policy is indisputably conducive to the interests of Russia, O. K. has produced an effectual apology for the late war, and for similar enterprises to be proximately undertaken. Her assumption, sometimes tacit and more often explicit, that the enterprise was righteous, proves with equal force that, in partially opposing it, the English Government and nation were wholly in the wrong. The writer does not conceal from herself the all but complete unanimity of English opinion on the aggressive policy of Russia; and she not unnaturally regrets the apparent conversion of Mr. Gladstone himself to the national belief. It has for some time past been one of his favourite charges against the Government that its measures have resulted in the triumph and aggrandizement of the adversary with whom Mr. Gladstone had been erroneously thought to sympathize. One of his pamphlets, under the title of "The Friends and Foes of Russia," contained an argument to prove that the Liberals had a better claim than the Government to the credit of having counteracted Russian designs. It is not surprising that O. K., who quotes many denunciations of anti-Russian policy from Mr. Gladstone's letters and speeches, should complain that he also ranges himself among the alarmists and the sceptics. A foreigner may be excused for failing to appreciate the temptations of party controversy. The supposed prejudices of constituencies must account for Mr. Gladstone's protest against the transfer of Bessarabia from a nominally constitutional State to an absolute monarchy. A Russian advocate of the Panslavonic doctrine is perfectly consistent in regarding annexation to the Russian Empire as an advantage and a duty. O. K. makes no mention of Prince Tcherkassky, though, as the confidential associate of Aksakoff, he was probably one of her political friends. The anarchical tyranny of his administration of Poland formed his title to the office of organizing Bulgaria. In the interval between his two missions he took occasion publicly to denounce the claim of the Poles to independent existence. The Slavonic party has systematically assailed the national organization of Livonia and Esthonia, and it regards with unconcealed jealousy the constitutional rights of Finland. With its efforts to break up the Austrian monarchy O. K. openly sympathizes. Between English traditions and Slavonic aspirations there would be nothing in common, even if it could be seriously believed that a fantastic theory, invented in the present generation, was unconnected with the policy which had on other pretexts been followed by Russia for more than a century. Many Russians and friends of Russia regard the agitation which is promoted by the Slavonic party as one of the chief causes of disaffection and general disorganization. Vague excitement never confines itself to a single channel; and, when external aggression is for the time checked, some of its advocates substitute revolution for conquest. The party of which O. K. is a powerful supporter is indeed loyal to the Emperor; but it has made him responsible in the popular judgment for the partial failure of its schemes. The author of *Russia Before and After the War*, a Russian subject and a German of the Baltic Provinces, holds that there is a close connexion between the Nihilists and the Slavonic agitation:—"What Aksakoff and his friends called the broadening of Russia into Slavonic nationality and the acquisition of new forms of life meant, in the eyes of the Nihilists, merely the collapse of all existing systems, the beginning of the end so long striven for by the revolutionary parties in Russia and Europe." The same writer maintains that the danger is only to be counteracted by the assertion of the right of England to be consulted in the affairs of Europe.

On the subject of Afghanistan and Central Asia O. K. agrees on all points with the Duke of Argyll, who has, indeed, stated the case for Russia against England with a fulness which leaves his clients little to desire. She also quotes the admissions of Lord Beaconsfield and of other statesmen of the same opinions that there is room in Asia for Russia and for England. Her desire to promote friendly and sympathetic relations between the two Powers must be accepted as sincere; but unfortunately O. K. is not the only interpreter of Russian designs. Although she appears to believe that the invasion of India has neither been contemplated nor desired, Russian journals are incessantly occupied with projects of a conquest which they affect to regard as an enterprise of liberation. The plans of campaign which are believed to have been prepared at the time of the Russian mission to Cabul may not justify remonstrance, as there was then a probability of war; but, if they were deemed to be practicable, the risk of invasion cannot be disregarded as chimerical. No reasonable Englishman wishes for hostile relations with Russia. If designs on India were frankly and fairly abandoned, the establishment of Russian power in Central Asia would be regarded with genuine good will. No one seriously believes that there is any converse danger of English interference with the Russian dominions. The overtures of friendship with which O. K. concludes her able and remarkable work may be cordially, but conditionally, accepted.

BUNBURY'S HISTORY OF ANCIENT GEOGRAPHY.*

(First Notice.)

MR. BUNBURY is fully justified in saying that the want of such a work as that which he has written has been felt by classical scholars; and we may say without reservation that his purpose in writing it has been worthily achieved. He has undertaken a toilsome task which necessarily carries him many times over the same ground, and he is fully aware that the method which he has adopted lays him open in greater or less degree to a charge of repetition. But he has worked not so much for the few who may read his book systematically from beginning to end as for the larger number who may resort to it for exact information on the state of ancient geographical knowledge in reference to particular countries, or in relation to special historical events and incidents. That the book appears now rather than at an earlier time is in every way a gain. During the lifetime of the present generation the amount of geographical knowledge has been vastly increased. Many problems which had defied the efforts of explorers have received a final solution, and perhaps there is not a single disputed point on which some light, to say the least, has not been thrown by recent investigations. The works of Mannert, Ukert, and Forbiger belong to the earlier half of the present century; and that of Forbiger, the most recent of the three, is loaded with huge lists of names which are far from adding to its attractions. Nor can it be said that the excellent *Dictionary of Geography* edited by Dr. Smith at all answers the purpose which Mr. Bunbury has set before himself in the preparation of these three volumes. It is one thing to bring together all the information to be gleaned from ancient writers about particular places and countries, and to present this information in the exact form which the methods of modern geographical science have rendered practicable; and quite another to trace the conceptions of these countries or places as they were presented to the minds of the ancient geographers. The truth is that in such a work as the *Dictionary of Geography* these conceptions are made to pass through an alembic which in all cases modifies, and in many changes altogether, their real character. The reader may study each article carefully; but he does so with a map before him which exhibits the region in question in the light shed upon it by geographical researches extended down to his own time. He cannot rid himself completely of the impressions thus made on his mind; and often, perhaps, he makes no effort to do so. If the statement of the ancient writer tallies with the results of recent observation and inquiry, it is assumed that the idea in the mind of that writer was the same as that which would present itself to the mind of the modern geographer. The result is a subtle and perhaps unconscious worship of the map as an eternal institution, a worship not greatly disturbed by the remembrance of the changes which the map is undergoing at all times. With us these changes relate commonly to points of detail; and any new information with regard to spots insufficiently known, or even not known at all, immediately finds its proper place, and in no way dislocates the arrangements of the map generally.

To suppose that this was the case with the Greek and Roman geographers is to stray as wide of the facts as it is possible to do. It is well to know the exact position of Arbela or Gymnias, Palibothra or Barygaza, and the exact configuration of the regions to which they belong; but we shall not approach to a knowledge of the idea of those places or countries as they were present to the mind of Xenophon, or Arrian, or Strabo, unless we keep constantly before us the conditions under which their ideas and their knowledge were obtained. We have in truth to realize the very natural and necessary fact that these conditions must in the earliest ages have been simply those of blank ignorance. At first no one knew anything except about his own place of abode or about such neighbouring parts as he had himself visited. In course of time he would learn something more from strangers whom purposes of barter or war might bring into contact with him; and, so far as the methods available during ages long subsequent to the rise of contemporary history are concerned, there is practically nothing more to be said. The geographical knowledge of the pre-Christian centuries was either derived from the reports of merchants or was the result of military expeditions. Explorations for the special purpose of gaining new information, or rectifying prevalent errors or misconception, were unknown; and even when, from the days of Eratosthenes onwards, the geography of the ancient world assumed a scientific form, the distinction between the more recent and the earlier geographers was much more apparent than real. Ideas of a scientific geography the successors of Eratosthenes certainly had; but their efforts to realize them often ended in worse confusion. They knew what ought to be done, and they knew what they needed in order to accomplish the work—a store, namely, of mathematically exact observations. But this mathematical accuracy was just what was beyond their reach. There were very few places about the position of which they could obtain exact reports; and an error as to the relative position of two or three cities, or the direction of a line of coast, had its result often in the distortion of the shape of a whole continent.

The conclusion is, that the works of ancient geographers, and the geographical statements of historians, are to be taken with extreme wariness and caution. Nor is it too much to say that they are

* *A History of Ancient Geography among the Greeks and Romans, from the earliest Ages till the Fall of the Roman Empire.* By E. H. Bunbury, F.R.G.S. 2 vols. London: Murray. 1879.

never to be regarded with absolute confidence, and that besides the modern map, we ought to have the map of the country as it was present to the mind of the historian or geographer whose works we are studying. We are all familiar with the "Orbis veteribus notus" which accompanies most school atlases; and the map of the world according to Herodotus is also pretty generally known by sight. But it is commonly regarded as little better than a curiosity, to be looked at and put aside. A comparison of his map with those of later writers is seldom or never thought of, and yet these not only show what each writer knew, or supposed that he knew, of the countries with which he was dealing, but exhibit the growth of geographical knowledge as the ages rolled away. This growth is of the strangest sort, the advance being sometimes by great leaps, while at others we have singular oscillations, some of which bring about errors or delusions more serious than those of earlier periods. It cannot be said, therefore, that the growth of geographical knowledge was continuous, and still less that anything deserving the name of knowledge is to be looked for in the epical literature which quickened the historical instinct of later ages. The bearing of these remarks on a multitude of speculations relating to the geography of the ancient world is obvious. Unless they can be refuted, no room is left for the decision of any geographical question on the mere weight of statements made by any ancient authorities. The blow falls not merely on the poems which we now receive as Homeric, not merely on the assertions of Herodotus, or Thucydides, or Xenophon, but even on scientific astronomers like Hipparchus, and systematic geographers like Strabo. Not one of these had any adequate guarantees against mistakes and blunders of the most serious kind; and in some respects the men of science were rather worse off than those who made little or no pretension to it.

This is the keynote of Mr. Bunbury's work; and, as the systematic working out of this position is its chief characteristic, so we believe that, by the fulness and exactness with which he has accomplished this task, he has done the highest service, and deserves the gratitude not only of geographical students, but of all scholars whose researches trench on the description of the earth, of its productions, and of its inhabitants. The superstitious veneration paid to ancient poets especially has been a source of the most serious mischief; and its effects are not much counteracted by such works as the *Dictionary of Geography*, although their value is admittedly great. At the outset Mr. Bunbury enters a protest against the undue weight attached to the words of ancient writers:—

> Instead of at once drawing the line, as would be done without hesitation in the case of a mediæval writer, between what was accurate and trustworthy and what was vague and inaccurate, the most fanciful suggestions have been made and ingenious theories invented to account for what was simply erroneous. Even the supposition of vast physical changes has been introduced or adopted rather than acknowledge that Herodotus or Strabo can have made a mistake.

His object therefore has been chiefly to determine how far ancient writers were right in their geographical descriptions, and how far they were wrong, and to pass sentence against them without hesitation whenever their words are palpably opposed to facts which must have been in their days what they are in our own.

This task is by no means so easy as many may be disposed to think it. We often import into the study of ancient writers a mass of prepossessions derived from the experience of more recent ages, and even cautious readers may do so with profound unconsciousness. The Iliad and Odyssey are poems which mention a great many names of places and countries, with some of which the poet was beyond all doubt personally familiar. We have no warrant for assuming that he had this acquaintance with all the spots or regions of which he gives us a detailed description. He relates, further, some military expeditions and voyages to distant lands. We are still less justified in taking up the narrative with the notion that he had in his mind with regard to these any definite geographical system. The course to be followed by us is clear. We have to confine our attention, as Mr. Bunbury insists, "as entirely as possible to the words of the poet himself and the conclusions that may be legitimately drawn from his own language." This was the position laid down by Mr. Gladstone; but unfortunately he did not adhere to his rule, and his examination of these poems yielded little more than a plentiful crop of paradox. We are met at starting by the fact that the poets of the Iliad and Odyssey had no words for the points of the compass. They speak of Darkness, and of the direction or quarter of the Dawn and the Sun; but the vagueness with which these terms are used has led many, and not in recent times only, to suppose that by the former the North was meant, and by the latter the South. The theory falls to the ground at once, inasmuch as in these phrases the dawn is invariably associated with the sun. Mr. Gladstone argues that they must be taken definitely to mean the South-east and the North-west, and then uses them systematically with this meaning, for which, of course, there is simply no evidence whatever. Strabo, it is true, speaks of Homer as the founder of scientific geography; but we have only to take the indications of place as given, for instance, in the voyages of Odysseus, to see the uselessness of looking for a geographical system where none ever existed. The land of the Cyclopes has been supposed to be Sicily. Yet it is certain, Mr. Bunbury remarks, that there is nothing in the Odyssey to lead to that conclusion:—

> There is no indication either of the distance or of the direction of the voyage from the land of the Lotus-eaters thither; and it is scarcely necessary to add that neither the name of Sicily nor that of Ætna is found in Homer. . . . To this it must be added that Homer elsewhere speaks of an island called Thrinakia, which has been almost universally identified with Sicily; and not only is there nothing to connect this with the land of the Cyclopes, but the two appear in the mind of the poet to have been entirely separate.

From the island of Æolus, of which we are told only that it lay a long way to the west of Ithaca, the wanderer goes to the land of the Læstrygones. Six days and nights of hard rowing are spent on the voyage; but nothing is said as to the direction in which they were moving. For the voyage from the city of Lamos to the island of Kirke or Circe we have no indication even of time. The attempt to identify this spot with the Italian promontory of Circeii, which is not an island at all, Mr. Bunbury justly speaks of as absurd; adding that it is "equally impossible to attempt any other determination of an island of which nothing is told us that is not on the face of it purely fabulous." The difficulties are not lessened when we come to the names of well-known places. The group of islands which includes Kephallenia is headed by one for which no representative can be found, and this island is, strangely enough, mentioned in the catalogue of ships in the Iliad as one which contributed forty ships for the war, while Kephallenia, Ithaca, and Zakynthos together furnished only twelve. The efforts to meet the difficulty are only evasions. Colonel Leake tried to satisfy himself with the thought that "there is no proof in the Iliad or Odyssey that Dulichium, although at the head of an insular confederacy, was itself an island." There is none in the Iliad; but the place is mentioned thrice in the Odyssey, and in each instance we are expressly told that it was an island. There is absolutely no room for doubt when we read the lines

> ὅσσοι γὰρ νήσοισιν ἐπικρατέουσιν ἄριστοι·
> Δουλιχίῳ τε Σάμῃ τε καὶ ὑλήεντι Ζακύνθῳ,

and no room, therefore, for the notion, which Mr. Gladstone eagerly adopts, that the three islands were in fact two, Dulichium and Same being names for different portions of Kephallenia. The only indication of sailing by the stars is found in the Odyssey, where the nymph Calypso tells the wanderer that, in order to reach the Phaiakian land, he must keep the constellation of the Great Bear steadily on his left hand: or, in other words, that he must sail from west to east. But this, seemingly, will not suit any of the hypotheses with which geographers wish to make it fit. Some, therefore, interpret it to mean the north-east, others the south-east, while Mr. Gladstone, admitting that, if the words are taken in their natural sense, they are fatal to his whole fabric of Homeric geography, argues that the phrase, ἐπ' ἀριστερὰ χειρὸς, means not "on his left hand," but "on his right." On this Mr. Bunbury trenchantly remarks, "Among all the subtle attempts that have been made from the days of the Alexandrian critics to our own to explain away the poet's meaning when it did not suit their purpose, it would be difficult to find a more ingenious piece of special pleading than the elaborate excursus in which Mr. Gladstone attempts to support this strange paradox." It is perhaps enough to say that the phrase, although it does not occur elsewhere in the Iliad or Odyssey, is used by Apollonius Rhodius in its usual sense, although it is not easy to see what would be gained even if we had a definite indication of direction for a land which, when it is reached, is manifestly a Nephelokokkygia.

With the Argonautic expedition Mr. Bunbury deals, as we might expect, much more summarily. The details which impart to the voyage from the Symplegades to Colchis the character of a geographical treatise are the additions or inventions of comparatively late years, and the Orphic Argonautica must be assigned to a time subsequent to the first century of the Christian era. In the Odyssey the story of the Argonauts is connected chiefly with the dangers of the rocks called Planctæ; and the poet places these rocks between the shoals of the Seirens and the whirlpools of Skylla and Charybdis, which were generally connected with the western parts of the Mediterranean. It is easy to say that the Planctæ and the Symplegades were two names for the same object; but this was not at all the idea of the Homeric poet, nor is anything gained, as Mr. Bunbury urges, by the attempt "to combine into one narrative stories originally quite unconnected with one another, and to give a definite form to what the earliest poets and their hearers were contented to leave wholly vague and unsubstantial."

It is unnecessary to go through the remaining details to be found in the geography of the Iliad and the Odyssey, in the Homeric hymns, or the dramas of Æschylus, and scarcely necessary to say that the idea of their resting on any geographical system has been effectually disposed of by Mr. Bunbury. But it is never satisfactory that a question should be cast aside as insoluble; and in a special degree it is unsatisfactory to be told that the Homeric and other traditions are mere freaks of fancy without substance and without meaning. It is not easy to believe that the idea of Cyclopes, of Lotus-eaters, of Kirke or Calypso, came into the poet's head without any suggestion from without. Geographically, Mr. Bunbury can make nothing of Læstrygones and Phaiakians, and he is therefore content to banish them "to the outer zone of the Homeric world, in which everything was still shrouded in a veil of marvel and mystery. We can as little explain in the one case as in the other what gave rise to the original legend that has been amplified by the creative genius of the poet into the form with which we are all familiar." If by this nothing more is meant than that no geographical explanations

can be found for them, Mr. Bunbury's conclusion is perfectly right; but those who hold that the materials of these traditions may be examined by other methods which are not geographical will be apt to receive with impatience the assertion that the stories of the Hesperides, of the oxen of Herakles and the island of Erytheia, are undoubtedly Phenician, and may be tempted to reply that Mr. Bunbury himself has given the clue to the early form of the Argonautic tale when he says that the quest of the golden fleece may probably "be regarded as having formed from the first the essential nucleus of the legend." It is surely not more difficult to light on the nucleus of the Phaiakian story; and if we are to be reminded, as Mr. Bunbury reminds us, that "their ships had no need of steersmen or rudders, but knew of their own accord where they were to go," it would be well to tell us also that they knew—or, in other words, were in the habit of visiting—all the cities and fields of the earth. Thus we see that we are dealing with a fleet which could sail over the dry land, with ships which navigate the ocean of air. The scrutiny of the Homeric poems proves abundantly that the Phaiakian land has no place in the geography of the earth. The method of comparative mythology explains the story, not only in its origin, but down to its minute details. The two together finally set at rest the whole question of Homeric geography.

This is a most important result; and it opens the way for an unprejudiced examination of the geography of Hecataeus, Herodotus, and later writers. The light thrown on their ideas by Mr. Bunbury's exhaustive treatment is striking and often startling. The comparatively small effect which the introduction of scientific form and arrangement had in the correcting of misconceptions or the removal of blunders is one of the most wonderful facts connected with the history of geography. Mr. Bunbury's researches in this portion of his work assign their true value to the work of all the scientific geographers who followed Eratosthenes, and call for a separate notice.

DENT'S HISTORY OF BIRMINGHAM.*

THE *History of the Corporation of Birmingham*, some time since reviewed in our columns (see *Saturday Review*, October 26, 1878), was a work issued by the authority and under the direction of the Corporation itself. Its author dealt in a full and instructive manner with the special subject entrusted to him, and traced the growth of an important municipal organization out of the primitive and unpromising elements of the manor steward and the parish constable. With the domestic, social, and political life of the increasing town Mr. Bunce was only incidentally concerned. Mr. Dent, in *Old and New Birmingham*, has proposed to himself the more popular task of writing a "History of the Town and its People." And if we undertake the task of criticizing his work, it is only because he has shown that his subject is of more than local interest, and deserves a more careful literary treatment than is necessary for a publication issued in its present form. The volume before us has the appearance of a bound series of numbers or parts of a cheap periodical, and we believe that the work has actually been issued in parts. It is fully worth the labour of revision and of republication in an altered and permanent form; and among other things its title requires reconsideration. The custom of language from the days which distinguished the "Old" and the "New" Rome to those which recognize an "Old" and a "New" World has attached to the words the idea of local separation. "New" Birmingham should be in America or Australia. Mr. Dent is telling us of the same Birmingham past and present.

There are perhaps more dismal prospects in the world, and more gloomy moments in human life, than those which come within the experience of a passenger from London or Bristol when his train draws up at the Birmingham ticket platform. His eye wanders over a sunless waste, once evidently a smiling valley with its streamlet flowing between green hillsides, and strives in vain to pierce the smoke, while a strange, quick groan at intervals strikes his ear, apparently from the ground beneath his feet. These sounds proceed, not from imprisoned souls, but from the Birmingham proof-house; a term which it may be well not to explain too fully to nervous old ladies in the train. It is pleasant to obtain a glimpse through the "East Prospect of Birmingham" by Westley, taken in 1730, of some portion of this district in its earlier country aspect; and the "prospect," with its accompanying ground-plan, is additionally useful in enabling strangers to Birmingham to understand the principle which has governed the construction of what at first sight appears to be a very perplexing labyrinth. The passenger, ascending into daylight out of the enlarged rat-hole which represents the main station of the town, and into which he has found his way by a tunnel, is aware that the fine street forming the main artery of modern Birmingham must be upon a hill of some elevation, but may easily forget that the old lines of communication in the country are to be looked for in the valleys below. In fact, New Street is comparatively what its name implies, and the town has grown upon the intersection of the lines of traffic now represented by the two London and the Midland lines of railway. The converging roads from the south-east going out on one line towards Wolverhampton, and the Severn Valley road from Worcester into Derbyshire coming in below the hill from the south-west, formed the nucleus around which the old town grew, its one parish church of St. Martin standing just above the little stream known as the Rea, which carries to the Trent such waters of the high land on the west as do not fall towards the feeders of the Severn. The advantage of such a position as the key to the great mining district towards London and the whole of South-Eastern England, and towards Bristol and the South-West by the Severn, will be evident by a railway map even to such readers as have never experienced the sudden plunge at Birmingham out of the Warwickshire fields and fresh air into the smoke and dreariness of the long miles of "Black Country" beyond it. But, however impossible it may now seem to think of Birmingham as a country town, it is necessary to remember that it is not itself in the mining district, and that, as it gathered round the early village centre its growing industrial population, it became the home not of labourers, but of craftsmen. The original character of its trade may be illustrated from two existing instances, which exhibit great industries arising out of the demand for minute and carefully finished workmanship in vast quantities—the manufacture of steel-pens and that of screws.

Sword-blades and gun-barrels were among the heaviest products of Birmingham manufacture in the seventeenth century. Of foundries for cannon we have not observed any mention in this history, and we believe that there were none. "There exists," Mr. Dent writes, "a popular error among those who know our town but imperfectly, picturing Birmingham as grimy with the dense smoke of furnaces, echoing with the clangour of forges, gleaming with great fires. No picture of the town could be wider of the mark. Scarcely a bar or pig of iron has ever been smelted within its boundaries; there was a solitary furnace at Aston where the blast was blown by a water-wheel, and one of the first steam-engines in this neighbourhood was erected to supply its place." Even this furnace was blown out before 1795, and some cinders from its calx were cut and polished by an ingenious townsman, who "set them in rings and brooches, and sold them as fragments of Pompey's Pillar." The name itself by which the great industry of the town in its many branches was known during the eighteenth century sufficiently indicates its character. The trade of Birmingham was the "toy trade," and the great factory at Soho was established in 1764 by Matthew Boulton for the making of "toys." This word derives its current meaning from an original use for "petty commodities or trifles," and in its trade sense represented buckles, clasps, chains, and an endless variety of small articles of hardware. It was as "a Birmingham buckle-maker" that the "writer who signed himself Job Nott" addressed "his dear brother artificers" in a series of "pamphlets on local and imperial politics" at the time of the French Revolution and during several succeeding years. Mr. Dent is, as we have reason to believe, right in his conjecture of the authorship of these vigorous and effective papers, as to which it is matter of regret that "the most complete series known to be in existence was destroyed in the disastrous fire at the Reference Library"; a regret which is increased as we read the statement that "Job Nott was not among the lovers of liberty and progress, but rather of the unreasoning opponents of all reforms, and of those who in Birmingham ceased to exercise any great influence among the people subsequent to the close of the eighteenth century." It may be hoped that the author's general accuracy as a local historian is not to be judged by this specimen. The "influence" of a gentleman who was not more marked by his dignified presence than by his courteous manner and his cultivated mind is still fresh among Birmingham men. Mr. Theodore Price of Harborne was among the last survivors of those who could look back on the "Church and King" riots of 1791 as a memory of their manhood, and died at the age of ninety some thirty years ago. He was, indeed, a leading member of the group of thoughtful men who were ardent local supporters of Pitt, while Fox forms the centre of the group who, in Gilray's coarse caricature, are drinking the "Birmingham Toast, July 14, 1791"; and perhaps there is no community in England where political feeling so disturbs the exercise of fair judgment as that of Birmingham. This restless activity of thought and passionate rivalry of action may have grown out of the conditions of the local trade, which has depended on the inventive faculty, on the perpetual development of variety, and on the creation and following out of new lines rather than on a mere patient industry within accustomed grooves. It may be a further and more intricate psychological question whether a certain contempt for the rest of mankind which is a characteristic of Birmingham politicians may not be the result of a trade which has, in many of its branches, flourished in direct proportion to the prevalence of a public taste for show and shams instead of plain use and intrinsic value. It has been a "Brummagem" demand which created the "Brummagem" supply; and the shrewd brains and skilful hands which could "make you a hundred pounds' worth of jewellery out of a guinea and a copper kettle" must have learnt to despise their home customers as completely as they could despise the "Indians" for whom certain "medals in imitation of guineas and half-guineas" bearing the date of 1800 were executed. By an unintentional irony these curious evidences of a not too pious fraud have remained to this day in a drawer of relics side by side with "a silver medal on the death of Louis XVI., presented by Mr. ——," a manufacturer of such "toys," the latter bearing the legend, "Multis ille bonis flebilis

* *Old and New Birmingham: a History of the Town and its People.* By Robert K. Dent. With Illustrations. Birmingham: Houghton & Hammond. 1880.

occidit." It is doubted whether the tradition that Birmingham once drove an active trade in idols for the use of the Hindoos rests upon any sound basis of fact; but the spurious spade guineas "made for the Indians" are in point of morality on a level, if anything, not quite so high. There were tender consciences, certainly, among these makers of ancient shams; and Mr. Dent quotes from the late Recorder of Birmingham a good story of an artist in some vile metal known as "soft tommy," overheard by his master cursing the future wearer of the buckles which he was making, who explained that he only wished to be beforehand with the wearer, who was certain to curse him.

We have already pointed out the necessity for a careful revision and re-editing of Mr. Dent's History. It contains valuable material, but much in the same way that the contents of a gold-digger's cradle do so; there is a weary amount of "stuff" to be cleansed and sifted away before the genuine metal can be stored. The book as it stands has as much and as little title to the name of a "History of Birmingham" as a file of a London daily paper for the last century would have to the name of a History of England during that period. The vivid description of the "Church and King" riots of 1791, drawn mainly by the pens of two ladies, sufferers from the outbreak, is a nugget both of size and value; and the story of the "Political Union" movement, under Thomas Attwood, fifty years ago, is fully and vigorously told. The true character of the frightful outrages of 1791 may be learnt from Mr. Dent's pages, although he allows too deep a shadow to rest on the political and ecclesiastical party whose watchword was so shamefully paraded and abused. The magistrates, no doubt, were paralysed by the sudden explosion of licentious fury from the lowest stratum of the populace, which they were, till the arrival of the military, without any physical power to control; but the horror with which the riot was regarded and remembered in the true "Church and King" ranks of the town is still familiar to those who have heard its tradition from contemporaries. Birmingham in 1791 was no more represented by the rioters than "corner-men" represent the Liverpool of to-day.

Among minor details, the challenge to "wager of battle" by the accused upon a charge of murder at Warwick Assizes in 1817 is quite curious enough to deserve a particular account of the legal procedure in the case; but if Mr. Dent allows, in any revised edition of his work, the reappearance of the whole nauseous story of outrage and crime which he has disinterred for his present purpose, he will deserve criticism of a kind which for the present we suspend.

The illustrations throughout the volume are numerous and interesting, consisting of fac-simile engravings from local originals of various dates and various styles of art. The reproduction of a handbill of 1731 notifying the running of a "Birmingham Stage Coach," with woodcut heading, is among the most amusing and characteristic of these pictures, and by some unaccountable accident it is inserted in its proper place. For the rest, it might perhaps be possible to combine the letterpress and the illustrations upon some system of more incongruous inappropriateness than the ingenuity of Mr. Dent's printers has already devised; but our own powers would be entirely unequal to the attempt.

MADEMOISELLE DE MERSAC.*

THE materials of three-volume novels which deal with nothing more repellent and unnatural than the love stories of innocent people cannot but have a certain family resemblance. There must be at least two men in love with the same girl, and it is obvious that both cannot be successful. When a writer has got thus far he has to face the difficulties, first, of continuing the story through the rest of his three volumes, then of bringing it to a satisfactory conclusion. In one sense the latter of these is the greater. Padding a novel is not probably a very difficult task, and novel-readers are lenient enough as to the manner in which it is done, especially if the author is considerate enough to isolate the padding from the story proper, so that an experienced reader can tell at a glance what to skip. But to bring matters to an end which shall give general satisfaction is not so easy. If both the young men are meritorious, and one of them marries the girl, some kind of consolation prize must be found for the other. He may perhaps discover that he has really been in love all the time with somebody else, who has also been in love with him; or he may have a single but brilliant career, in the course of which he will from time to time look fondly and with a sigh at an old glove, or a locket, or a piece of crumpled note-paper covered with a girlish scrawl; or he may be the means of providing the happy couple with a handsome income, and find his reward in the contemplation of his own generosity. Perhaps any method of this kind is more likely to please than that which the writer of *Mademoiselle de Mersac* has adopted of causing the girl to die as soon as she has finally decided which of her two suitors she can and will marry. He adds, it is true, that, if she had married the chosen one, both she and he would have discovered that they had made a mistake; but probably many readers will feel that it would have been fair at least to give them a chance.

We have begun, as we believe some novel-readers are in the habit of beginning, at the wrong end of a book which is not without freshness and attraction. The author has provided for various tastes by making part of the action of the story take place in Algiers, with the scenery and life of which he is evidently familiar, and by having a list of characters, half of whom are French, half English, while his heroine is the daughter of a French father and an English mother. She and her brother Léon live under the care of the Duchess de Breuil, an old friend of their father's. This is what Mr. Norris says of his heroine's position:—

Mademoiselle de Mersac, whose character exhibited a good many traits of a kind more or less puzzling to her friends, was in nothing more incomprehensible to them than in her prolonged and voluntary spinsterhood. A young lady of the quasi mature age of three-and twenty, beautiful, well-dowered, of excellent family, and still unmarried, is no ordinary phenomenon in French society; but then Mademoiselle de Mersac was not an ordinary person, nor were her circumstances ordinary circumstances. Had she occupied a position analogous to that of her neighbours, her matrimonial affairs would, of course, have been arranged for her long since by provident parents; but Fate had decreed that she should make her *début* in society as an orphan, and, further, that she should do so in the exceptional character of absolute mistress of her own destinies. For the late Marquis de Mersac, influenced by his English education, his English wife, and also perhaps by certain melancholy experiences of his own, had harboured, and frequently expressed, an intention that his daughter should choose her husband for herself *à la mode anglaise*. Whether, after his death, his desires would have been respected by the Duchesse de Breuil (who, for her part, thought them eminently injudicious), had that lady possessed the power of opposing them, is at least open to doubt; but, happily or unhappily for Jeanne, she had no such power.

Mlle. de Mersac's marriage-portion was held in trust for her until the date of her wedding or the completion of her thirtieth year; and she could please herself entirely in the matter of marriage. The Duchess did what she could by bringing forward one eligible suitor after another, but Jeanne would have nothing to say to any of them.

Jeanne, when we are first introduced to her, is waiting for her brother Léon, who has been away in England; and, going to meet the horseman whom she takes for him, finds that it is a groom, with a note to say that he is stopping to breakfast in the town. The Duchess, when she hears of this, is irritated. She does not "like to think that my boy cares so little about seeing us again that he is ready to turn aside, as soon as he lands, to breakfast with the first one he meets. Who is his friend?" Jeanne replies, "M. de Saint-Luc, I believe"; on which the Duchess's face loses its cross expression, and she proceeds to speak in praise of Saint-Luc in an aggressive way. Finally, she asks Jeanne why she dislikes Saint-Luc, and Jeanne answers, "I neither like nor dislike him; I care nothing about him. But I do not think his company is likely to do Léon any good. He is a gambler; he has dissipated his fortune by betting and card-playing in Paris." It is needless to say that M. de Saint-Luc is one of the two regulation suitors of a three-volume love story. The other is a Mr. Barrington, a rich Englishman, who appears on the scene a little later. M. de Saint-Luc goes the wrong way to work to gain the love of Jeanne, whom, the Duchess has told him, he must woo "à l'anglaise"—that is, he must make her love him before she will consent to marry him. He knows her fondness for Léon, but he does not know her dread of his influence on Léon, and therefore he is very attentive to the brother, hoping thus to create a favourable impression on the sister, but in reality doing exactly the opposite. It is a well-meant but mistaken kindness of his to Léon that furnishes the author with the difficulty in the way of Jeanne's love affairs going smoothly which is the necessary point of departure. The thing is devised with some ingenuity, and should not perhaps be criticized too keenly. Léon proposes one night to Saint-Luc to turn into the club and play at whatever happens to be going on. Saint-Luc, who is himself going to play, advises Léon not to do so, "firstly, because they are playing lansquenet at the club to-night, and lansquenet is, of all games that I know, the one at which large sums are most easily lost. Secondly, because there is no luck in the air to-night. Thirdly, because you have not got enough money in your pockets. I have three hundred francs, the loss of which will probably sober me. You will lose what you have in a few minutes, after which you will take to paper and become reckless. Also, your head is not so cool as mine to start with." These are all excellent reasons, and, of course have no kind of effect on Léon. What Saint-Luc has prophesied, and more, comes to pass. The deal falls to Saint-Luc, and Léon, who is sitting next to him, covers his stake four times and loses. The fifth time he gets back his paper, and soon twenty francs of winnings. "That," says Saint-Luc good-naturedly in his ear, "is not the way to play lansquenet," and of course his timely warning has no effect. Léon continues his foolish system of doubling with other dealers, finally loses his temper, and might have got into a serious scrape but for Saint-Luc's intervention. The deal comes back to Saint-Luc, who in sheer thoughtlessness puts up a heavy stake, which Léon immediately covers. Luck runs completely against Léon, who by his continual doubles is merely blocking the way for other players. Saint-Luc attempts to help him out in a certain way which is prevented by the technicalities of the club rules. It may be noted that the description of the game is throughout admirably clear, and that the excitement is very skilfully kept up. Finally, having won a very heavy sum from Léon, Saint-Luc quietly passes the deal, which of course seemed a very cruel thing to do. He did it, however, with the best intentions, as Léon found out the next morning when Saint-Luc, saying that he had always found his card-winnings go out at the window, tore up Léon's

* *Mademoiselle de Mersac.* By W. E. Norris, Author of "Heaps of Money." 3 vols. London: Smith, Elder, & Co. 1880.

I. O. U.'s and flung them away. Unfortunately he had not calculated on the early training which made it impossible to Léon to consider himself discharged from his debt by such a process as this. Yet, if he were not so discharged, he would have to sell his patrimony. Only one way out of a serious difficulty occurs to Saint-Luc:—

"You said just now that a man cannot take a present of money from a friend—not that I ever proposed to make you such a present; but let that pass. One thing, however, you must admit; anybody may accept money from his nearest relations, and I think you could hardly refuse the sum in question if it were offered to you by—your sister."

"Quite out of the question," answered Léon. "Even supposing that I were enough of a scoundrel to rob Jeanne of her fortune, I could not do so. It is held in trust for her till her marriage."

"Yes; but upon her marriage I have heard—I understood," said Saint-Luc, a little confusedly—"that is, Madame la Duchesse told me, one day, that it would become her absolute property."

"That is so certainly, but——"

"Just allow me to finish what I was going to say. You know what my wishes have been, and are, with regard to your sister, and lately you have encouraged me to hope that, in spite of all that has passed, there might still be a chance for me. Well, supposing that I have the great good fortune to succeed, what I would propose to you is this. Let your sister, on her wedding-day, pay you 255,800 francs (a sum which is, I believe, more than covered by her dowry). You will then pass the money on to me, and all will be said and done. I don't see what objection you can make to such an arrangement. You must remember that, in suggesting it to you, I am thinking of her comfort as much as of yours, and that if you agree to it, you will spare her and Madame de Breuil an amount of unhappiness which, in my humble opinion, you have no right to inflict upon them."

This, however, leads to fresh and worse difficulties. Jeanne is terribly upset when Léon tells her what has happened. It seems to her that he has "allowed a stranger to think that he might take your sister in payment of a gambling debt." Nothing is further from Saint-Luc's mind than such a view of the matter as this, but Jeanne, with her unhappy prejudice against him, does not perceive this. So, Barrington having been summoned to England and gone away without any definite declaration, and Léon and Saint-Luc being on the spot, Jeanne agrees to a marriage with a man whom she cannot ever love, since she does love another man. This is a pretty complication enough, and its unravelling gives matter enough for the greater part of the second and third volumes of the book, which are diversified with clever sketches of character and scenery. We have perhaps had enough of the Franco-Prussian war in novels, but the writer of *Mademoiselle de Mersac* manages to treat it with a certain freshness. The book, if not violently exciting, is pleasant and wholesome reading, and is written with style and knowledge.

MALLESON'S HERAT.*

THIS book sets forth the importance, indeed the necessity, of our instantly acquiring Herat. And the argument by which this thesis is enforced has all the merit of novelty. The annexation is urged mainly on moral grounds. A good deal is, of course, made of the danger of allowing the place to fall to Russia; but we are also enjoined to go there as a matter of duty, not to ourselves, but to our fellow-creatures. "Polity, justice, humanity, the very safety of our Indian Empire, demand the movement. No people implore it more than the Heratis." "Again, in 1717 Herat experienced, for the first time, the horrors of conquest by the Afghans, and the still more prolonged misery of Afghan rule. The nature of that rule has been described in words that burn, by an eyewitness, the illustrious Hungarian, Arminius Vambéry. How the Afghan conqueror swaggers in the streets, disdaining work, but at any time ready to murder and to plunder; how the Afghan governor lays on imported and exported articles duties all but prohibitory, thus stifling the trade which is the life-blood of the place; how the very caravans which, before the Afghan period, traversed the neighbouring valleys and passes in safety, are now plundered within Herat territory, often with the connivance of the Afghan governor; how the people, ground down by taxes, by plunder, by oppression in its most loathsome forms, turn their longing eyes to England to rid them of their insolent oppressors—all these things, and more, are told in full detail by Vambéry. . . . Talk of Bulgarian atrocities! they sink to nothing when compared with the daily, hourly atrocities perpetrated by the Afghans upon the Heratis. . . . Her palaces are in ruins, her markets are but a shadow of what they once were, her children crouch before the insolent Afghan; but she survives, the vital spark still burns, dimly indeed, but it burns. . . . The first necessity is the removal of the oppressor who, for more than a century and a half, has so shamefully abused his position." And so on, in glowing periods. Here is a case clearly for humanitarian interference. It may be all very well for cold-blooded politicians to contemplate the possibility of counteracting the efforts of an insidious Power to possess herself of the garden of Central Asia; but the great heart of Liberal England will beat faster than that of a calculating statesman; here is something worse than the unspeakable Turk close to our own door, so to speak. We may gratify our noblest aspirations as a benevolent and beneficent nation, and do a good stroke of business into the bargain, by straightway marching on and taking possession of Herat. Nor will it be all patriotism and spending money. We shall soon be recouped the little outlay involved in the move by the great trade which would spring into life upon the annexation:—

In a few years Herat would prove the milch-cow of Northern India. . . . The actual products of the Herat Valley are assafœtida, saffron, pistachio-nuts, fruits of all sorts, gum-mastic, manna, wheat, barley, and other descriptions of corn. . . . The grapes are peculiarly luscious.

Who can doubt that the annexation would be self-supporting? The trade in pistachio-nuts alone should go far to pay for the cost of the garrison. It was that eminent philanthropist, Mr. Ralph Nickleby, who pointed out that there were nearly two millions of unhappy souls in London alone who never tasted muffins from one year's end to the other; but the number of our unfortunate fellow-countrymen who have never tasted pistachio-nuts at all must be vastly greater. The commercial uses of assafœtida are practically boundless. Nor is it only agricultural products which would reward our benevolence. "The existence of silver mines rests on the authority of Ibn Haukal and Edrisi," although it appears that the working of the principal mine "has been abandoned on account of its great depth and by reason also of the scarcity of firewood in the vicinity." But British capital and enterprise would no doubt soon overcome such difficulties as want of fuel or excessive depth. The American silver mines have lately shown signs of stopping their yield. We might call on the East to redress the deficiency of the West.

It is not too much to affirm that a few years of English administration would suffice to place Herat and its districts in the position with respect to Afghanistan which the province of Bengal occupies with respect to Northern India—that is, Herat would pay all the expenses of occupation of Afghanistan and still yield something more to the Treasury.

The comparison is apt. Bengal is about twice as large as France, and has sixty-six millions of inhabitants; Herat is in a valley perhaps five-and-twenty miles wide, bounded by rugged hills:—

But this is the least of the benefits its occupation would accomplish. The indirect wealth which would accrue to England by the possession of the key to the markets of Central Asia is not to be calculated. But it is not to the cupidity of the British manufacturer that I would appeal. There is something more important even than the commercial interests of the country. These people in their agony implore the protection of England.

And so on. There are some forty or fifty pages of this sort. The padding of the book consists of descriptions, taken from various writers, of the different routes to this promised land of milk and pistachio-nuts. Evidently there is nothing more easy than to get to Herat. You have only to hold Afghanistan in force, to put down all opposition throughout the country; to extend your line of communications from India, which you now find so easy to keep open, for about three times the length of the line now held from Peshawur to Cabul, a line held by nearly twenty thousand men, who do not command a yard of ground off the road they are standing on; you have only to do this, and Herat is yours. Along the proposed routes there are some well-defined tracks, if no actual roads, and on some of these water and food are to be got at every stage. True, for the greater part of the way, food, and at some places even water, would have to be taken by an army; and as General Roberts has not at present the means of moving one-third of his small force, our transport arrangements must first be overhauled; but these are, after all, matters of detail, and the troops, when they do get in sight of Herat, will be rewarded by picturing "what she may yet once more become should England accept the offer which the Heratis earnestly press upon her."

Colonel Malleson indeed lays great stress on the prosperity of Herat in former days, and assumes that, if it fell into the hands of a settled Government, it would thereon recover this prosperity, and become again a great commercial emporium. It is so very favourably situated for becoming the centre of trade in Central Asia. But when Herat is pointed to as having been a great city in ancient times, it has to be remembered that Central Asia also was a populous and fertile country, and that it will not suffice merely to govern a single district well if the surrounding country be sterile and barbarous. The truth is that a great blight has fallen over that as over other great tracts of the earth's surface—Palestine and North Africa, for example. The very climate of some countries has altered. It would be as reasonable to suppose that Babylon and Nineveh would rise to their former splendour if the Euphrates Valley railway were carried out, or that a great wine trade would spring up in Palestine if the Metropolitan police were set down there, as to suppose that Herat is likely to become again what it once was, if it were to pass into the hands of the British. It may become necessary some day to go to the extreme length of occupying Herat; although previously to doing so it would be necessary to put our Indian military system on an entirely new footing, and also to accomplish a real occupation of Afghanistan, matters which Colonel Malleson does not even allude to; but, if we are forced to such an undertaking, no sane person will be for one moment misled by such bunkum as this, that the Heratis are eagerly longing for their deliverance, and that Herat will turn out to be another Bengal and cover all the costs of occupation.

In truth this book is hardly worth serious notice. The grammar of it is on a par with the argument; as, for example, where we are told that "the eternal law which decrees that commerce shall find the quickest and cheapest route . . . . which, when the route by the Cape of Good Hope was discovered, abandoned the time-honoured markets of Venice." It seems to be an eternal law that our author's books are

* *Herat: the Granary and Garden of Central Asia.* By Colonel G. B. Malleson, C.S.I., Author of the "History of the Indian Mutiny," &c. London: Allen & Co. 1880.

to be full of fustian and bad English; but he does score one point which is of considerable importance. The Afghans did not show themselves good soldiers on the invasion of 1878, or again last year. They allowed us to carry what might have been impregnable positions with trifling loss. Nor have they proved more capable in attack. The only sign of ability in the late rising was the suddenness and secrecy with which it was effected. But that nevertheless they possess excellent fighting qualities, if these were turned to good account, there is no question; if they had been led by intelligent commanders, the advance on Cabul, so easily accomplished, would have been made quite impracticable for us, with our limited means. Therein lay the danger which the opponents of the Government policy have persistently ignored. They point to the difficulties of transport and communication which we have experienced, and ask how it would be possible for the Russians to march a great army through Afghanistan to the invasion of India. But no sane person, so far as we know, has ever contemplated such a thing. What, however, does seem plain is that it would be quite possible for Russia to organize and make use of the military resources of that country, when not only would it become quite unassailable, but the means would be afforded for making her position there a constant menace to India without the presence of any Russian army. The position for the English Government in India would then be quite unbearable. From that difficulty there is good reason to believe we have been delivered by the prompt action taken in the autumn of 1878. Had the advance been delayed even till the spring, the task would probably have been vastly more difficult. The enormous preparations which Shere Ali had been making, and the great accumulation of warlike stores found at Cabul, are significant of his belief, at any rate, that the time was coming when Russia and Afghanistan might be found in active alliance against India. Except with such an aim this great equipment would have had no meaning.

PASSAGES IN CHURCH HISTORY.*

THE editor, or, to use his or her own word, the compiler, of these volumes has attempted too much or too little. In a brief introductory note we are informed that Dr. Jenkins left at his death a mass of papers in a state of great confusion; that his intention had evidently been to give a general account of the progress of the Church from the Apostolic times to the present day, but that only portions from the history of each century had been written, and these in an incomplete and fragmentary form. The first three centuries were, in fact, dealt with by Dr. Jenkins in a volume called the *Age of the Martyrs*, published in his lifetime, and intended as an introduction to the present work. The note, after disclaiming responsibility for the opinions of Dr. Jenkins, whose "enthusiastic spirit led him to see only goodness and beauty where sterner judges would detect many errors," concludes with these ominous words:—"But, apart from the intrinsic value of the work, it certainly presents a picture of his own pure and devotional mind which cannot fail to be attractive to all, and deeply interesting to those who had the privilege of knowing him." Will friendly editors never learn that "masses of papers" which are deeply interesting to the privileged few cannot always be wisely submitted to the judgment of the general public?

Dr. Jenkins, as we learn from a brief memoir, was the holder of a Missionary Fellowship, who, after some eight years of work in Africa as chaplain to Her Majesty's forces at Natal, found his health so impaired by privation and hardship, as well as by the climate of the colony, that he was obliged to return to England. With the permission of the Bishop of London, at whose disposal he was placed by the conditions of his fellowship, he took up his abode for a time in Oxford, and employed his leisure partly in those ministrations among railway servants and their families which earned for him the title of the "Railway Apostle," and partly in literary work. Both in Oxford and afterwards at Aberdare Dr. Jenkins laboured among his people with great devotion and conspicuous effect; and it is with all the respect and admiration which such a life inspires that we proceed to express and, as we believe, to justify our regret that these fruits of his more studious hours have been given to the world in their present form.

The author's estimate of historical characters and events is, indeed, often such as to provoke criticism, and for this he must doubtless be held answerable; but for the fact that his incomplete and often carelessly worded notes have been strung together and presented to us in the outward garb of a book we must blame those who have had the disposal of his manuscripts. It was open to the compiler of these volumes either to produce a history based upon Dr. Jenkins's notes—a work which, if successfully accomplished, would have been a credit to himself—or to consider that as the materials had not been worked up into a literary form by the author, his reputation would be best consulted by withholding them from publication. The adoption of a middle course leaves us uncertain in many instances whether to lament the accidental incompleteness of an episode or to criticize the inadequacy of its treatment. When, for instance, we are told of Philip II., that "after the death of the Emperor he left the Netherlands and for the rest of his days dwelt in Spain, watching the rising up of the stern Escorial and laying the dead of his race in its vast dark vaults," we feel that this is neither history nor biography; but we are uncertain whether we are reading a grave assertion that Philip's later days were spent in attending funerals or a somewhat scanty note somewhat wordily expressed. The author's plan of telling the story of the Church in the biographies of those who were the representative men of periods or ideas is in itself most admirable, and has recently been carried out in part in the successful series of "The Fathers for English Readers"; but to deal with one thousand five hundred years of Church history in this or in any other way is a very serious undertaking, and one to which the two small volumes before us are manifestly inadequate. It was perhaps from a desire to economize time and space that Dr. Jenkins omitted all critical examination of many disputed questions and all mention whatever of not a few. Yet his verdicts upon some familiar historical characters and solutions of some well-worn historical problems are so unexpected that we would gladly have heard his reasons, and some notice of the existence of other views might reasonably have been expected.

In passages such as that which we have quoted on Philip II. there is a sacrifice of substance to what looks like an effort after picturesqueness of style, for which Dr. Jenkins was presumably himself responsible; but side by side with blemishes of this kind we find instances of slovenliness of composition and inaccuracy in grammar and orthography which should have been corrected by those who prepared his manuscripts for the press. These are most numerous in the earlier chapters. The attempts of Constantine to check the Trinitarian Controversy are thus referred to (vol. i. p. 3):—"He wrote to command the dispute to cease; but it was too grave for this." In p. 24 Eusebius of Nicomedia is spoken of as Eusebius of Nicedeia. At p. 54 we have "underlaid" for the preterite of underlie. Of the Cilician Mazaca we are told (vol. i. p. 67) "The town itself had changed its name to Cæsarea in the days of Tiberius, *because* (*sic*) Julian had passed through and found the temples of Jupiter and Apollo in squalid ruin, and had vented his useless rage in withdrawing from it its Imperial name." This account might at least have been rendered intelligible by the substitution of "but" for "because"; but in the very next page we read that "Cleanthes had learned from *Zeus*, possessing but a single garment and working as a porter for his daily bread." But we will not attempt the ungracious and unprofitable task of enumerating even the more unpardonable of the inaccuracies with which these pages abound. Let two other glaring examples suffice. At the bottom of page 454 of vol. i. we read:—"Luitprand, King of the Lombards, was sent back from the gates of Rome the remonstrances of Gregory II. The great new *by* power of the Franks was also ready to come over the Alps." These two bewildering sentences need only that the word "by" should be transferred from the second to the first, but no one has been at the pains to make this transfer. In the chapter on "The League" (vol. ii. chap. xxx.) the Massacre of St. Bartholomew and death of Charles IX. have been assigned to the years 1592 and 1594 by the substitution in each case of a 9 for a 7. And here we are reminded of an instance of Dr. Jenkins's odd system of selection among the disputed and undisputed facts of history. He tells us that, after the Massacre, "orders went into the country, and the deeds of blood were repeated throughout the land. Yet here and there men refused to execute such a cruel sentence, and were held harmless; the Bishop of Lisieux took it upon himself to suspend the execution as dishonouring the cause of Christ, and they that had been most fiercely persecuted by the Huguenots were now the first to shelter and protect them." This honour has been claimed for Hennuyer with equal confidence by previous writers, and perhaps we can hardly blame the author of a sketch of Church history for not discussing the objections which have been urged against the claim; but Lacretelle, for instance, couples with the Bishop's name that of Sigognes, Governor of Dieppe, pays a tribute to the "heroic humanity" of the Montmorencies, and records the names of the Viscount d'Orthe and the Count de Tende, who, so far from being "held harmless," died, it is supposed, by poison.

The eccentricities of form which we have noticed add much to the difficulty of criticizing the substance of Dr. Jenkins's work. Of the biographical sketches of which it mainly, though not entirely, consists, some are, as a matter of course, much better than others. It may, however, be said of them in general terms that they make no pretence to be written in a critical or judicial spirit; and, while the genial amiability of the author saves him from controversial bitterness, he does not attempt to disguise the strength of his theological and ecclesiastical bias, and often brushes away old conflicts of opinion by the mere uncompromising use of epithets. As we are hurried through the Councils of Nicæa, Tyre, and Sardica, the persecution of Athanasius, and the lives of SS. Basil, Chrysostom, Jerome, Ambrose, Martin of Tours, and Augustine, in less than one hundred and fifty pages, the accounts of Arianism and Pelagianism are necessarily slight; but we are surprised to find in the life of Augustine—in other respects perhaps the best of the early chapters, and one of the best in the book—no account at all of Manicheism. In the brief life of St. Martin it is spoken of as an Eastern heresy which "had the old characteristics of the Gnostics, sometimes 'the hurtful refusal of God's gifts, sometimes the depth of unhallowed licentiousness"; but of Manes himself, and the strange dualism of his system, we have not a word.

* *Passages in Church History.* Selected from the MSS. of the late Rev. J. D. Jenkins, D.D. Oxford and London: James Parker & Co. 1879.

When we come to the days of Charles the Great we learn with interest that a much earlier origin than we had supposed must be assigned to an error, historical this time, and not theological, which modern writers have been at much pains to explode. "His brother Carloman," we read, "died in the course of the year 771, leaving to Charles the whole of the vast heritage of his father. Soon afterwards he became known by the great name of Charlemagne." The domestic infidelity and military ferocity of Charles are ignored. Of his nine divorces, we only hear of that of Desiderata, while we are assured that he "struggled with his evil passions, and sought earnestly to subdue them by prayer and fasting, though the troubles of those unquiet days left him little time for such holy exercises." In the chapter on the scholastic philosophy the personal history of Abelard is passed over altogether. Yet it is surely possible to treat it in outline without shocking the sense of propriety of ordinary readers; and to say that "it seems plain that in his latter years his moral character had improved" is to trifle, however unintentionally, with the facts.

Of the Crusaders Dr. Jenkins speaks with unqualified approval:—"The cause of their lamentable failure was the profligacy of Frederick II., King of Sicily and Emperor of the Romans." Indeed there is in his references to this Emperor something of the bitterness to which Roman Catholic writers on the subject have accustomed us; and the whole chapter on "The Struggle of the Church with the Hohenstaufen," from its title to its last word, is the work of an advocate rather than an historian. If Hallam is too lenient to the Emperors in his treatment of this epoch, we may surely appeal to so orthodox a writer as the Archbishop of Dublin, and contrast his lecture on the Popes and the Hohenstaufen, the twelfth of his series on mediæval Church history, with the chapter before us. It is, as the Archbishop reminds us, "a thrice-told tale"; and indeed the Holy Roman Empire and the long tragedy of the house of Swabia are subjects of never-failing interest; but there is more reason on this account for a new historian to keep clear of the old animosities which have gathered round them. Frederick II. stands forth as the champion of irreligion, if not of Atheism—the scoffer, the deceiver, the libertine; and, even allowing for the trials of his position and the treatment he received from the Popes, history cannot pass a much lighter sentence on him than that of poetry, pronounced by the Ghibelline Dante. But for Barbarossa, "the greatest Emperor since Charles," and "one of the noblest figures of mediæval Europe," Dr. Jenkins has no good word; while Adrian, Alexander, Innocent, Honorius, and Gregory, are hardly ever mentioned without epithets of praise and expressions of admiration. In this chapter, at p. 151, occurs one of the clerical errors of the abundance of which we have had to complain. We are told that the struggle of the Church and the Hohenstaufen ended only with the deposition of the grandson of Barbarossa by Frederick II. at the Council of Lyons. For Frederick II. we must, of course, read Innocent IV. Though the defeat of Frederick at Legnano is described, we look in vain for an account of its results in the concession to the Lombard cities secured by the treaty of Constance.

On the interesting subject of Savonarola and the Medici Dr. Jenkins seems to write with a certain constraint. The relations of "Brother Jerome," as he calls him, with the Popes are doubtless embarrassing. We read that Savonarola, when summoned to Rome by Alexander VI., "spoke strongly against the unworthy Pope," and also that "Alexander VI. had undoubtedly been the chief cause of the terrible fate to which Savonarola succumbed": but we read also that "the last five years of the Pontiff's life seem to have been sanctified by a true repentance." This "unworthy" is the worst epithet which can be found for Roderigo Borgia, "the scourge of Christendom and the opprobrium of the human race"; and for the story of his death by poison, now generally and doubtless justly discredited, we have the story of his declining years "sanctified by true repentance." To Lucrezia Borgia we are introduced, without reference to her previous history, as married to Alfonso, "whom she aided with her clear counsel and wife-like affection, while she gained the respect and admiration of her husband's subjects by her unselfish wisdom and princely care." To this commendation is added a quotation from Roscoe, to the effect that "towards the close of her life she became severely rigid in her religious duties, and devoted herself to works of benevolence and piety"—words which certainly suggest a very different context. After this we are not surprised to read of "the saintly Giovanni de' Medici," but we confess to a feeling of strangeness in meeting in a later chapter (p. 529) with "Rubens, the pure-minded and devout."

To our author himself no one will deny the possession of these qualities. As children he would lead us, a child himself, through the dark and foul places of history, seeing but little evil except in opposition to the Church, from which he finds it hard to distinguish the Papacy. But while by its purity and simplicity his narrative seems fitted to be an introduction to Church history for young people, the faults of one-sidedness and inaccuracy which we have been compelled to point out make it a dangerous guide for beginners, and remove it far indeed from the rank of a standard authority for general readers.

CLASSICAL SCHOOL-BOOKS.*

MR. A. SIDGWICK'S edition of the Twenty-second Book of the Iliad is raised above the rank of merely rudimentary by a few aids to the use of grammar and lexicon, some small points of accentuation, and so forth. It may be added that the particular book is well chosen for its purpose; indeed it is apter for a young scholar's use than any other book of the Iliad except the Sixth, with the famous interview between Hector and Andromache. The student knows by heart every turn and bend in the eventful courses round the walls, the dreamlike chase wherein one cannot catch nor can the other escape, and where, in Zeus's weighing of the scales, Hector's eventually sinks. And the whole book is of equal value, whether we take Hector's dying prophecy of ill to his rival, or Priam and Hecuba's lament, or Andromache's thrice-touching dirge. Mr. Sidgwick gives in his introduction a brief summary of all that needed to be said as to Homer, his date, his critics, and the nightmare of Wolf's prolegomena, and we thank him for the admission that Wolf made the utmost of the "difficulty of oral transmission." On the whole, this little edition deserves the credit of "multum in parvo," and yet it is not crowded with supererogatory matter. On the ten lines v. 111—21 we are indebted to Mr. Sidgwick's elucidation for the discovery that there is no expressed apodosis; and he rightly and simply explains the proverbial line οὐ μέν πως νῦν ἐστιν ἀπὸ δρυὸς οὐδ' ἀπὸ πέτρης. There is an idiomatic repetition in v. 203, πυμάτόν τε καὶ ὕστατον, "last and latest," with which Mr. Sidgwick compares our parallel "first and foremost." In 219 πεφυγμένον ἄμμε, "escaped from us," is a strange deponent form only found in the epic.

Mr. Edmund Fowle appears to find a demand for a cheaper form of the collected lessons which make up his First Book of the Iliad. The latter half is printed without notes, though we are referred to the general vocabulary for the difficulties which may occur. Thus, if we look at v. 401, δίπτυχα ποιήσαντες, we shall find δίπτυχα ποιεῖν correctly explained "to lay double," i.e. to lay the flesh or thigh-pieces of the victim on a layer of fat, and upon this to place still another. Examination on other points shows Mr. Fowle to be generally correct, but we are not sure that his method is progressive enough.

There is more bone and muscle in the *Second Greek Reader*, of the Clarendon Press Series, whether we consider the valuable and practical syntax meted out to suit the precise needs of readers of Herodotus and Xenophon, and placed at the threshold of the volume, or examine the historical essays and notes referring to Marathon, Platæa, the Spartan State, and the Spartan King. It must be confessed, however, that it seems an awkward way of providing a new book of Attic Greek prose to take down one's Herodotus and convert him from Ionic into Attic, and it is hardly justified on the plea that fourth-form boys want more lively and real pictures of Greek history and Greek life than can be got in the limited scope of the *Anabasis*. The objection to this device is that we are not engaged on a genuine Greek author, and there is a suspicion of tinkering in the composition; though this does not apply to the selections from Xenophon, some of which are from the Lacedæmonian Republic and give details of the training of the heroes of Thermopylæ and Platæa, others the picture of the able Greek sovereign and statesman, Agesilaus. In his passages from Herodotus Mr. Bell has managed to include all the most stirring that are concerned with the invasion of Greece and the Persian war. Such anecdotes as the run of Pheidippides, the Athenian courier, and his mysterious message from the great god Pan to the Athenians, have a flavour of the Father of History that is worth preserving, though, as the note at l. 253 informs us, "it is unfortunate that Herodotus has not more exactly recorded the time of this remarkable run," a distance of 125 miles or so in two days. Here, too, are the death of Callimachus and the exploit of Æschylus's brother Cynegeirus; and we are obliged to agree with Mr. Bell that, when we get into the more technical Greek of Xenophon, things are less lively. There is much to be learned about the Spartan discipline; elaborate problems as to the training of boys and young men, now and then involving such unusual phrases as τὸν τορωτέρον τῶν εἰρένων, "the sharpest of the twenty-year olds," for εἴρην was the technical word for the Spartan youth after twenty, of an age to speak in the Assembly and to command troops. We have already mentioned the succinct, lucid,

* *Homer's Iliad.* Book XXII. By Arthur Sidgwick, M.A., Tutor of Corpus Christi College, Oxford. London, Oxford, and Cambridge: Rivingtons. 1880.

First Book of Homer's Iliad in Graduated Lessons, &c. By Rev. Edmund Fowle. London: Longmans & Co. 1880.

Second Greek Reader.—Selections from Herodotus and Xenophon. With Introductory Notes and Vocabulary. By A. M. Bell, M.A. Oxford: Clarendon Press. 1879.

The Georgics of Virgil. Book IV. Edited by C. E. Jepp, M.A., Head-Master of King Edward's School, Stratford-on-Avon. London, Oxford, and Cambridge: Rivingtons. 1880.

The Phormio of Terence. Revised Text and Notes. By Rev. John Bond, M.A., and Arthur S. Walpole, B.A. London: Macmillan & Co. 1879.

Cæsar de Bello Gallico. B. I.-III. Edited by J. H. Merryweather, M.A., and C. C. Tancock, M.A., Assistant-Masters at Charterhouse. London: Rivingtons. 1880.

Livy's History of Rome. A Literal Translation from Text of Madvig. Books V., VI., VII. By "A First-classman." Oxford: James Thornton. 1879.

and work-a-day syntax which is so valuable a part of this manual.

The next volume on our list is a prize in its way—the Fourth Book of the Georgics, edited as a labour of love, with rare pains and refinement, by Mr. Jepp. Not that there is any lack of exponents of any part of Virgil; but somehow new beauties rise unbidden to the faithful admirer of the most cultivated of poets. Little niceties of sense yield themselves to the competent scholar like Mr. Jepp who limits his study to a choice portion, such as the Bee-book, and treats it in a way wherein no critic can complain that aught of importance has been overlooked. He has doubtless read and re-read his commentaries. We are reminded of Conington when, in reference to v. 29, he calls attention to Virgil's grandiose manner in the line "Aut praeceps Neptuno immersit Eurus." Here "Neptuno" is = aquâ, by metonomy, just as in 64 at "Matris quate cymbala circum," "matris," standing for Cybele, the mother of the gods, is another instance of Virgil's magniloquence. Compare "Pocula Acheloia," in the First Book of the Georgics. In v. 50 Mr. Jepp aptly notes on "vocisque offensa resultat imago," the instance of transferred epithet by the figure Hypallage, it being the voice, not the echo, which strikes. Mr. Blackmore poetically turns it, "And baffled, backward leaps the ghost of sound"; and Mr. Jepp's translation is often as good as if it were poetry, for neatness and point of expression. In v. 105 *seq.*, Virgil gives directions for clipping the queen's wings to keep her from straying, and this plan, as Mr. Jepp informs us, is recommended also in Hunter's *Manual*. In like manner, at 178, in reference to the division of labour among the bees—"Grandaevis oppida curae Et munire favos, et daedala fingere tecta"—we are referred to Aristotle, *Hist. An.* ix. 40; though Mr. Neighbour states that, as a matter of fact, the younger workers perform all the home duties for the first two or three weeks of existence, till they are strong enough to forage; and at v. 190, "Fessosque sopor suus occupat artus," we are reminded that Huber and Von Berlepsch maintain that bees do sleep, though the process of honey-making is not intermitted by night. "Sopor suus," according to Conington, = the sleep they need; according to Mr. Kennedy, "their peculiar sleep." On the interpretation of the lines,

> Quotque in flore novo pomis se fertilis arbos
> Induerat, totidem autumno matura tenebat,

we cannot doubt that Mr. Jepp's sense is the true one, which connects "matura" with "poma," not "arbos." "All the fruits his prolific tree had clothed itself withal at early flowering, full as many it retained in autumn ripeness." Mr. Blackmore's verdict is in the same sense. In the episode of Aristaeus occurs a line which has been the subject of some dispute, whether, when that famous beemaster says to Proteus, "Scis, Proteu, scis ipse; neque est te fallere quicquam" (427), the sense is, "Nor is it possible to deceive you in aught," or "you cannot give me the slip, do what you will, so give up the attempt;" it seems to us that the taking "fallere" as *i.q.* λανθάνειν settles the question. For a specimen of Mr. Jepp's renderings we may cite vv. 523-27, "Tum quoque marmorea—flumine ripae." "Even then, while Hebrus, stream of Oeagrus his sire, was rolling down in mid-current the head torn from that marble neck, his very voice and his tongue now cold in death kept calling, Eurydice! ah, poor Eurydice! with fleeting breath. Eurydice! the banks re-echoed all adown the stream." Of course he refers to Pope's parallel passage in the Ode on St. Cecilia's Day. Mr. Jepp will do well to annotate some other choice classic gem.

Messrs. Bond and Walpole's edition of the *Phormio* of Terence apparently claims in its preface to lay the foundation of a third critical edition of the dramatist. They first animadvert, not quite undeservedly, on Mr. Parry's ultra-conservatism as to MSS. The second edition to which they refer (Professor Wagner's) they cannot acquit of carelessness; and it may be owned that they themselves come before the public with a text vastly improved by a return to the reading of the Bembine Codex, and by the help of the edition of Umpfenbach. They are, it must be added, somewhat cavalier in their ignoring of more than one good serviceable Terence of the last quarter of a century. Their own work is extremely elementary and slender in respect of prosody and scansion, a matter in which as yet no English editor has achieved much. We have to thank them, however, for a capital introduction to Terence and to Latin comedy. It deals in interesting notes on Terence's loans from the Attic New Comedy, as seen in his seven extant plays, and examines his humour, his plots, his sentiment, and character-painting, with much appropriate illustrative remark. Of the scansion we have said that the account given in the introduction is slender; but it is just to add that when we are once in the midst of the play, the editors elucidate patiently all difficulties, and never leave the tiro hopelessly in the lurch. In glancing over the first act one or two notes have struck us as worth notice, either for appositeness or defect. In the first scene, 43-44, are two highly appropriate notes—one grammatical, the other illustrative—on *unciatim* as the accusative case of a noun used adverbially; the other on the antithetic force of the same word in the studied climax—namely, "What the poor wretch *ounce by ounce*, with miserly stinting, has barely spared from his rations, all this is to go at one fell sweep." At v. 47, "alio ferietur munere," we demur to their statement that the expression does not occur elsewhere, and see no occasion for connecting the phrase with a mistranslation of πληγέντες δώροις, in Herodot. viii. 5. "Ferire" here, as in *Propert.* III. iii. 50, and in Plaut. *Trin.* ii. 119, is obviously "to cozen," and is so given in Lewis and Short's *New Latin Dictionary* (Clarendon Press). The editors deserve the credit of their note on vv. 48-9, as to the punctuation "ubi erit puero natalis dies, ubi initiabunt," explaining this by referring the allusion to the ceremony of "weaning." A capital note, at v. 89, illustrates the word "Tonstrina," that many-featured "Truefitt's" of ancient Rome—a lounge as popular as the Balnea of the Empire, the κουρεῖα of Athens, or, as the editors note in an afterthought, the kindred lounge at Florence (see George Eliot's *Romola*).

Editions of *Caesar's Commentaries* threaten to flood the market; but we cannot doubt that the first instalment of Messrs. Merryweather and Tancock's *Caesar de Bello Gallico* in Rivington's Classical Series fully justifies its existence. Adopting the text of the last edition of Kraner (Dittenburger, Berlin, 1877), but accommodating the numbering of sections to correspond with the Oxford Pocket Classics edition, they have further laid Kraner's notes under contribution for matters of detail and illustration; whilst for sites of battlefields, routes of march and geographical questions, they own themselves indebted to Napoleon III.'s *Julius Caesar*. A short and clear introduction discusses "Gaul and its relations with Rome," and gives the life of the conqueror of Gaul up to 58 B.C. We may also commend the general accuracy of the geographical indices which form part of the appendix. It remains to be added that this edition furnishes a clear readable type, a sufficient descriptive heading to each chapter, a map or plan at need to explain to the reader such details of Roman and Gallic strategy as the field of battle with Ariovistus or the battle on the Sabis, and a practical running commentary. Wherever we have tested the notes, as in the campaign against Ariovistus, they strike us as admirably to the purpose, whether critical or explanatory.

We scarcely know what to say to a translation of the Fifth, Sixth, and Seventh Books of Livy, professing nothing higher than to pull pass-men through moderations, intended to be literal, though not slavishly so, and to give only elementary details of the political history of Rome in an introduction of eight pages. The translator shrouds his identity under the mysterious title of "A First-class man." A glance at his handiwork in translating Camillus's speech (Book V. 49-50, &c.) enables us to assess him as neither better nor worse than the common run of manufacturers of "cribs," which are precisely the kind of translations that scholars do not desire to see multiplied. It is probably well fitted for its not very ambitious purpose of passing undergraduates through the previous examinations or moderations.

QUEEN OF THE MEADOW.*

MR. GIBBON'S novel answers to its attractive name, and from the first page to the last has a pleasant fragrance of the country. He deals in charming rustic descriptions without indulging in them to excess, and your fancy can realize the farm of his *Queen of the Meadow*, with its rick yard and rich hay fields, and its general air of peace and plenty. We appreciate the care he has evidently bestowed on his work, and the thought he has given to developing his characters. But in the composition of his story and the unfolding of his plot, he inclines to a somewhat far-fetched exercise of ingenuity. Considering that his chief hero and heroine are eminently frank in speech and straightforward in mind, we feel that they must have quickly come to understand each other in place of prolonging a game of cross purposes. Polly Holt, the Queen of the Meadow, and mistress of the Meadow Farm, is a pretty and unprotected female who can very well take care of herself. She does not lead an altogether solitary life, for her cousin, Sarah Hodsoll, shares her home and the cares of the establishment. But naturally a woman with such weighty agricultural responsibilities is all the better for having a man of knowledge and experience to lean upon; and Polly has got into the habit of having recourse to her cousin and neighbour Michael Hazell. Nobody doubts that Michael adores her. With her quick perceptions, she is fully alive to the fact that she could hardly find a more stalwart arm to lean upon. He is always eager to place his time and intelligence at her disposal, and he is thoroughly conversant with all farming affairs. These gifts and qualifications of his, however, serviceable to her as they are, form only a small part of his merits. In temper, as well as in character and conduct, he is as nearly perfect as a man can be. Moreover, he carries the embodiment of the spirit of chivalry into the business of his everyday life; and in the course of the story she has opportunities of learning the self-sacrifice and devotion of which he is capable. Possibly he has made the mistake of a man earnestly in love, and has shown himself too tender and submissive. It is certain that she trifles with his feelings unfairly; and, after treating him one day as a head-bailiff or a brother, she wounds him the next by thrusting him off at arm's length. We do not blame him for not being quicker to comprehend her—for not making a resolute clutch at the prize which is almost within reach of his strong hand. It is the nature of true love to be timid and self-diffident. But we do feel afterwards that he is provokingly and persistently dull when he fails to read the signs of her readiness to yield to him.

* *Queen of the Meadow.* By Charles Gibbon, Author of "Robin Gray," &c. Chatto & Windus. 1880.

Mr. Gibbon takes a pride in perpetually tantalizing us, by making Michael put aside the happiness which we know awaits him in the end. Time after time he brings him up to Polly, who plays about him like a shy filly round a sieveful of oats; and when Michael has only to throw the arm with the halter round her neck, he makes some awkward movement that scares her away. So we grow somewhat weary of the repetition of scenes which wantonly delay the inevitable *dénouement*.

The book reminds us in many respects of Mr. Hardy's *Far from the Madding Crowd*, though we are too well persuaded of Mr. Gibbon's originality to believe that he ever consciously borrowed from it. He does not show the same lively appreciation of quaint rustic humour in depicting his clodhoppers and repeating their talk; but he is by no means destitute of the sense of drollery, and the language of his people is always natural, while his conceptions of them never turn towards caricatures. Like Mr. Hardy he puts forward an aspirant to the hand of the heiress of the farm who is altogether unworthy of her; yet he not only attributes redeeming virtues to Walton, but makes him come to good in the end. Indeed, Tom Walton is perhaps more natural than Michael Hazell, because he is far less admirable. He is a man to touch the fancies of many women, though hardly perhaps the fancy of such a girl as Polly Holt. One of the gravest indictments that can be brought against him in striking his moral balance-sheet is the number of female hearts he has played fast and loose with. Besides that, he is unduly addicted to jovial company, and has risked and lost far more than he could afford in the racing for which he neglects his farming. Walton is very much an English counterpart of the fast Irish squireen of a former generation; and he is all that would be most objectionable to the refined tastes of a "born lady." He lives upon the borders of a wider world than that of his parish, without belonging to it; he frequents the great meetings at Goodwood and Epsom, where he has been in the habit of burning his fingers till he has involved himself heavily in debt. So of course he gives himself the airs of a man of fashion among his neighbours, and these airs sit very awkwardly upon him. He is apt to give himself the airs of a conqueror, too, on very slight provocation; and Mr. Gibbon makes clever use of these in Walton's interviews with Polly. Whenever she yields him an inch, he immediately takes an ell. We have too much confidence in Polly's good sense and discernment to believe that he is even a formidable rival to Michael. Yet there is no reckoning absolutely with the caprices of the wayward nature with which Mr. Gibbon endows his heroine, and there is always excitement in the notion that it is quite possible she may make a fool of herself. There are clever touches of the unpleasant side of human nature in the selfishness induced by intense concentration on her own feelings, in a nature that is otherwise open-hearted and generous. She is strongly attached to her cousin and companion Sarah. The two girls have lived hitherto in unreserved intimacy, and yet, though her own love anxieties might have sharpened her quick perceptions, she shows herself altogether blind to the state of Sarah's heart. It never occurs to her that that silent young woman, who has become of a sudden so very odd in her ways, is really pining in secret for Walton, and letting concealment like "a worm i' the bud, prey on her damask cheek." Yet all the time the changes of mood of the heiress are putting Sarah through torments of jealousy and apprehension. If Walton is once fairly rejected, there is the hope that he may come back to what Sarah would call his first love—to what he might have characterized himself as a meaningless flirtation. A sharp-sighted girl, saying little and thinking much, she sees all the time even more clearly than Polly, that Walton is unlikely to make a good husband. There is the ring of earnest passion in the words with which she breaks out hotly on one occasion, when Polly is discussing the propriety of engaging herself to Walton, and weighing the chances of being reasonably happy with him. She asks the advice of Sarah, as that of a thoroughly disinterested party, and of course without the slightest intention of taking it. Sarah flashes out, "I will tell you what I would do—I would leave him to the woman who cares enough for him to risk her happiness on the chance of keeping him straight; and who, failing in that, would still be faithful to him when he sank into the worst state of poverty." Even then, notwithstanding the fervour of the words and the violence of the gesture, Polly suspects nothing of the passion that prompted them. No wonder that Sarah resents a blindness which is not only unfeeling but singularly unflattering; and when her jealousy makes her guilty of rather a malicious action afterwards, we cannot help feeling that there was every excuse for her. We fully appreciate the principle of art which groups the minor interests and personages round a single prominent central figure. Yet, considering the part she has to play in the story, Mr. Gibbon keeps Sarah somewhat too much in the background. We rather surmise her actual idiosyncrasy than understand it. And our sympathies with her in her unfortunate attachment and trying domestic circumstances are but languid, because it is only latterly we recognize that she is really a very attractive young girl, who might aspire without presumption to captivate the volatile Mr. Walton.

A more commonplace writer must have brought his story to an abrupt conclusion with the generous devotion of Michael Hazell on the death of his father. The old man's end had been hastened by some business anxieties. A county bank had come suddenly to grief; and an exceedingly bad case of bankruptcy it must have been, since next to nothing was paid in the pound. Polly's fortune had gone in the crash; and, by her father's will—by the way, one of the oddest and most fantastical we remember to have met with in the pages of fiction—old Hazell was in some measure morally responsible. He agrees with his son that Polly must be saved, as far as possible, from the consequences of the failure; but his natural idea is that the cousins, who seem such excellent friends, should fulfil the dearest wish of his heart and marry. Michael Hazell goes much further. He desires that his father should make a will leaving his money to Polly, as being merely the settlement of her lawful claims; so that, in place of being fettered to him by an intolerable obligation, she shall be free to wed Walton or anybody else. And he goes the length of deceiving his father into destroying the will in which he had set out the true state of the case. Polly gets scent of the pious fraud, and with womanly ingenuity and perseverance puzzles out all the facts. Is it credible or natural, we ask, that instead of being melted by Michael's self-denying tenderness for her and by his delicate generosity, she makes a bitter grievance of his having sought to deceive her, and treats him with a petulant severity that reduces him to wretchedness and despair? It is true that she loves and respects him in her heart all the time, as she well may do; that she is treasuring a withered rosebud of his as a love-gage; and that her aggressive petulance is in great measure simulated. But we repeat that we decline to believe for a moment that a girl of her honourable and warm-hearted character could have been warped into a course of ungrateful injustice which must have troubled her conscience with intolerable qualms. We think we have said enough to prove our assertion that Mr. Gibbon carries ingenuity too far in imagining refinements of subtlety in the behaviour of his characters. But at all events it is a fault on the right side, though he would draw his sketches more true to the life were he to put some check on the exuberance of his fancy.

FRENCH LITERATURE.

COUNT ADHÉMAR D'ANTIOCHE'S *Deux diplomates* (1) is not exactly a book for the general reader, but it is likely to prove interesting to those who have studied the political history of Europe towards the middle of the nineteenth century. The two diplomatists are Count Raczynski, a Polish nobleman who attained a high position in the Prussian diplomatic service, and the better known Spaniard, Donoso Cortes, Marquis of Valdegamas. The book consists of an interchange of letters between the two extending over the period 1848-1851. It thus deals chiefly with the troubles of the first year and their settlement, the establishment of the French Empire, &c. Both Raczynski and Cortes were fervent Anglophobes, and this book is a good reminder of the time when Palmerston was the bugbear of half Europe. "L'Angleterre c'est le mal," says one correspondent, and the other remarks that he has made against us "le serment d'Annibal." Putting this frame of mind aside as a curiosity, and noting as its corollary the frantic terror of "la Révolution" which both writers display, we may say that on some isolated points, such as the character of the Third Napoleon and his rule, interesting views and opinions are given.

The title of M. Paquier's history (2) is perhaps a little misleading. The reader may expect to find it occupied with an account of the deeply interesting subject of the old provincial autonomies of France, and of their modification and gradual absorption. As a matter of fact, however, it is rather a discursive essay on the general history of the country as modified by the general history of Europe. Digressions are frequently made of an even less relevant character, as when M. Paquier deals lengthily with the rise and establishment of the Prussian and Russian monarchies. Indeed the book seems to be rather a channel for the conveyance of a certain number of general historical *aperçus* than a systematic treatise on its subject, or on any subject. It winds up oddly enough with a tirade against this country. We made France our catspaw in the Crimea (where it hurt our *amour propre* that she saved us at Inkermann), in China, in Mexico; we nearly wrecked the Suez Canal; we spoilt the chance of checking Prussia by refusing to interfere in behalf of Denmark; we left France in the lurch in the war of 1870; and (crowning injury!) we sent her "sacks of potatoes" afterwards. The passage has not only intrinsic interest for Englishmen, but exhibits well enough the engaging desultoriness of M. Paquier's method.

The group of great soldiers of various ranks who helped in the early part of the seventeenth century to carry out the ambitious designs of Henry IV. and of Richelieu, and who threw the appearance of military glory over the earlier part of the reign of Louis XIV., occupy an important place in military biography. M. Bourelly's hero (3) was almost as typical of the less splendidly descended class of these warriors as his brother Marshal, d'Artagnan, whose memoirs suggested to the genius of the elder Dumas his most famous, and perhaps his best, work. Fabert was a member of a family which, while nominally noble and possessed of considerable property, did not scorn to pursue various profitable avocations of a commercial

(2) *Histoire de l'Unité politique et territoriale de la France*. Par J. B. Paquier. Tomes 2-3. Paris: Hachette.

(3) *Le Maréchal de Fabert*. Par J. Bourelly. Première partie, 1599-1652. Paris: Didier.

and semi-commercial kind. His father was a celebrated printer, and the young soldier himself at a later period derived revenues, very large for the time, from some iron works in the neighbourhood of Metz, which was the seat of the family. But he early showed ability and taste for military pursuits, and the Thirty Years' War gave him ample employment. His first patron was the Duke d'Epernon, and this for a time made him rather obnoxious to the young King Louis XIII., and his favourites. But Fabert's bravery and military skill, with or without patronage, made his way, and Richelieu was not a man to discourage such an officer, whose birth was not likely to render him dangerous to the State, and whose military capacity could do it service. When this volume (which is to be followed by another) closes we leave Fabert governor of Sedan, a peculiarly important post because of the neighbourhood of the frontier and the machinations of the dispossessed Duke of Bouillon. This government he held for many years, including the earlier period of the Fronde, where the narrative for the time ceases.

Two more bulky volumes of M. Thiers's speeches (4) cover the years 1842-1848. Among the speeches of more or less general interest which they contain may be mentioned two on the vexed question of the right of search, 1842; one (with references in others) on the Tahiti business, 1844; one, of peculiar interest when we remember what happened later, on the fortifications of Paris; and several pronounced in February 1848, and dealing with not a few of the circumstances which led to the Revolution.

There are few classes of books to which the historian of the dignified kind is more indebted than that to which M. de Calonne's work (5) belongs, nor are there many which have a greater interest for the general reader who has some tincture of history. The title describes it fairly enough. It is a careful summary of what may be called fifteenth-century daily life in Amiens, Abbeville, and other towns of the same district. Municipal offices, food supply, prices, finance, charity, the administration of justice, military arrangements, and so forth, have each its chapter, and in each a crowd of interesting facts will be found. M. de Calonne is evidently a believer, though not a fanatical believer, in the good old times. In one respect he certainly makes good his case, as far as figures go. It has often been debated whether the material comfort of the lower classes has or has not kept pace with the development of wealth and luxury among the upper. Macaulay, it will be remembered, as regards England in the seventeenth century, took the side of the progressists very decidedly. M. de Calonne, as regards France in the fifteenth, takes with equal decision and with more accurate and elaborate figures the side of the past. He points out that at that time the daily pay of a fully qualified mason, carpenter, or other such workman, was equal to about seven francs—much higher than the corresponding amount now. But the actual value is even more in favour of the fifteenth century, inasmuch as the workman's daily pay would have enabled him to buy forty-eight pounds of bread, three gallons of wine, two hundred eggs, or eight pounds of butter, any one of which purchases would, it is hardly necessary to say, cost far more than seven francs now. This is only an instance of the kind of information which is contained in abundance in this very interesting and well-arranged book. The sections devoted to municipal, military, and charitable arrangements are particularly well worth attention.

The thirteenth and fourteenth volumes of M. R. St. Hilaire's History of Spain (6), which conclude the work, cover the period from 1764 to 1833. The greater part of the space is naturally taken up with the Peninsular War, of which M. St. Hilaire gives an account not aiming at any special picturesqueness, but clear, fair, and, to the best of our examination, accurate. His notices of Wellington are very different from the usual French treatment of that general, though, on the other hand, he has adopted the somewhat exaggerated condemnation of Soult which has become fashionable among those who wish to excuse the failures of the French in the Peninsula. That Spain and the Spaniards play the least part in these volumes is not the fault of M. St. Hilaire. The really interesting part of Spanish history had passed before they begin.

Some books of travel, more or less attractive in themselves, also illustrate different ways of writing such things. MM. Verbrugghe (7) occasionally fall into the rather painful mood of jerky jocularity which too many travellers think it necessary to assume. But, on the other hand, their descriptions of scenery and atmospheric effects are frequently much above the average, and the subject gives them good scope. The book records a journey round rather than through South and Central America, with delays of some length on the Amazon, in Peru, and in Columbia. The Amazonian portion suffers, as do most books dealing with that subject, from comparison with Mr. Bates, though MM. Verbrugghe are much more deliberately picturesque than that excellent naturalist and topographer. In less trodden ways they show to better advantage. On the other hand, the well-known author of *Le Pays des Milliards* is nothing if not a dramatic traveller. M. Tissot (8) is to be congratulated on the interesting conversations he has wherever he goes, on the cordial welcomes with which he meets, and above all on the extraordinary beauty of the damsels who everywhere present themselves to his enraptured gaze. Istria, Croatia, and Hungary are still sufficiently little known countries to give a traveller of this kind great advantages, and M. Tissot has produced a lively and readable book. It is, as we have hinted, written in ink of very bright rose colour, the actual attractions of the countries travelled through being evidently enhanced to the traveller by the fact that his foes the Germans are not popular there. M. Tissot tells us with much relish how, something once having been lost in a mixed company, the only German present was promptly charged (on no other evidence than his nationality) with the theft, the stolen property being immediately discovered on him. But, apart from ebullitions of childishness like this, the book is not unamusing, though the salt-cellar is, we think, occasionally necessary during its perusal. M. Cotteau (9), again, represents a third order of travellers, and to our mind the best of the three. His subject is of course a sufficiently hackneyed one, though less so to his own countrymen than to us. But the narrative of his three or four months' run through India and Ceylon is very fluently and pleasantly written, free alike from travellers' jocosity and from travellers' tales, and quite readable even by those to whom Ellora and Madura, Elephanta and the Taj, are very familiar stories. The tour was only finished a twelvemonth ago, and therefore may probably claim to be the most recent book on India. It is, however, simply a sketch of a tour, and does not pretend to any but very occasional reflections, political or other.

The seventh volume of M. Baillon's elaborate and profusely illustrated work on botany (10) includes the families of Melastomaceæ, Cornaceæ, Umbelliferæ, Rubiaceæ, Valerianaceæ, and Dipsacaceæ.

Dr. Lesson (11) appears to have served for many years in the medical department of the French navy, especially in Polynesia. His stay in that part of the world seems to have terminated in 1850, but we gather from the preface that want of official encouragement deterred him from an earlier publication of his researches. The present bulky volume is only the beginning of a work intended to prove, contrary to the general opinion, that the Polynesian races must have originated in New Zealand, or thereabouts. It contains elaborate anthropological details of the inhabitants of the various groups. These details do not wholly exclude manners and customs, but are chiefly occupied with physical and linguistic characteristics.

The title of Dr. Joyau's thesis (12) may strike some readers as rather an odd one. Instead of invention, we might almost read imagination, for it is with this faculty and its applications that he principally busies himself. The essay is well written, and not uninteresting to read. It is distinguished from much of the philosophical writing of the day, and assimilated to that of the last and preceding centuries, by being much less full of technicalities and by not being definitely attached to any school.

"The Logic of Hypothesis" (13) is a sufficiently scholarly handling of a not very different subject treated in a somewhat stricter form. M. Naville discusses the uses and limitations of hypothesis in science, partly from the historic, partly from the critical side; and, according to a good old practice, now too much neglected, he has added an appendix of objections or queries, with replies thereto.

M. Paulhan's contribution (14) to the *Bibliothèque utile* is, like most of the volumes of the series, popular, not to say anecdotical, and abounds in extracts.

La question du divorce is (15), as may perhaps have been anticipated, a very well written book which had much better not have been written at all. In form it is a reply to a certain Abbé Vidieu, whose intellectual calibre may be inferred from the fact that he seems to have informed the congregation of St. Roch that in the market-places of London and other English towns unhappy women, with downcast eyes, may be seen put up for sale by their brutal husbands. It is only fair to the Abbé to mention his perfectly true statement that no such sight can be seen in Catholic Ireland. It appears, moreover, that the British Government has in vain endeavoured to get the odious law altered. Of such an antagonist M. Dumas has of course, as he would himself say, *beau jeu*. His method reminds students of French literature of that of certain of the *philosophes* of the last century, and especially of Helvétius in his famous book. There is a wonderful parade of learning, which, somehow or other, is generally directed to the extraction of matters which might quite as well have been left in their obscurity. There are passages of real literary merit, and indeed of eloquence, in the book, but its compound of virtuous indignation and questionable details is not pleasing.

M. Dumas has preferred to occupy himself rather with the Abbé Vidieu than with Père Didon (16), though there is some

(16) *Indissolubilité et divorce.* Par le Père Didon. Paris: Dentu.

reference to the latter in his volume. The Jesuit Father's sermons on the subject were, it may be remembered, interrupted, but not because they were in any way scandalous. Père Didon, like some others of his order, is a great advocate of the reconcilement, where possible, of the Church with the modern spirit. These sermons are spirited and sometimes eloquent; but, as is the wont of their kind, somewhat deficient in argumentative force, and especially in attention to the arguments of the other side. Père Didon is particularly weak in dealing with (or rather in avoiding) the great contention of M. Naquet's partisans, that the marriage tie, though nominally indissoluble in France, is worn more loosely there than in any other country.

M. Hovelacque's lecture on secular and religious instruction (17) has at least the merit of being outspoken. The author thinks Christian morality and teaching bad in themselves, and says so. Unfortunately for him, he does not write well or argue forcibly, so that his contribution is hardly likely to be welcome even to his own side.

Admiral Jurien de la Gravière's treatment, from the point of view of modern and professional seamanship, of the naval incidents recorded by Herodotus and Thucydides (18) is full of interest, but would have been better if it had been cut down to half the length. A good many rhetorical ornaments could be spared, and the recounting of much miscellaneous history is also superfluous. If these things were struck out, an essay of moderate bulk would remain which would be equally welcome to students of antiquity and to those who care for antiquity only in so far as it bears on the present. The Admiral's indication of the points in which modern naval warfare is reverting to something like the conditions of the oldest maritime tactics known, though not exactly novel, is worth attention.

The sixth volume of M. Louis Blanc's *Dix ans de l'histoire d'Angleterre* (19) is less interesting than some of its forerunners. The abortive Reform Bill of 1866, the Austro-Prussian war of the same year, and the agitation of the Jamaica Committee, are M. Blanc's chief subjects, and the volume is less diversified than usual by comment on social and miscellaneous matters.

On the other hand, the third volume of *Le livre de bord* (20) fully maintains its interest. The heads of each chapter are full of attraction to those who are familiar with the French literary history of the last half-century, and the contents will prove excellent reading, whether the reader be provided or not with this previous acquaintance. Lassailly, one of the least known, but not least gifted, of the second division of romanticists, Mme. de Girardin, her husband, Emile Deschamps, Pradier, Gerard de Nerval—this list is only a selection of the names concerning whose owners M. Karr gives all kinds of quaint gossip, almost always amusing, sometimes pathetic, and, let it be added, not often other than good-natured. The odd history of Lassailly is perhaps the most characteristic of the batch. This Bohemian, in the proper sense of the term, was once seized by Balzac with a view to the appalling process which in Balzac's language was called collaboration, and found himself after a time simply obliged to fly for his life. Latterly he spent all the money he earned in opera tickets that he might at a distance worship an unknown beauty. There is also a great deal of space devoted to Victor Hugo in the volume, and not a few of the facts or assertions will be useful to the composer of M. Hugo's biography when the day—let us hope still distant—comes for the discharge of that difficult task.

George Sand's memory has not been much served by the republication of her *Souvenirs of* 1848 (21). They are mostly articles in the author's "preaching" style, destitute of incident or fact, and hardly of much value even to the historian. We may except a charming pair of letters between a workman who has been left in Paris and his wife who has fled to her parents in the country. Besides these *Souvenirs*, the volume contains a large number of short prefatory notices contributed to books which are hardly in any one case remembered or worth remembering.

The "little citizen" of M. Jules Simon's book (22) is treated somewhat after the same fashion as Masters Sandford and Merton, and instructed as to the theory of civil marriage, the principles of '89, the processes of the code, and the importance of not marrying till you can keep a family, by an excellent godfather. It is a harmless little book, though it occasionally approaches what Mr. Carlyle used to call a "dull-snuffling" tone.

The letters of Mme. de Gérando (23), friend of Mme. Recamier, Mme. de Staël, &c., and wife of a sufficiently well-known husband, exhibit the writer in an amiable light, but are somewhat deficient in incident and attraction.

Yet another collection of Gautier's scattered newspaper articles has appeared (24); and, like its forerunners, it is welcome. Most of the contents of the volume come from a long defunct periodical called *La charte de* 1830; and, as the only known file of this perished during the Commune, the collection is believed to be still far from complete. There is the widest diversity of subject, though in all the papers the "gold powder" which, as M. Karr says, Théophile Gautier used to scatter over everything that he treated, is apparent. An amusing piece of exaggeration, entitled "Au bord de l'océan," may perhaps be specially mentioned. Some literary notices, reprinted from Crepet's excellent *Poètes français*, are of a higher order, but they are also much better known.

Henry Gréville's "Sketches" (25) are short stories, mostly dealing with Russian subjects, and therefore of the author's best and most welcome brand. The first, a pathetic legend of death poisoning, and the last but one, an amusing story of a practical joke played upon a rather dangerous butt—the Emperor Nicholas—are perhaps the best. Nearly all, however, are well enough suited to fill up a spare ten minutes, though they are not exactly masterpieces. *Le château des épines* (26) is a novel of strong situations. It begins with what looks like a murder, and ends with what is a great hardship inflicted by the operation of the French code—that code in which some authorities would have us see the perfection of justice and mercy. M. Ulbach would perhaps have done more wisely if he had adopted situations a little less strong, but his novel is by no means without merit. We do not know that we can say the same of the tales of M. Paul Alexis (27). M. Alexis is a fervent admirer of M. Zola, and he prefaces his book with a tribute to his model, and a profession of the strictest naturalist faith. It is therefore not surprising to find in his work nothing above the level of newspaper reporting (with a preference for subjects which in England are not usually reported), and a total absence of humour, sense of proportion, and most other literary merits. Fortunately M. Assollant (28) has not forgotten that he is a Frenchman, and that therefore neither a belief in naturalism nor in anything else authorizes him to be dull. *Hyacinthe* is a very amusing picture of provincial life, perfectly natural if not naturalist, and agreeably destitute of the slightest intention to support or attack any theory of morals or literature. Perhaps one ought to be a little grateful to M. Zola and his school for the feeling of delight experienced in shutting their books, and passing to some author who does not think that the ideal writer is he who has the impudence to write what few people would have the impudence to say.

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,272, Vol. 49. March 13, 1880. [Registered for Transmission abroad.] Price 6d.

THE DISSOLUTION.

THE sudden announcement of an immediate dissolution was a great but a pleasant surprise. The House of Commons and the country were equally glad that suspense was at an end, and that the fate of members and of parties was to be decided in a month. The contest will be serious and severe, and when there is to be a fight, civilians, like soldiers, burn to have it fought at once. The lines of battle have been drawn up, and the generals have issued the usual words of encouragement and guidance before the first shot is fired. At the moment when the constituencies learnt that there was to be a general election, they had before them the manifesto of Lord BEACONSFIELD. Being in the secret of the dissolution, he could easily get the start of all the world, and he could determine from the outset what should be the issues to be decided and what should be the aims of the combatants. Nothing that Lord BEACONSFIELD can write or say can harm him at all or hurt Conservatives very much. His language is his own, and it has long been recognized that he may speak either as a novelist or a politician as he pleases. His followers echo his sentiments with a conviction that they must somehow be audaciously clever, and will some day appear to be the exact sentiments which ordinary Conservatives unconsciously held. If they do not understand his language, they can admire it; and they have a feeling of satisfaction in the thought, which is indisputably just, that no one in the whole world could have written anything like this manifesto. If it is to be criticized as the mere address of a party leader, nothing could seem more pompous, inaccurate, pretentious, and misleading. It is so conceived by its author as to supply his opponents with an obvious and effective reply on each point that is touched on. Regarded as a statement of the Conservative case, it may be safely pronounced the worst statement that could have been made. It concentrates the attention of the electors on Home Rule and foreign affairs, and it couples the real danger of the Irish movement with a purely imaginary design to alienate and break up the colonies; while it makes the goal of English policy abroad to be the ascendency of England in Europe. Far from desiring to alienate and repel the colonies, the very basis of Home Rule is the desire that the experiment so happily tried in Canada should be repeated for the benefit of Ireland. If it is intended to suggest that Liberals are the secret friends of Home Rulers, no means of adding a sting to the suggestion could have been less felicitous than that of hinting that the enemies of the colonies are those who, by granting free institutions to the colonies and by inventing the system of federation, have bound the colonies by new ties to the mother-country. Ascendency in Europe is dangerous to any Power, and, fortunately, impossible for England. It was gained for a time by LOUIS NAPOLEON, and is now enjoyed by Prince BISMARCK; but no manifesto will persuade Englishmen to wish to secure for themselves what they deplore when possessed by others. All ascendency is invariably described by its possessors as exclusively held for pacific purposes. The Empire of Peace was the dictum of LOUIS NAPOLEON at the beginning of his reign, and Prince BISMARCK is never tired of explaining to the German people that he thinks of nothing but self-defence. Acting as an equal, England may do much in the Councils of Europe to ensure peace, or to see that unavoidable wars do not hurt her. But the ascendency which would enable England to decree that no war, just or unjust, should be fought in Europe could only be obtained by a series of wars so successful that England would command peace through having no one left to fight with. If there could be an unkind and, as most people would think, an utterly unjust aspersion of ordinary Conservatives, it would be that their foreign policy was a policy of ascendency. But, however much he may soar into the regions of mystery and nonsense, Lord BEACONSFIELD may be safely assumed always to write with a purpose. He must have had some object in writing as he has done, and in order to appreciate the objects of his manifesto, it must be kept in mind that he was composing an electioneering address. To discredit the Liberals he may have thought it insufficient to denounce Home Rulers as traitors. But if there was a dark conspiracy to be suggested as going on in some unknown and remote part of the world, who could tell but that the confused minds of electors might believe that all the opponents of Lord BEACONSFIELD were engaged in it? The conspiracy was imaginary; but it is a sound electioneering maxim that, if enough dirt is thrown, some will stick. Then there are also some electors who, without troubling themselves to consider what the ascendency of England in Europe may mean, would think it something very fine and grand; while Lord BEACONSFIELD could trust that any apprehensions which his language might excite would be calmed down by the tamer and more sensible addresses of his colleagues, and that few persons would seriously believe that Sir STAFFORD NORTHCOTE or Mr. CROSS would engage in a dangerous and ruinous hunt after ascendency.

To the manifesto of the PREMIER the leaders of the three sections of his opponents have not delayed making a reply. The Home Rulers have no connexion as such with the Liberal party, but they are among the opponents of Lord BEACONSFIELD, and his manifesto seems to have had the effect of making their opposition to Lord BEACONSFIELD more determined and resolute than it hitherto has been. Mr. SHAW evidently wrote his address in a moment of what seemed to him just indignation. He bitterly resented the misrepresentations of which he thought Lord BEACONSFIELD had been guilty. The Home Rulers are accused of wishing to dismember the Empire, whereas in Mr. SHAW's eyes they are only seeking by constitutional means a constitutional object, with the purpose of binding the different parts of the Empire more closely together. No Government has done less for Ireland than the present Government; and Mr. SHAW finds it as easy to forget the Irish Education Bills as to ignore obstruction. Perhaps the most noticeable part of the address is that in which Mr. SHAW seems to associate himself and the more moderate Home Rulers more closely with the agitators for a redistribution of Irish landed property than has hitherto been the case. Mr. GLADSTONE also has issued his address to his admirers in Midlothian; and as a composition it has all the merits in which the manifesto of Lord BEACONSFIELD is so deficient. It is not much more than a laboured denunciation of everything the Ministry has done, from the day when it entered office to the moment when Sir STAFFORD NORTHCOTE had produced his Budget. But it is clear, vigorous, and flowing. Mr. GLADSTONE passes from point to point with the art of a practised critic, and every point adds something to the whole. It is needless to criti-

cize it, for to criticize it is to repeat the criticisms which Mr. GLADSTONE'S orations for the last three years have provoked; but no one can doubt that Mr. GLADSTONE believes what he says, and what he wishes to bring home to the electors is brought home to them with singular effectiveness. Lord HARTINGTON had a much more difficult task before him. He had to define the position and determine the action of a great party. He had to consider, not how to formulate the aims of Irish outsiders, or to get up the longest string of charges against a Ministry, but on what lines he is to lead the Opposition in a new Parliament, or to take office if office should before long come within his grasp. He has succeeded so well in the discharge of his task; his address is so broad in scope, and so well judged in details, that those who did not know have wondered with unfounded suspicion whether he really wrote it himself. It seems contrary to the chances of life that the son of a Duke should have penned a manifesto so statesmanlike, so telling, and pervaded by the signs of so much discrimination and tact. Lord HARTINGTON of course writes as a Whig. He cannot in an electioneering address be perfectly fair to his opponents. He has to lay down general Liberal principles, and this he does very explicitly, but with studied moderation. He has had the courage to say that he does not think that ranting at Home Rulers is the true way to govern Ireland. His Irish policy may be right or wrong, but at any rate it is a policy to which the most moderate of his followers may conscientiously adhere. It is founded on three simple propositions—that all wild proposals for an independent Irish Parliament must be steadily resisted; that measures for the extension of local self-government must be such as can be extended to all the three kingdoms; and that Irishmen must in all respects be treated by Englishmen as Englishmen treat themselves. The foreign policy of Lord HARTINGTON is again the old Whig policy; the policy, more or less, of Lord PALMERSTON and Lord RUSSELL. Its cardinal principles are that England should take an active part, but only as an equal, in the councils of Europe; that all aggression touching England should be firmly resisted; that wars should be avoided when possible; but that, when perturbations arise, England should take, to the utmost possible extent compatible with the preservation of her own interests, the side of the free or the oppressed. Excepting perhaps in the latter point, and there only to a small extent, we do not see that there is much difference between the foreign policy of Lord HARTINGTON and that of moderate Conservatives. It is of course opposed altogether to the policy of hunting after ascendency, but that is rather a whim of Lord BEACONSFIELD'S than a serious motive of party action. Finally, Lord HARTINGTON has distinct measures to suggest which he wishes his party to try to carry. The list is not a very thrilling one, but at any rate it relieves its author from the imputation of having nothing to propose.

The last duty of the Government before the dissolution was to introduce the Budget and obtain the sanction of Parliament to it. The position of Sir STAFFORD NORTHCOTE was not an enviable one. There was a great shortcoming in the revenue of the financial year now drawing to its close, as compared with its estimated yield. This deficiency amounted to no less a sum than 2,195,000*l.* It has been caused by the general badness of trade, and by a deplorably bad harvest. The people have been less well off, and have therefore drunk less. There has been a decrease of 800,000*l.* in the Customs receipts on spirits, a decrease in the Excise receipts of 800,000*l.* on spirits, and of 940,000*l.* on malt. The diminution of receipts from drink thus more than accounts for the total deficit. Times now are better, and with better times and a fairly good harvest, Sir STAFFORD NORTHCOTE calculates that the people will gradually resume their normal amount of drinking. He does not think that, even with a general election to help them, they will drink quite so much at present as they would drink in good times. But there will be, it is hoped, a perceptible augmentation of prosperity and drink, and the revenue for the coming year is taken at 700,000*l.* more than that of the present year. This is, as Sir STAFFORD NORTHCOTE justly said, a most moderate computation, and would balance the estimated ordinary expenditure. But then it is not only the ordinary expenditure and receipts that have to be taken into account. The country spent six millions on the settlement of the Eastern Question and six millions on the South African war. Of these twelve millions we still owe eight. Of the eight millions two are to be kept as part of the floating debt, and the other six are to be paid off by short terminable annuities expiring in five years' time. The annual charge for these annuities will be 1,400,000*l.*, and Sir STAFFORD NORTHCOTE proposes to get the money partly by an increase of the Probate duties, and partly by dipping into his own sacred Sinking Fund, and stopping the machinery for hastening the extinction of the National Debt. He thus hopes to avoid at once the reproach of leaving the burden of small wars to posterity, and the alienation of taxpayers who might not like to have new taxes imposed on them. They will not, it is thought, much care for the interests of the dead or the integrity of a Sinking Fund. As we are on the eve of an appeal to the constituencies, the Budget, therefore, is not badly devised, although it must have cost Sir STAFFORD NORTHCOTE something to abandon his own pet project, and to have himself to verify the predictions of the critics who suggested that the Sinking Fund would only go on until some Chancellor of the Exchequer wanted money, and thought it would be very convenient to dip his hands into it.

PREPARING FOR THE ELECTIONS.

AS soon as the announcement of the impending dissolution was made, preparations for the elections began. Members rushed off to the telegraph office and fought to get to the clerks. Agents were set to work, and when day dawned the adroitest machinery was in full play. To secure all the vehicles and all the public-houses, or at least to leave opponents with nothing but a donkey cart and a beershop, became at once the feats and the tests of electioneering ability. Candidates whose constituencies are of that peculiar kind that to be out of sight for an hour is to be dead set off to perorate, to guide or be guided, and to pay. How much will be spent in the constituencies in the next three weeks no one knows or ever will know, but it is safe to compute that the total will be nearer two millions than one. To have to contribute even a modest amount to this grand total is disagreeable to many, if not to most, candidates; but candidates have, as a rule, to go through worse things than spending money with the chance of spending it in vain. The physical strain on candidates is enormous, and the mental strain is often greater. A candidate has the anxious question to consider what it is that will secure victory in his particular constituency. Many voters—perhaps for the credit of Parliament it may be said the majority of voters—vote on public grounds. In Ireland and Scotland, beyond doubt, the majority of electors vote on such public grounds as commend themselves to Scotch and Irish voters. In England there is much voting on public grounds, but also much voting that can scarcely be called voting on any but small private grounds. First of all, there is the immense beer interest, which sways innumerable votes. Second in importance among the obscure causes of local defeats or victories is the ingrained habit of regarding elections as games in which each party wants to win for the mere sake of winning. The calamities and perversity of Turkey, the vicissitudes of finance, the peril of war, or the instability of peace, are merely the paraphernalia of the game. The real thing is to humiliate the man in the next street. Then, again, there are purely local influences. One candidate is a large employer of labour in the district, another lives in the place and gives dinner-parties, frequent, splendid, and, according to provincial ideas, good. And then the personal qualities of the candidate have some effect. It is some advantage to be able to speak well. If electors do not hope that their candidate will speak like Mr. GLADSTONE, neither do they endure without a pang of pain that he should speak like Lord MANDEVILLE. Any kind of political, professional, or social eminence tells a little—not much perhaps, but still there is always a percentage of voters who feel themselves to be gaining a faint and reflected credit when they vote for a Cabinet Minister, a general, or a lord. All these things have to be attentively considered by a candidate, and to think of them by day and dream of them by night is very hard work.

The most various calculations as to the result of the elections are current, and no one really knows how they will go. On the last two occasions of a general election the Government of the day entirely miscalculated the effect of a dissolution. If Governments may be so

deceived, how can private persons hope to calculate rightly? Nothing can be done except to sum up the advantages with which each party starts. The Conservatives start with the publicans on their side—an advantage so great that no other single advantage can rival it. Then they have the squires and the clergy, both important, and deservedly important, forces in English rural life. Their candidates, too, as a rule, are men of higher social standing, and, if not richer, are supported by much more handsome party contributions. In the special circumstances of the time they have also the advantage that there are many voters who, even if they do not think the foreign policy of the Government anything very grand or majestic, yet think it better than that of their opponents, who feel some fear and much dislike of the Home Rulers, or who ponder over the composition of the Liberal party, and see no use in helping to bring in a Ministry which could not last for a quarter of a year. On the other hand, the Liberals have some very considerable advantages. Nothing can make up to them for having lost the publicans; but still they have many elements of strength. They have the Nonconformists with them, and all those who dislike squires or clergymen. They have the memory of great services to appeal to. They have had the best literature of the country on their side for thirty years. They have in Lord Hartington a leader who during the last few years has gained more in public esteem than any other rising politician. Their cause is associated, rather vaguely perhaps, but still it is associated, with the cause of civilization, of progress, and of sympathy with the oppressed throughout the world. Their thoughts are in harmony with the ordinary and permanent thoughts of the bulk of English-speaking communities. Then the Liberals have been out of office for some time. Their errors and follies have been condoned or forgotten, and, as all Governments must disappoint many people, the legion of the disappointed will turn affectionately to those who may do more, and cannot do less, for them. Then at the last general election it was the Liberals who were the sufferers. They have many unexpected defeats to retrieve, and the fiercest spirit of party zeal will animate them in their desperate efforts to get back at any cost their Alsaces and Lorraines. Even crotchets may for the moment fade away under the overpowering influence of a desire for victory, and the divisions of the Liberals may be not so much healed as effaced by the ambition of success.

If we do not know who will win, we at any rate know that every seat that can be contested with the ghost of a chance will be contested. When we look through the long list of constituencies and candidates, it seems scarcely possible that there should be more contests than are now threatened, and yet it is certain that at the eleventh hour new struggles will be devised. It is scarcely possible that there should not be some Liberal gains in Scotland. The contest in Midlothian will absorb public attention, and the ingenious builders of flats must regret that they have taken so much trouble for nothing. But Mr. Gladstone will probably have Leeds to retire on, and an unsuccessful contest will only show that not even Mr. Gladstone can shake the supremacy of so deservedly popular a landowner as the Duke of Buccleuch. Dr. Playfair may have some trouble to retain his seat, in spite of his services and of his ability, as the passionate declamations of Mr. Gladstone may have alienated an educated constituency as much as they charmed the humble voters of Midlothian. Still the balance of gain in Scotland will probably rest with the Liberals. In Ireland the Home Rulers are literally standing in shoals. In Queen's County there are four Home Rule candidates, in Wexford County there are five, in Kildare and Kilkenny there are three. Every additional return of a Home Ruler is an embarrassment to Lord Hartington; but it is a diminution of Ministerial strength; and the general result of the Irish and Scotch elections may not improbably be that it will remain with the English constituencies to decide whether the Government is to have a working majority or not. With the exception of Lord Hartington himself, and possibly of Mr. Lowe, no member of the late or present Cabinet seems to have a serious contest before him. The distracted constituency of Stoke-on-Trent is perplexed by the rival pretensions of no fewer than six candidates; and Peterborough appears to be in an almost equal state of confusion. At Thirsk two Conservatives seem to be standing against each other, and at Northampton Mr. Bradlaugh adds himself as an outsider to the two Liberal candidates; but it is remarkable in how very few constituencies either party is throwing away its strength by intestine divisions. This, of course, specially affects the Liberals, as it was they who have suffered almost exclusively by those divisions in the past. The Liberals seem more united than they have been for years. Those who agreed with and those who differed from the foreign policy of Mr. Gladstone have fallen on each other's necks, and Mr. Cowen more particularly is pronounced to have the entire confidence of those who most differ from him. The quality of the candidates remains unchanged on the Conservative side, except that more young barristers of promise appear to be Conservatives than used to be the case. On the Liberal side there is not much change, but what change there is seems to be for the better. It is at least some comfort to the Liberals of Southwark that they will now have an opportunity of voting for Mr. Cohen instead of for Mr. Dunn.

AFGHANISTAN.

THE relations of the Indian Government with Afghanistan are still unsatisfactory, though there is no reason for alarm. The success of the impending expedition against Ghuznee is confidently anticipated; and the enumeration of the English troops engaged in the various operations seems to prove the impossibility of serious resistance. The statement that there are more than fifty thousand men in the country or in the passes produces a double impression. It is well that the Government can without intolerable strain dispose of so considerable a force; but, on the other hand, the difficulty of the task is indicated by the exertion which is considered necessary. Although party invective and recrimination have perhaps not wholly worn themselves out, attention is now almost exclusively concentrated on military operations or on future political combinations. The latest considerable speech on the controversy which has now become obsolete was delivered a few days ago by Lord Lytton to his Council. It was natural that he should be anxious to reply to the Duke of Argyll and to Mr. Gladstone; and his answer was both forcible in argument and temperate in tone. If a Viceroy can properly make speeches, Lord Lytton spoke well; but, on the whole, even vicarious sovereigns should, as a rule, decline discussion. A great potentate, especially if his power is in a certain sense absolute, should not put himself on a level with assailants or critics. An argumentative defence is likely to provoke further attack, which may perhaps convince careless or prejudiced judges. Mr. Gladstone's financial inaccuracies had already been fully exposed; and the Duke of Argyll has in some degree defeated his own purpose by his unqualified denunciations of the policy which has been adopted. Lord Lytton could not foresee that soon after the publication of his speech Afghan policy would for some weeks be discussed at home exclusively with relation to the interests of parties. A victory or a misfortune occurring in March or April might possibly determine the event of a great political contest.

Lord Stratheden, who is not subject to official scruples or restrictions, has contributed little to the settlement of Afghan difficulties by causing, through his notice of motion, the publication of Shere Ali's letter to the Sultan, written in 1878. It was already known that the Ameer had long before resolved on breaking off the English alliance; and even if he could still be called to account, his feeble attempt to convert the Sultan to his new policy would scarcely have constituted an additional offence. The document, though it is no longer interesting, is so far amusing that it is evidently not original. The thoughts and the language are entirely European; and indeed the Ameer makes no attempt to disguise the source of the information which he communicates to the head of his religion. "I am convinced," he says, "by my frequent interviews with the Russian Envoy, who has been here some "time, that the Russians are always more honourable and "sincere than the English; that is why I think it my duty "to urge your Highness to abandon the English alliance, "and come to an understanding with the Russians." General Skobeleff could scarcely say less in behalf of his own nation and against the rivals who might soon become enemies; and he perhaps thought that the letter which he caused the Ameer to write might facilitate some intrigue

for the submission of the Turks to the enemy who was then encamped outside Constantinople. Of the comparative honour and sincerity of Russia and England SHERE ALI probably retained his own opinion, if indeed he judged of either nation by its moral virtues or defects. Perhaps the most important part of the letter is the date of January 1878. The Envoy had then been some time at Cabul; he remained there till the end of the following July; and when he retired, he in the first instance left the rest of the Mission behind him. During nearly the whole time the Indian Government took no hostile measures against the AMEER; and nothing can be more absurd than the reproaches which have been addressed to Lord LYTTON and the SECRETARY of STATE because they made no attempt at the time to cultivate friendly relations.

It has for some time past been thought desirable to open a way to co-operation with the only descendant of DOST MAHOMMED who is known to possess ability or influence. Several weeks have passed since ABDURRAHMAN was allowed or caused by the Russian authorities to retire from the residence where he had long lived under their protection, for the purpose of seeking his fortune in Afghanistan. It is not known whether General KAUFMANN provided him with funds for the purpose, though some calculations published in the Russian newspapers of the amount of savings which ABDURRAHMAN had made out of his allowance excited reasonable suspicion. From Tashkend he proceeded to Bokhara, where he appears to have been on friendly terms with the KHAN. His later movements have not been accurately known, but it was lately stated that he was still within Russian territory at Samarcand. According to another account, he has invited the Afghan Sirdars and chiefs, including JAN MAHOMMED, to meet him at a place in Afghan Turkestan, probably for the purpose of concerting measures against the English. If the rumour is confirmed, the proposed combination may perhaps be in some degree formidable. It is said that JAN MAHOMMED had previously sent emissaries to urge the different tribes to hold themselves ready for a sacred war. His sagacity was thought to be shown by his postponement of any gathering of the clans until all preparations were completed. If a numerous army was collected before the time had come for action, it would be exposed to internal jealousies and quarrels; and it may be added that, in the absence of commissariat arrangements, an Afghan army necessarily provokes irritation by living on the country. Whether it will at any time become prudent to encounter the English army in the field is a question which the enemy will have to consider. It is injudicious to calculate on success before it is achieved; but, if Sir F. ROBERTS or Sir DONALD STEWART is strong enough to take Ghuznee, it is scarcely probable that any Afghan leader will be able to assume the offensive. For the next seven or eight months nothing is to be apprehended from the severity of the climate; and all the passes, including the Shutargardan, will soon be open. There is little doubt that the unexpected attack on Cabul in the middle of December was encouraged by a belief, founded on the precedent of forty years ago, that an English army could not maintain itself at Cabul through the winter. The Afghans have never had experience of a victory over English troops when the weather was favourable to military operations.

If ABDURRAHMAN really proposes to put himself at the head of the national forces, he displays more courage than prudence. His relative and enemy, SHERE ALI, though he collected enormous military stores for the purpose of some eventual struggle, never ventured on a rupture till he was backed by the Russian Envoy, who may have been profuse in promises of aid. As soon as the English army began its advance to Cabul, SHERE ALI fled without an attempt at resistance; and after his death no Afghan leader offered serious resistance until JAN MAHOMMED attacked Cabul with overwhelming superiority of numbers. Even if ABDURRAHMAN should induce the majority of the chiefs to acknowledge his supremacy, Candahar will probably remain faithful to its English connexion; and the mutinous regiments which are incessantly fighting with one another at Herat will scarcely be at the disposal of a pretender who is not even in possession of Cabul. If ABDURRAHMAN could collect under his banner all the regular troops who were raised by SHERE ALI, he would, independently of the levies of the tribes, be inferior to the English in numbers, and still more in the quality of troops. There is no use in considering his military prospects, except so far as they are likely to affect his conduct. If he possesses the intelligence for which he has received credit, he will hesitate to engage in an unequal struggle, especially as victory, even if it were attainable, is not his only resource. It is highly improbable that he will be able to expel the army which now occupies a great part of Afghanistan; but it is not impossible that he may make advantageous terms for himself, if he can furnish sufficient guarantees of his future fidelity. None of his BARUCKZYE kindred have hitherto shown the ability or force of character which would enable them to maintain themselves if they were placed in power. It would be convenient to deal with a possible ally, even though he might have been an enemy. ABDURRAHMAN may perhaps be under engagements to Russia, but, if he were Ameer, he would rely on the protector who might in his estimation be most powerful. A comparatively strong and partially independent Afghanistan might after all be constituted if a strong ruler could be found.

THE SENATE AND THE SEVENTH CLAUSE.

THE debate in the French Senate on the 7th Clause of the Education Bill fully redeemed the oratorical reputation of the Ministry. M. JULES FERRY made the speech which he had kept in reserve all through the general discussion of the Bill, and M. DE FREYCINET put on all his skill to undo the impression left by his colleague. No two things could well be more different than the 7th Clause as it was presented by the MINISTER of PUBLIC INSTRUCTION and the 7th Clause as presented by the PRIME MINISTER. They might have belonged to two distinct Bills, and have been brought forward by two distinct Cabinets. The arguments of the two speakers were as nearly as possible mutually destructive. Had they been addressed to the same section of the Chamber this might have been a tactical error; but, as they were really intended to influence two forms of political opinion which have nothing in common except a portion of their name, the divergence served its turn and offended no one. M. JULES FERRY'S speech could hardly have been meant to assist the passage of the clause. It was plainly addressed to men who needed no persuasion. The Advanced Left had forgiven the Government much because of the 7th Clause, and in voting for it they would only be giving effect to their own favourite ideas. The object of M. FERRY'S speech was probably of a personal kind. If the clause was accepted by the Senate, no harm would have been done. If the clause was rejected, and its author had to leave the Cabinet, very considerable good might have been done to M. FERRY himself. If he could count upon the support of the Advanced Left, he would stand in a much more favourable position than if he left office after attempting to make things pleasant to every one. M. FERRY'S future is irrevocably marked out by his antecedents. Unless he shall some day consent to do public penance, the author of the FERRY Bill cannot hope to make part of any Government which is not markedly Radical. Consequently he has everything to gain by recommending himself to the Advanced Left. Their support may be of the utmost value to him in the future, and their support is to be had if he will consent to pay the price asked for it. Judging by his speech, M. FERRY is quite willing to pay that price. He shrank from no extreme which could be supposed likely to please those whose favour he wished to gain. He defended the 7th Clause on the ground that the State has a right to say what a parent shall teach his child, and what he shall be forbidden to teach him. There are many thousands of parents at this moment in France who wish their children to be brought up by the Jesuits. They know what the Jesuits teach them, or they see what sort of men the children of other parents become under Jesuit teaching, and they approve of the result. There are many other French parents who wish their children to be brought up by atheists. They approve of the teaching given in their schools, and wish to put their children under their care. On M. FERRY'S theory the State has a right to forbid the Catholic parent to send his son to a Jesuit college, or to forbid the atheist parent to send his son to a secularist school. It is plain that no defence can be constructed on behalf of one of these prohibitions which shall not extend to the other. If the State is not going outside its province in closing a Jesuit school against the children of Ultramontane parents, it would not be going beyond its province if it closed a secularist school against the children of atheist

parents. It might be acting beneficially for the children, and therefore wisely for itself, in the one case, and injuriously to the children, and consequently unwisely for itself, in the other case, but the principle involved is the same in both instances. Prudently or imprudently, the State judges what is best for children to learn—determines, that is, whether it wishes them to be brought up as Ultramontanes or as secularists—and then sets to work to give effect to its choice. This is the theory of education which is now popular with the Advanced Left. They are not disturbed at being reminded that their policy is identical with that of the Ultramontanes. They take this rather as an argument in its favour. The Ultramontanes have at various times enjoyed a very large share of political power, and the Advanced Left are probably of opinion that, if they wish to attain the same result, they cannot do better than use the same means.

M. DE FREYCINET's speech was obviously intended to win votes to the clause. It was studiously conciliatory in tone, and animated throughout by a spirit of genuine moderation, which seemed strangely out of place considering the cause which he was defending. M. FERRY had done his utmost to magnify the clause; M. DE FREYCINET did all he could to minimize it. In the hands of M. FERRY it was an indispensable bulwark against a most serious danger; in the hands of the PRIME MINISTER it ceased to have any positive or immediate significance, and became simply a bulwark against the multiplication of religious orders to which the State had not been asked to extend its recognition. The adoption of the clause, said M. DE FREYCINET, would not be tantamount to the beginning of a crusade against the unrecognized orders; on the contrary, provided that they did nothing injurious to the State, they would be allowed to go on teaching much as before. M. DE FREYCINET hardly affected to deny that this way of regarding the clause made it a matter of very little moment whether it was passed or not. Or, rather, he hardly affected to deny that it was important to pass it, not because the Jesuits now constituted a public danger, but because they had constituted a public danger in 1877, and it seemed impossible to maintain the Government majority in the Chamber at its present strength unless the Radical section of it were conciliated by this trifling sacrifice. If, he said to the Left Centre, you were asked to vote against religion or against parental freedom, I could understand the excitement which the 7th Clause has created. Inasmuch as religion is not really assailed at all, and parents will be allowed to choose teachers for their children with scarcely more interference than at present, why should practical men like M. SIMON and M. DUFAURE insist on throwing the Liberal party into confusion by refusing to grant what nearly every Liberal demands, and what, if granted, will leave everything pretty much where it is?

M. DE FREYCINET's way of approaching the question bears some likeness to a process with which we are familiar in this country. Englishmen are constantly asked to vote for this or that measure on the ground that it can be so interpreted as to mean little or nothing. There is a sense, they are told, in which Home Rule is quite compatible with the unimpaired maintenance of the Union, a sense in which Local Option is quite distinct from the Permissive Bill. The answer to these representations is sufficiently simple. If this or that demand means no more than it is represented to mean, why is it so ardently desired? It is not conceivable that the Extreme Left should have worked themselves into a frenzy on behalf of the 7th Clause if they meant it to have no further result than the limitation of Jesuit schools to their present number. They were content to hear the Minister give this account of the measure because they thought it might make its success more probable; but, if the Senate had allowed itself to be persuaded by his politic assurances, the Extreme Left would never have rested until they had brought the administration of the clause into harmony with its plain sense.

The Senate has wisely determined to give the country some reason for the distribution of the work of legislation over two Chambers. Of course the rejection of the clause has already provoked a cry for an amendment of the Constitution which shall take the drag off the wheel, and allow the Extreme Left to drive the Republic to ruin at their own pace. Even if this demand were to be granted, the action of the Senate would be fully justified. A Second Chamber had better be abolished for doing its duty than for incapacity to do anything. If the Liberal Republicans in the Senate had voted for the 7th Clause, they would have done violence to their convictions, and proved their own impotence, by one and the same act. What are they there for, except to moderate the injudicious action of the popular Chamber? If they are not strong enough for this, they are not strong enough for the specific function with which they are charged. It is more probable, however, that many of the professed defenders of the clause are themselves relieved by its disappearance. Abuse of the Senate is a luxury that costs nothing, and involves no responsibilities.

SOUTH AFRICAN AFFAIRS.

IN one of the despatches which have lately been published relating to the affairs of South Africa, Sir M. H. BEACH indicates a disinclination to encourage the proceedings which have been instituted against the leaders of the malcontents in the Transvaal. While he professedly acknowledges the impossibility of tolerating open defiance of the English Government, he desires Sir GARNET WOLSELEY to deal leniently with offenders who, as he suggests, have acted under the pressure of an uninformed public opinion. It is not usual to excuse the leaders in a seditious movement on the ground that they were instigated to violence by their own followers. The opposite assumption, that the chiefs of a revolt are almost exclusively responsible, is generally both consistent with the facts and convenient for the purpose of asserting lawful authority. It may be that the rebellious attitude of the Boers is less morally culpable than ordinary instances of resistance to an established Government; but it is hardly the business of the COLONIAL SECRETARY to provide apologies for opponents who still maintain a hostile attitude. It is only when it prospers, and not when it may seem comparatively venial, that treason loses its name. Mr. PRETORIUS and Mr. BOK, who are under prosecution, have affected to withhold recognition from the actual Government of the Transvaal, and to recognize as still valid the credentials of the Assembly which represented the Dutch community before the annexation. Sir GARNET WOLSELEY would have displayed culpable weakness if he had declined a public and audacious challenge. Instead of waiting for the civil war which was threatened, he arrested the chief promoters of the movement, and it is to be regretted that his conduct should be but coldly approved, if indeed it is not by implication censured. There was no reason to fear that he or his successor would administer the law with undue severity; and, if necessary, a private hint might have been given without the inconvenience of reassuring the seditious party.

Some of the leading Boers have been guilty of a grievous crime as well as of technical contumacy. In a despatch published some time ago Sir GARNET WOLSELEY stated that persons whom he named had instigated the natives who were then in arms against the English forces to continue their resistance. There is reason to believe that the same faction had intrigued both with CETEWAYO and with SECOCOENI, the ancient enemy of their own race and of their former Government. The indulgence which might be due to the opponents of the annexation of the Transvaal is not to be extended to traitors of the worst kind who ally themselves with savages against European supremacy. Neither laws nor treaties are necessary to create the duty of defending against native aggression the rights of the superior race. Dutch subjects of the English Crown who conspire with Caffres or Zulus against the Government forfeit all claim to impunity and compassion. The strong language used by Sir GARNET WOLSELEY in denouncing their treason was not too severe for the occasion. He will probably keep his word by making any offenders of the kind whom he can catch acquainted with the hangman. Even if the former Republic had been still in existence, the commander of the English troops would have been justified in punishing the complicity of any part of the white population with barbarous enemies. The misconduct of the disloyal Boers seriously affects the question of the expediency of withdrawing from the Transvaal. The annexation was accomplished with friendly intentions, though the measure may have been unduly precipitate. One of the immediate objects contemplated by Sir THEOPHILUS SHEPSTONE was the protection of the inhabitants from SECOCOENI, who had recently defeated them in the field. The relations of all parties may, however, have been modified by the attempt to form an alliance with the Caffre chief. If the leaders of the Boers can be

induced to reconsider their threatened policy of resistance, it may be prudent to remain as far as possible officially ignorant of any criminal intentions which may have been formed; but it is necessary to make the offenders understand that henceforth similar outrages will not be perpetrated with impunity. It may be inferred from Sir GARNET WOLSELEY'S expressions that, if he had been able to seize the culprits, he would not have waited for instructions from home to punish their treachery.

If the Government had hesitated to retain possession of the Transvaal, they would perhaps have been deterred from restoring the independence of the province by the increasing probability of a South African federation. Sir BARTLE FRERE, though some of his acts have caused just dissatisfaction at home, appears to have discovered more completely than his predecessors the secret of obtaining the confidence of the colonists. Through his influence a Ministry favourable both to the English connexion and to the union of the South African colonies and States has now held office for two years with the apparent approval of the community. The Government of the Cape has proposed to take preliminary steps towards a federation; and, although there may perhaps be difficulties in the adjustment of competing claims to representation, the minor provinces will probably at once accept the principle of union. If the dissatisfied portion of the inhabitants of the Transvaal wish for a pretext for desisting from a hopeless struggle, the opportunity of joining a Confederacy may perhaps be represented as preferable to direct submission to the authority of England. The Cape, which must always be the most powerful member of the proposed union, contains a large population of Dutch origin. It is remarkable that during the late controversy no pressure has been put on the Cape Legislature by constituencies which might have been expected to sympathize with the claims of the Transvaal. In a South African Confederacy including all the provinces the Dutch would at present form a majority, though the English settlers surpass them in commercial and political activity. The Orange Free State will for the present hold aloof from a Confederacy of the English settlements; but if the union is accomplished, and if it produces its expected results, the whole of South Africa will inevitably in course of time form a single dominion.

The example of the United States, since followed by Canada, furnishes the best illustration of the advantages of federation. If the former colonies, or some of them, had retained their original seclusion when they became independent of the English Crown, they would, like European States, have been further separated by tariffs and Customs Houses, and they would have been liable to the risk of war. The unity which was first created for purposes of external security has in innumerable ways promoted the general prosperity, and it has been the foundation of national greatness. The Australian colonies, which have learned by experience the evils of conflicting commercial legislation, will sooner or later throw down the barriers by which they are still divided. In South Africa there is a motive for union which scarcely exists in Canada, and not at all in Australia. Although the wars of the last two years have put an end to immediate risk of native hostilities, all the provinces are liable to be drawn into collision with warlike tribes spreading in unknown numbers far into the interior of the continent. A common system of defence and a uniform native policy will furnish the best security from attack. The native difficulty adds one to the many complications of the question of the Transvaal. The great majority of the inhabitants of the province are natives, who are liable to oppression by the Dutch farmers. Before the annexation the English Government may not have been directly or indirectly responsible for the condition of the native residents in a foreign and independent State; but the natives of the Transvaal have now for a time been English subjects, and they are therefore entitled to protection. There is no reason to suppose that legislation which will probably be founded on the law and practice of the Cape will be unjust to any class of the community. The Imperial Government has for some years recommended confederation for sufficient reasons in the interest of the colonies. It has only so far a selfish motive for promoting a sound policy, that it justly desires relief from the burden of native wars. Now that the Zulu power is broken, a Federal Government of South Africa would be able to defend itself against any aggression. As the objections of the Cape, which was comparatively safe from attack, appear to have been overcome, the minor provinces will be well advised in seizing the occasion. It seems to be a proof of the increasing popularity of the measure that the Committee which professes to represent the Transvaal malcontents has offered to join in a confederation. The proposal may also perhaps imply a disposition to modify the demand for total independence. According to late accounts, Mr. KRUGER has lately used comparatively conciliatory language.

THE NAVY.

IT would not have been surprising if the speech of the FIRST LORD of the ADMIRALTY, in introducing the Estimates on Monday night, had been to some extent an electioneering address; but he emphatically denied that this was the case, and the statement made by him had indeed nothing of an electioneering character. There was no attempt to exaggerate what had been done at the Admiralty under the present Government, and no attempt to make too little of what his predecessors had done. The merits of candour and fairness may certainly be claimed for his speech, the moderate tone of which was praised even by such determined antagonists as Mr. REED and Mr. SHAW LEFEVRE. But unfortunately Mr. SMITH'S speech, however excellent in form, was by no means satisfactory in substance. He was indeed able to announce that a new and very powerful gun is to be introduced into the navy, and that the Naval Constructors of the Admiralty, with their usual unceasing ingenuity, have designed a vessel of a novel kind which will be fit for service at a time when the map of Europe may have been changed twice over; but, with the exception of this moderately reassuring news, the FIRST LORD had nothing to tell the House which might not have been anticipated from the Estimates, the meagre and insufficient nature of which we pointed out last week. He urged, of course, that the reductions he had made were not excessive, and, to meet the charge of not building ships enough, he used one argument which, coming from a less grave and serious speaker, would have provoked laughter. On the whole, a very weak case was made out for the Admiralty by the FIRST LORD, and, justly enough, his critics did not spare him. Some mistakes they made from that want of fairness which seems to be nowadays the ineradicable fault of Liberals; but their principal strictures had considerable weight nevertheless, and they succeeded in making it only too clear that, while other navies are rapidly advancing, the British navy is standing still.

The FIRST LORD strove of course to prove that all probable contingencies had been taken into account, and that a fair rate of progress was maintained; but, in order to make a plausible defence, he was obliged to ignore some very grave facts which have of late been pointed out and are becoming patent to all dispassionate people. He was aided in so doing by one of those circumstances which occasionally help Ministers in distress. Before the House went into Committee of Supply there was a short discussion on naval affairs, in the course of which one member thought fit to allege that the discipline of the navy was in a bad state. In replying with just indignation to this charge, which appears to be utterly unfounded, Mr. SMITH had deservedly with him the sympathy of the House, and this was no doubt of advantage to him when he was answering other charges of a very different nature. Among the first criticisms to which he replied was one which was made in our columns. We pointed out that the manner in which he was reducing the number of boys in the service must inevitably impair the future efficiency of the navy, inasmuch as vessels of war can only be fitly manned by those who have been trained in the navy from their youth. Last year the total number of boys on board men-of-war and training-ships was reduced by 1,000, and Mr. SMITH now proposes to make a further reduction of 400, which will bring the number on board training-ships down to 2,200. In justification of this reduction he said that it had been calculated that a force of 18,000 blue-jackets was required for the service, and that 2,200 boys would be more than sufficient to make up what he termed the "waste" that annually occurs with this number of seamen. This is a singular example of that plausible but unwise economy which has so often led Ministers astray. The navy can only be recruited from a specially trained class of young men, and

it is clear that the number of these should always be greatly in excess of the *minimum* which is sufficient to fill up the ranks in time of peace. In the event of war there would probably be the most urgent need for a large increase in the force of blue-jackets within a comparatively short space of time; but such an increase would be absolutely impossible unless there had been many more boys trained than were likely to be wanted during time of peace. It is true that by keeping the strength of them above what, according to a strict calculation, are peace requirements, some expenditure is incurred which might be dispensed with; but the sum thus saved is astonishingly small, while the security gained is of incalculable value. In order to effect what is really a trumpery saving, the power which this country should possess of rapidly augmenting its navy afloat is to be sensibly diminished. It would be almost as reasonable to break up a large proportion of the vessels not now in commission on the ground that the total number of ships is above that required when the country is not at war.

Another and very serious objection to the Estimates has been based on the small amount of shipbuilding which is to be executed during the financial year. In treating this, the FIRST LORD followed exactly the opposite course to that which he had pursued when defending the reduction just mentioned, and, altogether abandoning the present, he scanned the far future. The unsleeping designers of the Admiralty have invented a new type for men-of-war, which may be regarded as an improvement on the *Téméraire*, and it has been decided to lay down one, perhaps two vessels of this kind. The new ship will have "two fixed armour towers, "with two 43-ton breechloading guns revolving within "each of them, and a battery of breechloading guns "capable of piercing armour between them." Her speed will be fifteen knots; a considerable portion of her waterline will be protected by armour of enormous strength. No doubt this will be a very formidable war vessel, and probably the discussions about her and her guns, which may be expected to take place in the Parliament after next, will possess considerable interest; but at present Mr. SMITH seems rather premature in holding forth on her merits. Only a small sum is to be spent on her this year, and, at the present rate of construction of ironclads, six or seven years—peaceable years, let it be hoped—may be expected to pass before she is finished. Her possible good qualities therefore are hardly likely to console those who reflect on the troubled state of affairs which the PRIME MINISTER's letter so clearly indicates for the scantiness of the additions to be made to the navy during the next twelve months. On this subject the FIRST LORD had of course something to say, and he brought forward an argument in defence of comparative sluggishness which was perhaps one of the strangest ever presented to Parliament. "If they built ships more "rapidly," he said, "they might find them useless in "fifteen or twenty years. As invention went on, we "should have an extreme difficulty to contend against "if we went on increasing the number of our ships." This statement is undoubtedly true, and would carry great weight if it were possible to look forward to a time when invention will have come to an end, and if foreign Powers would obligingly agree not to do anything calculated to cause war until after the arrival of that blissful period, due allowance being then made for the time necessary for the construction of a perfect ship. As, however, a navy must be ready to defend the country in case of war, and as unfortunately Governments do not give two or three years' notice of their intention to declare war, but, on the contrary, sometimes begin hostilities with the most indecent disregard for the convenience of their adversaries, it is unfortunately necessary that ships should be begun, continued, and completed, even at the risk of their proving obsolete after a certain time. Just at present there appears to be, not owing to any want of administrative energy or ability at the Admiralty, but to an exaggerated desire for economy, a strong tendency to dawdle, and to exceed even the long periods hitherto required for the construction of great men-of-war; and it would be much better to refer this procrastination to its true cause, for which the Admiralty is not exclusively responsible, than to resort to arguments according to which it would always be impolitic to build ships, seeing that, by the time they are finished, some one may have devised a plan of building better ones.

With respect to the imperious necessity which has now arisen for protecting the large supplies of food required for the support of the people Mr. SMITH said nothing, and in this he did well, for any attempt to prove that we possess sufficient means for guarding against the danger which would threaten these supplies in case of war would only have exposed him to a crushing reply. He did indeed refer to the possibility of arming merchant-vessels, and said that "the Government could avail itself of the services "of ten, twenty, or thirty fast ships, which could rapidly be "armed and used as cruisers, though, as they would probably be larger and more vulnerable than the enemy's "regular unarmoured cruisers, they would probably have "the chances against them in an engagement." Such an auxiliary fleet might possibly prove to be of much value; but it is to be remembered that its use would be an absolutely new experiment, and that the experiment might fail. Whether any of the great merchant steamers could be rapidly turned into men-of-war, capable of meeting the war-vessels of other nations, seems doubtful, as it appears by no means certain that they might not be sent to the bottom by a few shots. Mr. SMITH's reservation is therefore full of meaning, and shows that the authorities at Whitehall are not over-confident as to the result to be obtained by taking merchantmen into the navy in time of war.

As was to be expected, his critics, with such an opportunity, made a vigorous attack upon him; but, not content to rely on what was really a strong case, they injured the effect of their onslaught by exaggeration and want of fairness. Mr. REED complained justly of the huge time now taken in constructing ironclads, but ignored the fact that he was himself in part responsible for the delay which occurred in the building of the *Inflexible*, the *Ajax*, and the *Agamemnon*. Mr. SHAW LEFEVRE complained of the small number of ironclads built since the present Government had been in office, but entirely overlooked the work which has been done in repairing ships and keeping them efficient, to which Mr. GOSCHEN, who defended Mr. SMITH a great deal better than Mr. SMITH defended himself, had to draw attention. "There were," said this very straightforward member of the late Administration, "two distinct "policies which a First Lord could adopt—one the repair-"ing, the other the building, of ships. Now the right "honourable gentleman opposite had adopted the former, "and the result was the complaints as to the paucity of the "ships he was building. . . . The late Government fol-"lowed a different course. They concentrated a great deal "of their attention on building, and were in consequence "abused for not having repaired sufficiently.". The real difficulty in regard to the navy could hardly be better indicated than it is in this terse statement. That the Admiralty must be able both to repair and to build ships, if the supremacy of the British navy is to be maintained, is too obvious to need comment. To do this, however, much larger sums are required than have been hitherto given; but no Government seems willing to put this disagreeable fact plainly before the country. All that can be done is done with the money voted; but that is not enough, and Ministers are afraid to ask for more. It would be hard, indeed, to hold one member of the Cabinet responsible for a desire for economy which seems to be very generally felt; but it certainly seems strange that the FIRST LORD of the ADMIRALTY should be explaining how he is going to reduce expenditure, and to place the navy on a peace footing, at a time when the PRIME MINISTER is proclaiming the necessity of maintaining the ascendency of England in the councils of Europe.

THE REACTION IN VICTORIA.

THE Parliamentary and Ministerial change which has taken place in the colony of Victoria ought to satisfy more than one class of politicians at home. Those who wish to see English institutions spread as widely as possible over the world have nevertheless regretted the impossibility of transplanting to the colonies the social and political conditions which affect the distribution of power in the mother-country. In a new settlement, where all the inhabitants are virtually equal, universal suffrage is not only just, but inevitable. In the United States it has gradually superseded the more complicated system of a colonial period. In Australia it has been regarded as a necessary condition of the constitutional experiment which bears the name of responsible government.

The colony of New South Wales has administered its public affairs with prudence and moderation; but the adjacent province of Victoria has for several years been in great measure governed by revolutionary demagogues of an especially obnoxious type. The origin of the agitation was the real or supposed conflict of interests between the large landowners and the rest of the community. It was necessary to regulate the possession of land, and up to a certain point the legislation on the subject was not essentially unjust; but unfortunately the controversy produced a schism between the owners of property and the mass of the community, and colonial politicians learned to think that the main object of legislation was to redress the inequalities of fortune. The labouring classes were taught to regard their own special interests as the sole object of political action; and producers took the opportunity of allying themselves with those whom they employed for the establishment of commercial monopoly. The absolute control of legislation by the leaders of the majority was checked by the action of the Council which divided constitutional authority with the Assembly. Almost from the first establishment of responsible government, the two branches of the Legislature have been at variance, and several years ago they came to an open rupture on the subject of a grossly irregular grant made by the Assembly to an ex-Governor whom the majority regarded with some reason as a partisan of their own.

A more habitual ground of contention was the pretension of the Assembly to withdraw all financial measures from the control of the Council. It was admitted that, in accordance with English precedent, the Upper House could not amend money Bills; but the Council claimed the power which belongs to the House of Lords of rejecting them. There was no reason why the discussion should result in a quarrel; but Mr. Berry, the late Minister, was bent on depriving the Council of all independent authority. On several occasions he tacked general enactments to money Bills, with the knowledge, and probably with the intent, that they would be rejected by the Council. He appealed, not without success, to the prejudices of the Assembly and the mass of the people against the alleged usurpation of the Council; and on all occasions he contrived to defeat schemes of compromise. He also refused to acquiesce in proposals for reforms in the constitution of the Council which might perhaps have increased its influence. A body consisting of lawyers, auctioneers, merchants, and others of the same rank was denounced as a selfish aristocracy, and the official demagogues loudly demanded constitutional changes which would have vested all power primarily in the Assembly, and eventually in the constituencies themselves.

At the beginning of last year Mr. Berry induced the Assembly to make the liberal grant of 5,000*l.* for the expenses of himself and a member of the Assembly, who were to proceed to England, as delegates, to confer with the Imperial Government. Mr. Berry's colleague, Mr. Pearson, having during a colonial residence of a few years apparently denuded himself of English predilections, had, not long before his mission, proposed to tax the owners of property for the purpose of providing remunerative employment to labourers. The emissaries laid before the Colonial Secretary an audacious project for the reform of the Council and for the submission of disputed measures to a popular vote or plebiscite. The new Council was to be appointed by the actual Ministers, who would of course have composed it exclusively of their own partisans. Sir M. H. Beach was not ignorant that Mr. Berry and his colleagues in the Ministry had repeatedly threatened secession or armed rebellion. He had also received from a large section of the respectable classes protests against changes in the Constitution which would leave property at the mercy of the numerical majority. The dominant party had already imposed a tax on property beyond a certain amount, for the avowed object of producing artificial subdivision. The Colonial Secretary judiciously declined to consider the schemes which were proposed, on the ground that the resources of colonial legislation were not exhausted. It was satisfactory to have the opportunity of exhibiting a deeper respect for the principle of responsible government than that which was felt or affected by its professed champions.

On his return to Victoria Mr. Berry at once renewed his offensive policy; but he found, to his surprise and disappointment, that his factious extravagance had provoked a reaction. The colonists were at the same time beginning to learn that the classes which had obtained protection as consumers themselves in turn suffered from its effects when it was applied to the raw materials which they used and to articles of general consumption. The coachmakers, while they cherished their own monopoly, objected to protective duties on springs, on tires, and on panels; and the farmers desired to be relieved from the artificial cost of all the manufactured products which they required. A dissolution, forced upon the Ministry by the diminution of their majority in the Assembly, has happily resulted in a victory for the Opposition. Mr. Service, who succeeds Mr. Berry as principal Minister, has taken a principal part in resisting his attacks on the Council. The others are little known in England. The negative advantages of the change are great and undeniable. It is well for the colony to have even for a time got rid of Mr. Berry and of Sir Bryan O'Loghlen, who as Attorney-General gave legal sanction to all the most outrageous proceedings of the late Government, while he almost surpassed Mr. Berry himself in violence of language. On one occasion the Attorney-General talked of sending by force on board ship the Governor of the colony, who had in vain deferred to the most extravagant demands of his Ministers.

The apologists of democracy may congratulate themselves on the temporary or permanent removal of one of the most effective arguments against the system which they defend. For some years the Victorian Ministers have discharged the function of the drunken Helots of universal suffrage. Their violence, their ignorance, and their shameless injustice illustrated all the defects of government by numbers. It is satisfactory to find that the exposure has at last produced disgust and repentance. Although a majority may sometimes be as tyrannical as a single despot, it is itself, as democratic theorists have acutely remarked, in an actual or possible state of internal change. The particles which compose the majority are in a state of flux; and the minority may in some cases become the majority in turn. The change, indeed, may never occur; but the victims of oppression have the consolation of knowing that relief is always possible. It has yet to be seen whether the new Ministry of Victoria will be able or willing to alter the perverse economic policy which has been carried to greater excess there than in any other civilized country; but the socialistic projects of Mr. Berry, and of Mr. Pearson who was not a Minister, will be at least interrupted. There can be little doubt that Mr. Service will profit by his friendly relations with the Council to effect a permanent readjustment of the relations between the two branches of the Legislature. The Council has never claimed in theory an equal share in financial legislation; but it may in some cases have strained the analogies which it draws from the English Parliamentary Constitution. An elected Colonial Council has not the influence and authority of the House of Lords, and still less can it rival the hereditary tact and prudence which have survived innumerable changes in the distribution of power. The Imperial Government will, if its consent is necessary, readily approve and facilitate any reasonable compromise which may obviate future collisions. If the Assembly renounces the pretension of a right to tack legislative measures to financial Bills, the Council may properly disclaim any interference with taxation and expenditure. The nominal privilege of rejecting a money Bill as a whole can only remain in the text of the Constitution on the understanding that it is never to be practically exercised.

THE INDIAN LAW COMMISSION.

THE codification of the Indian law is unquestionably the most interesting experiment in legislation which modern history presents. The enormous area affected, and the strange diversities of race, religion, social development, and general circumstances, among the two hundred millions of people with whom the Indian Legislature is concerned, are in themselves sufficient to invest the task with more than ordinary importance. The fact that a hundred and forty millions of British subjects are Hindoos, living under a system of personal law which has its roots in the very earliest forms of human society, invests the local customs and traditional rules of India

with deep significance to the philosophic statesman. Happily for the sake of science, the appointment of Sir H. MAINE to the post of Legal Member of Council brought to bear the full force of an intellect of the highest order upon all the varied and curious problems involved in the juxtaposition of primitive law with the exigencies of modern civilization. His researches, and still more his admirable utilization of the researches of less thoughtful observers than himself, have shown how enormous an addition to our knowledge of the primitive world and of the development of all those conditions which constitute civilization is to be found in scientific study of the growth of Indian law. He pointed out, moreover, that one effect of the introduction of settled and efficient government was the paralysis of those powers by which, at earlier stages of its history, society provides, in the growth of custom, rules of conduct binding on all its members; and that the distinct and peremptory language of statutory enactment necessarily results in arresting the gradual process by which, so long as a community is governed by customary laws, it unconsciously moulds them into harmony with the new feelings, beliefs, and wants to which the progress of civilization gives rise. This was conspicuously the case in British India. Hindu law, it is certain, had been from quite immemorial times in a state of flux. Even the half-mythical MENU recognizes a general departure from the strict standard of the primitive faith, and legislates for a world which has fallen away hopelessly from original righteousness. Every subsequent century has brought some new variation, and at present there is no province in India in which the prevalent law does not embody some more or less complete modification of the ancient Brahminical institutions. At the same time, close contact with modern civilization has forced into notice innumerable matters which lay altogether beyond the area covered by the ancient law, and for which it was necessary to provide by express enactment. Thus the British Government found itself confronted with a legislative task of unexampled magnitude and importance, partly necessitated by the internal changes in the structure of native life and society, and partly by the external influences of European civilization.

The duties thus imposed on the Legislature have been, upon the whole, courageously and skilfully discharged. Lord CORNWALLIS in 1793 conferred on the people of India the inestimable boon of a system of definite rights distinctly enunciated and legally enforceable by a proscribed procedure, instead of the almost "pure despotism" of preceding *régimes*. The laws promulgated under this system were termed "Regulations," owing to a lawyer's doubts as to the competence of the Indian authorities to infringe on the legislative powers of the English Parliament, or to modify the "laws and customs" by which it had been decreed that the various nationalities of India were to be governed. Successive Charters and Acts cleared away all uncertainty on this point, and considerable portions of the law have been gradually reduced to the systematic arrangement and exact language of a code. The earlier Regulations, which were often little more than loosely worded administrative orders, have been replaced in numerous instances by precise and methodical enactments. Lord MACAULAY and his colleagues, in their first great instalment—the Penal Code—held out to subsequent legislators an almost perfect example of simplicity, lucidity, and common sense. In later times, the procedure of the Courts, civil and criminal, has been embodied in similarly constructed enactments. The laws of Contract and Evidence have undergone the same process; so, again, have the law of Limitation and the various administrative measures under which the daily life, so to speak, of a State is carried on. Altogether, if the existing Acts, which are to a large extent fashioned on the model of the best-drawn modern English statutes, were arranged on an intelligible system, instead of merely in chronological order, a Code of very considerable pretensions to completeness would be found to be already in existence. There are, however, still many important topics for which it is desirable to provide. The personal law of Hindus and that of Mahommedans still remain distinct, so far as such subjects as religion, inheritance, marriage, adoption, and other personal and family relations are concerned; nor, perhaps, would it be desirable to bring to bear upon these great bodies of ancient customary law the searching process of codification. Some things are best managed by being left alone, and the vagueness and indistinctness of a custom sometimes indicate that it is dying slowly out under influences with which it would be undesirable to interfere. But in other parts of the great domain of social life the Government cannot properly abstain from solving difficulties to which its own presence and action have given rise; and the determination to give a Civil Code to India is among the settled principles of the Government which are understood to have passed beyond the stage of discussion. The only doubt has been as to the manner in which the process of codification can be most conveniently completed. The Law Commission, which for many years secured the co-operation of several distinguished lawyers in England, was excessively costly, and did not prove altogether successful; it was ultimately allowed to become practically obsolete. On the other hand, the most recent proposals of the Indian Legislative Department have not met with such public acceptance as to admit of the Government assuming the responsibility of passing them into law. Under these circumstances, it was resolved a year ago to associate with the present Legal Member two of the ablest of the Indian judges, and to await the results of their inquiries both as to the merits of several proposed enactments and as to the possibility of a general scheme of codification.

The Report submitted by these gentlemen gives evidence of thoughtfulness and erudition, and will no doubt be of material assistance to the Government in determining the course of action which it will, with reference to the many conflicting interests concerned, be most expedient to adopt in completing the Indian Code. With their leading recommendations, and the somewhat over-subtle arguments by which they are supported, few persons, we should think, will feel inclined to disagree. The Commissioners advise that the process of codifying well-marked divisions of the substantive law should continue; that the eventual combination of these divisions in a general Code should be borne in mind; that the English law, with the necessary modifications, should be made the basis of the future Code; that, in recasting the materials of English law, due regard should be had to native habits and modes of thought; that the propositions of the Codes should be broad, simple, and readily intelligible; that the desire of uniformity in legislation should not be allowed to exclude the considerate treatment of local customs; that preparation should be made for a systematic chapter on interpretation; and that the proposal for framing a digest of the decisions of the Indian Courts should be abandoned.

The Commissioners also submit amended drafts of several Bills which they think should forthwith be passed. One of these refers to the transfer of property, leases, mortgages, and, generally, contracts affecting immovable property; another to trusts; a third to negotiable instruments; others to alluvion, master and servant, and easements. When these subjects have been provided for, the Commissioners recommend the codification of the law of Wrongs, a subject, which, curiously enough, none of the numerous authors of Indian legislation have as yet essayed to throw into systematic form. The consequence is that, if one Hindu assaults or libels another, his consequent liability will be tested by the principles, not themselves always especially distinct, by which the English Courts are governed on these subjects—a *reductio ad absurdum*, of which long usage has perhaps in some degree veiled the full significance. The arguments with which the Commissioners enforce the postponement of the codification of this subject do not appear to us altogether convincing. It is, of course, true in one sense that, as "wrongs" are correlative to rights, it is impossible to deal with the former till the latter have been clearly ascertained and accurately defined. But, on the other hand, the ordinary rights the infringement of which constitutes a legal "injury" are sufficiently understood, and the practical inconvenience involved in leaving so elementary a chapter of law in an obscure and unsettled state would justify a departure from a strictly scientific order of subjects. On the same grounds we should deprecate the proposal to postpone the codification of the law of interpretation, which would naturally occupy the position of a preliminary chapter to the Code, and which certainly ought to be settled before the language of the law is allowed to be coloured by meanings of which it may hereafter be difficult to get rid. These, however, and a host of other questions, will have to be settled before the Government of India is likely to commit itself

to so ambitious a scheme of legislation. The general characteristic of the proposed enactments, so far as we are able to judge, appears to be a somewhat over-nice exactness, a too constant endeavour to translate into abstract language the subtleties and refinements of English case-law, and an occasional forgetfulness of that excellent maxim of Lord MANSFIELD, that "our jurisprudence should "be bottomed on plain, broad principles, such as not only "judges can without difficulty apply to the cases that "occur, but as those whose rights are to be decided upon "by them, can understand." Whether or not, however, the suggestions of the Commissioners be accepted, their Report will prove a valuable addition to the existing stock of knowledge as to a subject about which Englishmen, as a rule, think and know a great deal too little.

LOCAL OPTION.

THE advocates of local option have enjoyed this week a proud distinction over their fellows. Other men know that their special crazes are one and all forgotten in the excitement of a dissolution. For the moment hardly any one cares very much about the CLAIMANT or about the Vaccination Bill. Here and there there may be a constituency in which these questions have some slight influence on the result of the contest, but they are absolutely without interest for the great majority of the electors. It is not so with local option. Hundreds of candidates are at this moment pondering what answers they will give to the questions which Sir WILFRID LAWSON'S henchmen will ask them during the coming weeks, and how their prospects will be affected by the estimate formed of their answers. All over the country there are large sections of voters who are as keenly and as exclusively concerned about local option as they were this day week. Last Saturday they tore open their newspapers to see what had been said about it in the House of Commons the preceding night; to-day they will tear open their newspapers to read what is said about it in the addresses or the speeches of those who solicit their vote and interest at the coming election. Whatever else Sir WILFRID LAWSON has done, he has succeeded in making the lives of many actual and prospective members of Parliament a burden to their possessors. He has devised a formula so elastic that there is no escape from it short of positive rejection. In the comparatively happy days when his name was only associated with the Permissive Bill a candidate had some chance. He could fall back upon the eternal and convenient distinction between principles and methods of giving effect to them, and could plead that, though he was not prepared to vote for Sir WILFRID LAWSON'S Bill, he was somehow quite at one with Sir WILFRID LAWSON. Of course this did not always succeed. When the Lawsonites were very strong or very enthusiastic, they insisted on more than this amount of agreement. But very often it did succeed. A candidate who professed himself ready to vote, not indeed for the Permissive Bill, but for some other Bill which should approach the same end by other methods, was accepted as the best that could be had—the more readily that the more clear-sighted supporters of the Permissive Bill knew very well that, if once the control of the liquor trade were entrusted to the ratepayers, it would be impossible in the end to limit the use they should make of this control. Now the compliant candidate has no refuge left him. He is simply asked to pledge himself to a compromise which is in fact identical with that on the back of which he has ridden off so triumphantly in times past. But a compromise suggested by himself and a compromise suggested by Sir WILFRID LAWSON are very different things. Only the partisans of the Permissive Bill cared to inquire into the meaning of the former, and they had often good reason for not pushing the investigation too far. The latter takes hold of that large body of electors who, either by instinct or conviction, have assured themselves that anything which Sir WILFRID LAWSON says will content him is sure to be the Permissive Bill under another name.

This last class of persons will not be made the fewer by the turn which last week's debate took. If there had been any doubt as to the meaning attached to local option by the patentee of the phrase, there could be none after Sir WILFRID LAWSON'S speech. The argument on which he laid most stress was that his object was simply to give the ratepayers the power of closing public-houses which is already possessed by landlords. Lord ZETLAND, he said, has put a stop to the drink traffic at Grangemouth. "I only "want four-fifths of the ratepayers, where there is not a "landlord like Lord ZETLAND, to have the same power as "Lord ZETLAND has." The power which Lord ZETLAND has is a power to put a stop to the drink traffic in a particular town, and what Lord ZETLAND has in one town Sir WILFRID wishes the ratepayers everywhere to have in their several towns and villages. It can hardly be supposed that agitators who have such precise notions of what it is that they want will be content with something quite different, so long as it goes by the same name. To have a voice in the licensing of public-houses will only make the ratepayers partakers in the sin of selling liquor if they are forbidden to shut up public-houses altogether. To give local option while stopping short of the Permissive Bill would be like leaving a patient to doctor himself, on condition that he took his pill every other night and his draught twice a day, instead of taking his pill every night and his draught three times a day. If he is fit to regulate his own treatment, he must be fit to decide when he may dispense with drugs altogether. In point of fact, local option, in the limited sense which those who have unwillingly swallowed the formula wish to give it, would involve a more deliberate recognition of the liquor traffic than has ever yet been obtained from Parliament. How are the ratepayers, once invested with the right of regulating the number of public-houses, to be prevented from decreeing that there shall be none at all? Only by an Act of Parliament assigning a certain number of public-houses to a specific area or a specific population. In other words, Parliament must for the first time enact that, whether the magistrates like it or not, and whether the landowner likes it or not, there must be a public-house, say, to every thousand persons or to every square mile of ground. Without this, local option in its possible results is indistinguishable from the Permissive Bill. With this, all that the advocates of local option will have succeeded in doing will be to make Parliament tenfold more the child of the licensed victuallers than it is already. The happiness of the candidate who accepts local option in this latter sense will be exceedingly shortlived. He will certainly find, after he has voted for allowing the ratepayers to regulate, but forbidding them to put an end to, the liquor traffic, that he is in worse odour with the supporters he has worked so hard to retain than if he had been plain-spoken with them from the first.

It is needless to say that opposition to local option implies—except to Mr. GLADSTONE—no contentment with the existing licensing system. Indeed the most satisfactory symptom in the recent debate was the evidence afforded that the hope of seeing the experiment of free-trade in liquor tried under more favourable conditions, and for a longer time, than at Liverpool, need not be altogether abandoned. Lord HARTINGTON is of opinion that "there "is very much to be said in favour of that principle, sub-"ject only to Excise and police regulations," and a shade of regret may be detected in Mr. GLADSTONE'S speech that the course of recent legislation should have been in direct contrariety to the Report of the Select Committee of 1854—a Committee, as he was careful to remind the House, which consisted of members of great and proved impartiality, and possessing a very full acquaintance with the subject. Sir WILFRID LAWSON paid the principle of free-trade in liquor the undesigned compliment of misrepresenting its history. It was because, he said, of the failure of that principle that the country had had to resort to a restrictive system. The true account of the matter is that the principle has never been properly tried—never tried, that is to say, in combination with a full recognition by the magistrates of the need of enforcing stringent police regulations. The trial which is alleged to have been made of it in Liverpool proved nothing against the principle. The old system was restored, not because Free-trade had failed, but because the narrow majority on the Town Council which had resolved to try it was replaced by a narrow majority resolved that it should not be tried. The best contribution that could be made to the solution of the drink difficulty would be a determination on the part of some energetic local authority to repeat the Liverpool experiment.

LEO XIII. AND THOMAS AQUINAS.

THE reception accorded last Sunday by Pope Leo XIII. in the Sala Ducale of the Vatican to some four thousand "doctors of philosophy and cultivators and encouragers of science, assembled at Rome from all parts of the world," must have presented a picturesque and impressive spectacle. The Latin address read by Mgr. Triperi, "Hymnographer to the Congregation of Rites," whatever precisely that may mean, with the reply of his Holiness in the same language, lasting some twenty minutes and interrupted by constant bursts of enthusiastic applause, the time occupied in kissing hands and presenting offerings of books, and the solemn benediction at the close, could not fail to make on those who were present a vivid impression which they are not likely soon to forget. And that impression would be heightened by contrast in the minds of such of them as had been accustomed to witness the very different kind of pageants enacted on gala days at the Vatican under the predecessor of Leo. An assemblage of four thousand *savans* collected to hear a panegyric on sound philosophy and learning and a strong exhortation to cultivate natural science is scarcely an idea that would have commended itself to the mind of Pius IX. But it is not only nor chiefly as an imposing spectacle that the reception of last Sunday must be regarded, if we would estimate its true significance. Mere theatrical display is as little to the taste of the present Pope as it was entirely congenial to the last. This public gathering at the Vatican was the result of an Encyclical issued last year in which his Holiness urged the renewed study of St. Thomas Aquinas, in place of the modern text-books which had generally superseded it in clerical education. And it was unquestionably with a serious purpose that in his address the other day the Pope "dwelt on the importance of the philosophy of St. Thomas Aquinas, and especially on its great utility as a means of combating the scepticism of the present century," and "pointed out that it was not opposed to the progress of natural science." He went further and "strongly exhorted" his hearers "to cultivate natural science, but in a Christian spirit." This, by the way, is not quite the same thing as exhorting them, according to the gloss of the *Times*, which is not at all borne out by the language of the Encyclical, "to cultivate it in the nineteenth century in humble accordance with the methods adopted by the Angelic Doctor in the thirteenth," meaning apparently that they should adopt deductive instead of inductive methods. Such a suggestion would be almost unmeaning. It was not indeed, as the *Times* proceeds to admit, against inductive philosophy that Aquinas fought, because—to cite the same accurate authority—it "had not yet been invented." Induction, we need hardly say, forms just as integral a part of the *Organon* of Aristotle as of the *Novum Organum* of Bacon; the speciality of the latter, as his latest editor, Mr. Fowler, has justly pointed out, was not to "invent" Induction, but to propound "a new method of Induction," which should not simply accumulate instances, but arrange and utilize them on legitimate and rational principles. Of this method Aquinas was inevitably ignorant, and there is nothing to show that his ignorance of it is what the Pope desired to commend. But the notion is so widely prevalent that he in particular and the Schoolmen in general were mere slavish and unreasoning chroniclers of the *dicta* of an infallible Church, that it may be worth while to inquire a little more closely into their real place in the history of thought. Even the *Times* allows that no professor of natural science in our own day could be more candid and honest in his dialectic than Aquinas, and that he always put his opponents' case as strongly as his own. The writer adds that, if the universities and seminaries to which Pope Leo appeals to accept St. Thomas as their patron would be as careful as he was to examine facts before drawing their conclusions, there would be no disadvantage in a renewed study of his works. It is only fair to infer from all that has hitherto appeared of his general tone of mind and disposition, as well as from the tone of the Encyclical itself, that Leo XIII. does really wish to encourage this candid and scientific temper in holding up Thomas Aquinas as a model for study and imitation.

Scholasticism is a phenomenon so strange and uncongenial to modern thinkers ordinarily, that they are tempted to turn aside from it with a shudder or a sneer; they seem to themselves to have passed from a world of realities into a world of fanciful abstractions, where the forms of language or of logic take the place of facts. The Scholastic philosophy attained its zenith in the thirteenth century, when history and criticism were almost unknown, when few understood any language but Latin or thought any other worth understanding, and when the entire circle of human knowledge was comprised within very narrow limits. But if scholasticism, as a very competent critic has observed, "seems separated from the rest of literature by an impassable barrier," that is only one side of the truth about it. Those vast tomes of the Schoolmen, as he further observes, not only bespeak an amount of literary toil rare in the most cultivated times, but give evidence of a precision of thought and a subtlety of logical analysis which may challenge comparison with the best works of the best ages of philosophy. It is not very easy to define what Scholasticism is, and there is really more force than at first sight appears in Haureau's seemingly tautologous definition, "Scholastic philosophy is the philosophy which was taught in the Schools." It is in fact the philosophy of the *scholæ*, or, in other words, that which created the universities of Europe and was in turn fostered by them. For in this respect, as well as in the subject-matter of what was taught, the rise of the new system effected what was nothing short of a revolution in mediæval Europe. The old cathedral and monastic schools, which had afforded a fair instruction in grammar, were deserted for the new universities, and the students who had before been scattered over a number of smaller schools were assembled at a few great centres, which at once led to a concentration of energy and a freedom of handling unknown in earlier times. Compared with the preceding ages the intellectual emancipation of the eleventh, and still more of the succeeding centuries, was marvellous, though the Schoolmen themselves bowed down before the authority not only of the Church, but of Aristotle, who became to them, as it has been said, "a kind of supplementary Father." They looked to authority for their premisses, and building, as they believed, on adamantine foundations, were fearless as to the conclusions and followed out their thoughts with a hardihood and exuberant ingenuity of what we might almost call rationalistic speculation which has perhaps never been surpassed. In the *Organon* of Aristotle they found an unrivalled method for prosecuting their inquiries. And there is this distinction between the theological controversies of the early and of the middle ages, that the former mainly concerned fundamental doctrines of the Christian faith such as the Trinity, the Incarnation, and the like, while the latter turned rather on the methods of the Divine operation—on such questions *e.g.* as the nature of the Atonement or of the Real Presence and the effects of sacramental grace. "The Fathers contended for the facts on which the faith is built, the Schoolmen for the ulterior questions which arise, upon the mode of the Divine action." Their unflinching belief in abstract principles was partly no doubt due to their ignorance of history; but if their system was narrow, it is fair to remember that something of narrowness is almost inseparable from that concentration of thought and purpose by which the highest victories of humanity have been achieved.

And now, if we turn from Scholasticism in general to Thomas Aquinas, "the most saintly of the learned, and the most learned of the saints," who was its leading representative, we shall find even a writer so little careful as Dean Milman to conceal his contempt for the whole system—of which he thinks "the sole result to posterity is barren amazement"—constrained to speak of him in terms of very high commendation. Aquinas, he tells us, was an intellectual theologian who approaches more nearly than most divines, or even than most philosophers, to pure embodied intellect, without polemical anger or ecclesiastical jealousies, with no fear of the consequences of any investigation, hardly hating heresy, and loving nothing but naked abstract truth. He reserves indeed its unassailable province to Church authority and tradition, but within the proper sphere of philosophy asserts full freedom, and will exempt no Father—not even St. Augustine—from critical examination; he is "eclectic" and independent in his judgments. Where his views are narrow, it is rather his age that is in fault than himself. It was almost inevitable, living when he did, that he should condemn all "usury," that is interest on money, as dishonest, and that he should justify the forcible repression of heresy, which he defends by arguments very like those used in a later age by Dr. Johnson. On the other hand, on some practical questions he is notably in advance of his age. He distinctly maintains the right of subjects to withhold or withdraw their allegiance from unjust or usurping rulers. And he no less distinctly lays down that the profession of an actor—which, according to a tradition long current in the Church, and often enforced by *ipso facto* excommunication, is unlawful—is not in itself unlawful or sinful, inasmuch as recreation is necessary to mankind. "*Officium histrionum, quod ordinatur ad solatium hominibus exhibendum, non est secundum se illicitum.*" Bossuet characteristically asserts that he is mistaken on both points. It must be remembered that Thomas was hardly forty-eight at the time of his death. The *Summa Theologiæ*, which was placed on a table by the side of the Bible at the Council of Trent, occupied the last nine years of his life. Readers of Dante, who assigns to the Angelic Doctor a sphere beyond the reach of praise, will not need to be reminded how largely it has influenced the composition of the *Divina Commedia*. But a more permanent interest perhaps attaches to his ethical than to his directly theological writings. Whether the principles of his theology are true or false is a question which can hardly affect our estimate of his personal greatness. That he must be reckoned, with Aristotle and St. Augustine, among the few master minds that have left their impress on the development of human thought is beyond question. As Bareille says, "He was indeed an extraordinary genius, whose power contemporary minds were constrained to recognize, whether they bruised themselves against his logic or submitted to his guidance; he ruled in both ways, but more by seconding than by checking the movements of his age." It is moreover a mistake to suppose that Aquinas, as the greatest of the Schoolmen, has only left his mark on that scheme of Catholic philosophy, or theology, whichever we please to term it, which they aspired to build up on the foundations of the earlier patristic teaching. Scholasticism has helped to shape the principal Confessions of the Reformation no less unmistakably than the decrees of Trent. Its traces may perhaps be less perceptible in the Thirty-nine Articles, which partake of the nature of a compromise, but the Schoolmen are largely responsible for the methods, however strongly they might repudiate the conclusions, of Calvin's Institutes and the Westminster Confession. It is not of course the relative truth of the rival systems formulated at the Reformation that Leo XIII. intended to determine by his recent Encyclical; for him and those

whom he addresses that is not an open question. He was not thinking of the doctrines to be learnt, but of the manner of learning them. And to be brought into contact with such a mind as that of Aquinas cannot but tend, like the study of Aristotle, to sharpen the intellectual faculties. Whether Latin theology is a legitimate development of the doctrine of the ancient Church or a corruption of it, is a point on which opinions will necessarily differ, but there can be little doubt that those who are bound to acquire a knowledge of it had better go direct to the fountain head in writers like Thomas Aquinas than imbibe the stream when discoloured by later infusions and filtrated through meaner intellects. Modern Roman theology is virtually the creation of the Jesuits, but Aquinas was born three centuries before Ignatius Loyola. When the Pope puts him forward as the model for theological and philosophical students, he is only so far reactionary that he is recalling them from a later to an earlier, and what all who are acquainted with the subject will know to be a purer and healthier, tradition of their Church.

THE TERRORS OF A GENERAL ELECTION.

THE approach of a general election must cause considerable mental anxiety to a body of men who are scarcely fitted by nature to bear any severe intellectual strain. The typical British legislator has often been exposed to ridicule; but in the present crisis he certainly deserves our sympathy. After an exceptionally long interval, he is suddenly called upon to play an unaccustomed part in public affairs, and to exchange the dignified ease of Westminster for the turbulent activity of the hustings. To the great mass of respectable members of the House of Commons such a change must be fraught with suffering. The honest and estimable gentlemen whose oratorical exercise has been strictly limited to cheers and groans, and whose punctual attendance in the division lobbies has placed them beyond reproach, are not necessarily endowed with the faculties required for a clear exposition of public policy. This is a task which in their capacity of members of Parliament they have wisely left to their leaders. It is rather too much to expect that a man who has honourably retired from business with a fortune sufficient to deserve the confidence of a large constituency should straightway apply himself to the arduous study of public affairs. Political life would upon such terms be scarcely worth living, and the House of Commons would cease to be reckoned as the pleasantest club in London. To undertake anything like a serious study of the science of government would be in truth to make a business of pleasure, and thus to deprive a Parliamentary career of the attractions which it now offers to those who have already exhausted their energies in the care of their own affairs. But, although this is undoubtedly true, it is a truth which is not sufficiently recognized by an exacting public. In the feeling of reverence which popularly attaches to our national institutions, we are apt to regard the members of the House of Commons as a body of trained and expert legislators who are profoundly conversant with the questions they are called upon to determine. Such a presumption is both misleading and unjust. It may perhaps be fair to require of a criminal that he should know the law, but it is absolutely unfair to expect the same knowledge of a legislator. Still less have we the right to demand that a member of Parliament should understand those larger and more complex questions which affect Imperial policy. It is bad enough that respectable men of domestic habits and advancing years should be compelled to absent themselves from home and to keep late hours. So much, however, they are willing to endure for their country's sake; but the claims of patriotism are unduly strained when we require that this self-sacrifice shall be in all cases associated with political intelligence.

On the eve of a general election these sound and sober views of the proper duties of a member of Parliament are perhaps apt to be forgotten. A popular prejudice inclines us to expect from the candidate something wholly different from what is required in the full-fledged legislator, and the desire to satisfy this expectation leads in many cases to acute suffering and disappointment. If it were not for the comfort that springs out of the sense of having companions in misfortune, the effort and anguish of such an epoch would scarcely be tolerable. For the first time in a period, perhaps, of seven years, the steady-going legislator has to provide himself with a set of coherent political opinions. Although he may have passed through a blameless Parliamentary career, voting punctually with his party, and enthusiastic in his support of the local water scheme, he is not allowed to escape from this burdensome intellectual exercise. By the strict conventions of his position he is bound to assume the attitude of a thinker, and to declare himself possessed of individual ideas. And by a still harder necessity he is pledged to try to find for these ideas a decent form of expression. Constituencies have become so unscrupulous as to demand information even upon questions of foreign policy. There was a time in the history of our country when it was enough for a politician to own a general distrust of the schemes of France, a sentiment which was at a later date exchanged for a manly contempt of Russia. But since those happy days no end of strange and uncouth names have blossomed upon the politician's map. Men past middle life, who want nothing more than a quiet seat on the back benches, are forced to enter upon a methodical study of geography; they must know what is meant by "a big Bulgaria," and be able to put their finger upon Cyprus, or to trace the course of Lord Beaconsfield's "scientific frontier." And if they wish to succeed they must perform such intellectual feats without any appearance of effort or distress. There are so many younger aspirants for political honours to whom these complex problems are comparatively familiar, that the mature candidate is now hardly pressed in the race, and unless he can make a fair show of understanding the questions of the hour, his prospects are gravely imperilled. His difficulties would not, however, be altogether insuperable if he were allowed to take his own time, and to deal with the subjects of political controversy after his own fashion. It seems, indeed, somewhat unfair that the politician should not be allowed to enjoy the kind of liberty that is granted to the popular preacher. The occupant of the pulpit is never harassed by an intrusive and vexatious curiosity. He can lavish upon his hearers all he knows without the fear of being asked for more, whereas the unfortunate candidate can never feel any assurance that his ignorance will be left undisturbed. To prepare for a general election is therefore even more difficult than to "cram" for a Civil Service Examination, for the public-spirited electors will admit no limitation of subject. Possibly when the arduous labours of statesmanship have come to be more clearly appreciated, some organized scheme of political examination will be charitably provided. Candidates will then be allowed to take up a certain number of subjects, and will not be exposed to inquiry upon matters outside the limits of their studies. The kind of political machinery that has been perfected at Birmingham and other large towns could be aptly applied to this end; and, besides selecting the fit person to represent the borough, the "Three Hundred" might draw up a list of political questions in which the candidate would be expected to show proficiency. Under such an arrangement the politician who had taken up Afghanistan as his special subject would not be required to answer any inquiries touching the Zulu war; nor would the philosopher who had lavished his intellectual resources upon the problems of the liquor traffic be liable to be embarrassed by impertinent questions as to local taxation. The statement of such a convenient arrangement must seem like a tantalizing dream to the crowds of unfortunate gentlemen who will shortly have to meet their constituencies. In place of this orderly method of examination, they will have to face and to endure an irregular process of torture trying alike to their conscience and to their intelligence. In the short interval that must now elapse before the hour of their trial, vast piles of unstudied Blue-books will rise in judgment against them. Their sleep will be constantly interrupted by visions of the rubicund publican and the pale-faced abstainer; they will see the Irish vote swiftly passing from their grasp, or will wake in conscience-stricken despair at the thought of having eaten unwisely of the forbidden fruit of Home Rule. It is in vain that they now turn their attention to the study of subjects too long neglected. The wasted autumn days passed in a country house when there was leisure enough to have ascertained the geographical position of the Euphrates Valley are remembered with many vain regrets. All opportunities of solid information have now passed beyond recall, and the little time that is still left scarcely suffices to determine the advantages of marrying a deceased wife's sister, or to settle the awful question of female suffrage.

But even if we charitably assume that the unfortunate candidate has made up his mind upon all these matters, his position nevertheless demands our warmest sympathies. In the bosom of his family he has to endure bitter reproaches for interrupting the serious business of society with his trivial political concerns. No sooner have his wife and daughters comfortably settled themselves down for the London season than they are recalled to the country to preside at electoral tea-parties and to listen to luminous expositions of Imperial policy. At such a moment the anxious mother will perhaps remind her husband that his career in Parliament has been something of a disappointment to the family. While he is straining every nerve to regain his seat, she will possibly suggest that the moment has arrived when he should carefully consider his fitness for public life, and she will calmly point out to him that, in spite of the undiminished confidence of his constituents, time is slipping away and the girls are still unmarried. To such arguments as these the leaders of the two great parties have supplied their followers with no sufficient answer. In a season of stagnant trade and diminished rentals, the feminine reasoning acquires a double force and urgency; for, if money is to be spent at all, surely his own flesh and blood have a higher claim than the Government or the Opposition. Harassed by these heartrending appeals from the domestic circle, the jaded candidate is apt to cut but a sorry figure before his constituents. After a few stormy meetings he begins himself to doubt whether he was ever intended by nature to take a prominent part in public affairs. A long silence in the House of Commons has led him to take an exaggerated estimate of his own oratorical powers; and he now realizes, almost with the sense of new discovery, that he is neither a lucid nor a fluent speaker. He finds to his disgust that he is scarcely a match even for the leader of the local debating society, and he is forced to endure the humiliation of listening to the cheers of the audience as this enthusiastic politician exposes the miserable incompetence of their candidate. The chairman of his committee is not unlikely to prove a yet further source of disappointment. For months past the friendship of this valued personage has been sedulously cultivated. He has been allowed to shoot the pheasants, and

he has been repeatedly invited to dinner, and yet, in spite of every precaution, he incontinently pledges his chief to some dangerous admission with regard to "local option" or the burial of Dissenters. The time and energy of the candidate are henceforth entirely absorbed in endeavouring to rectify the blunder of his lieutenant. At every meeting he is obliged to enter upon a long and tedious personal explanation, and before this is successfully completed he has forgotten the substance of a carefully prepared speech, and confused a mass of figures with a studied peroration concerning the responsibilities of empire and the beauty of freedom. For sufferings like these even success is but a poor recompense, and we suspect that if the House of Commons could be polled there would be found a number of worthy old gentlemen who would gladly follow the example of Cincinnatus, and exchange the business of government for the charms of rural life.

RURAL POSTMEN.

Among those victims of official economy who now and then share with Afghan assassins and other oppressed persons the sympathy of a tender-hearted public, rural postmen occupy what may be called a respectable position. The essentially commonplace nature of their sufferings must prevent them from ever creating such sensation as is excited by more heroic characters. They are not liable to be run over and mangled like railway porters, or to be dashed against casual projections like female athletes; but in the temporary absence of any more important objects of compassion, they are a sure and unfailing resource for philanthropists, professional and amateur. They resemble in one respect the article of female attire whose mention was so bitterly resented by Mrs. Wilfer; we "know they are there." We also know that they have to walk considerable distances and that their salaries are not large. On the occasion of a heavy fall of snow or rain it may be easily conceived that the post is not a comfortable one, and we may even presume that they sometimes catch cold in the execution of their duty. They are therefore a legitimate cause of "tears of compassion trembling on the eyelids" of friends of humanity, whose sympathy might perhaps be rudely withdrawn from them if, as in the case of the Needy Knife-grinder, they were subjected to the test of a personal interview. The work of a rural letter-carrier makes no very great demands upon the intellect, and, like the making of laws, and other useful and important functions, it requires no special training. All that is needed is a disposition to walk the necessary distance, and a character for common honesty. Unless, therefore, the principle of competitive examination—which might in this case take the form of a long-distance walking competition—were adopted in the selection of candidates, it would be difficult to prevent many incompetent persons from entering the profession. Those "wastrels," as they are commonly called in the North of England, who can never settle down to any regular trade, sometimes take up the work for a few weeks or months, until the monotony of their daily round begins to pall upon them, when they perhaps exchange it for tramping of a different kind, which, while it possesses the charm of variety, is not rewarded by any regular salary, and involves the necessity of frequently sleeping in the open air, together with other discomforts. It is seldom that country postmen belong to the class of agricultural labourers or other outdoor workers. Sometimes, indeed, the Squire gets the situation for a "handy man" who is no longer handy; but for the most part they seem to be men of sedentary occupation, who from various causes have sought employment in the open air late in life. Of those whom we have known, by far the greater part have been tailors or bootmakers, who often ply their trade in the evening when their walking is over. Still more frequently they have given it up because it has injured their health, and the doctor has ordered them more active employment. It thus happens that the office of letter-carrier is often undertaken by men whose constitution is already unsound, and the strain caused by exertion for which their previous way of life has rendered them unfit sometimes brings about a breakdown. If the death is sudden enough to involve an inquest, it is followed by an outburst of honest British indignation, somewhat akin to those periodical fits of morality which Macaulay ridiculed. The local and possibly also the London papers are inundated with letters on the inhuman treatment of Government servants, a member of the Statistical Society—who signs his name in full—calculates the pence and fractions of pence which the victim received for each mile that he walked, and men who grudge fourteen shillings a week to their own labourers are the first to inveigh against the wickedness which requites so much industry with a pittance of twenty. No doubt to walk twenty-five or thirty miles a day is tolerably severe work for ordinary persons, and puts a dangerous strain on weak hearts and diseased constitutions; but for a strong healthy man there are worse things than exposure to wind and rain, and even in such winters as we have experienced lately the number of days during which snow is on the ground is limited. The work is probably not much harder, and certainly is far less tiresome, than that of London postmen, while the pure air and pleasant scenery make the day's walk in fine weather absolutely enjoyable.

The position, too, is worth some slight sacrifice of comfort, for the postman in retired districts is an important personage; and his arrival is the great event of each day. He brings all the morning's news from the post town, a full account of the grand wedding which took place yesterday morning, and the concert last night; he knows the current price of corn, and whether there is a rise or fall in the egg and poultry market; and, in fact, acts as a daily supplement to the weekly newspaper. He takes a deep interest in the young ladies at the hall and the parson's daughter at the rectory; and has a keen eye for letters addressed to them in a masculine handwriting. He resents the institution of private letter-bags, rather on the ground of interference with his prerogative than of the additional trouble which they entail upon him. The squire finds him useful, because he always knows where wild duck are lying, and will undertake to put up a snipe which he marked down in a field close by. He is adored by the women servants, and hated by the footman, who finds him a dangerous rival in the housemaid's affections. Perhaps it is the thoroughly human character of his interests which prevents the postman from attaining to scientific fame such as has been sometimes gained by bakers and others of humble station. It is as well that it should be so, for trains and mail-carts can hardly be expected to wait while a studious postman is stopping to examine the geological formation of the country as manifested in a new railway cutting, or rushing across meadows in pursuit of a rare moth, or investigating the domestic habits of the common earth-worm; and a postmaster would scarcely be gratified if, on emptying the letter-bags, he found them in the condition of Mr. Blasenbalg's creel in *New Men and Old Acres*. Whatever the cause, we may be tolerably certain that no such student exists among postmen; for, if there were such a person, his life would long since have been made the subject of an instructive volume by the indefatigable Mr. Smiles. Perhaps their opportunities of close communion with nature, and their intercourse with all sorts and conditions of men, may suggest poetry as the study in which they are most likely to excel. They possess some, at least, of the qualifications pronounced necessary by the learned Imlac; and we may some day find "Poems on Post-cards; or, the Lucubrations of a Letter-Carrier" among the announcements in the publishers' column of the *Times*.

When the postman has a pony to help him on his way, the number and variety of the parcels which he can carry is truly astonishing. We have seen a man in the North of England ride into a village on a dun Iceland pony with a sack slung across the front of the saddle containing a couple of live ducks, whose heads, thrust through holes cut at each end, were now and then turned upwards with an expression quite pathetic, while they protested loudly against the irregular method of their conveyance. Two pairs of heavy boots hung down from behind, while the man himself had his letter-bags on one side, a huge parcel under the opposite arm, a net of lemons over his shoulder, and a leg of mutton balanced by some mysterious means on the saddle in front of him. It is scarcely to be wondered at if such a general benefactor occasionally suffers from the injudicious hospitality of his friends. Beer in warm weather and spirits in cold are often too freely bestowed in return for some specially interesting piece of news, or as payment of the carriage of a parcel, and towards the conclusion of his round the postman's gait is not always characterized by that steadiness and certainty which are desirable in a public functionary. He naturally resents any allusions to his infirmity, and we have known one to be so enraged by the insults of an irreverent chimney-sweep as to throw down his bags and challenge the mocker to fight. The timely intervention of two policemen rescued the bags from the gutter and their bearer from utter defeat. The difficulty which exists in some districts of getting men to undertake the work makes the authorities look kindly upon such slight irregularities. A fall by the roadside, followed by entire inability to rise again, has been charitably ascribed to sunstroke, without too careful an inquiry into the question whether the sun chanced to shine on that particular day; and a long-suffering postmaster once told us that, if any of his letter-carriers did not arrive at the proper time, he always sent a cart to pick the man out of the ditch and to collect any letters which might be lying about the road.

It sometimes happens that a rural letter-carrier is also the village postmaster, and in this case the business of the post-office is generally carried on by his wife. The office then becomes for the women of the village what the public-house is for the men, and Mrs. Mailsetter in the *Antiquary* is by no means the only postmistress who has got into trouble through anxiety to know all about the business of her neighbours. It would be interesting to know how many of these officials are dismissed every year for irregularities of this kind. Sometimes, no doubt, discretion gets the better of curiosity, and investigations are confined to the covers of letters, which afford ample material for speculation. A rapid succession of blue envelopes, directed in the cramped character of small tradesmen or the big round hand of a lawyer's clerk, may be the first indication of an approaching bankruptcy. Frequent letters addressed to a lady in a masculine hand will suggest an engagement not yet made public, and a scrutiny of the postmarks may sometimes serve to identify the happy man. The authorities of a country post-office may thus gain considerable insight into their neighbours' affairs by the indulgence of what they would no doubt regard as legitimate curiosity, and without overstepping the bounds of honesty; but there are times when this source of information fails. Perhaps a series of letters in an unknown hand, and with a postmark which conveys no distinct idea to the official mind, creates a mi-directed longing after truth. But as the culprit in this case has no inten-

tion of immediate confession, such rough-and-ready means of access to the desired knowledge would be dangerous, and the domestic appliances of every-day life suggest a far less clumsy alternative. The kettle singing on the hob has more uses than the innocent one of tea-making, and the jet of steam which issues from the spout is an excellent means of producing solution of continuity between the flap and the main body of an envelope, without leaving any distinct traces of its use. The letter, having been read, is carefully fastened up again and sent on. If there is any delay in its delivery, it is probably not noticed, or passed over with a grumble. The culprit, encouraged by a first success, grows more and more daring, and the spout of the tea-kettle comes into constant use. It is not in human nature that the intelligence thus discovered should be kept entirely secret. The desire of contributing something new to the stock of village gossip overpowers prudential considerations, and perhaps a neighbour is taken into confidence. More often, no doubt, the news is vaguely hinted at as something which has been heard from a friend at a distance, or been told by some one who has dropped in at the office—a stranger, of course. Gradually the whole village is set by the ears, and people begin to wonder how it is that their most private affairs are known all over the country side. Suspicion is thus aroused; but so long as the inquiring mind of the postmistress confines its investigations to the letters of her neighbours and equals, the chances of detection are very small. The rustic is slow to take action of any kind, and in such a case would certainly not know what kind of action to take. His notions of how letters come and go are of the vaguest, and he lives in utter ignorance of the existence of a Postmaster-General. Thus the emoluments of a rural postmastership may long continue to form a kind of "endowment of research," unless a stronger and more reckless curiosity impels the culprit to tamper with the letters of her social superiors. Then detection sooner or later is almost certain. The squire, after writing indignantly to his favourite journal on the subject of postal irregularities in general without producing any beneficial effects, bethinks him of writing to the authorities on his own particular case. Perhaps the spout of the kettle some day performs its functions inadequately, and necessitates the suppression of a letter, or a clumsy attempt to reproduce the original method of fastening it. Suspicion then becomes certainty, and just when the unconscious woman is gloating over some interesting details of family history or a specially tender passage in a love-letter, an official appears to pronounce sentence of dismissal, and to take charge of the office until a trustworthy person can be found in the neighbourhood. Meanwhile the ejected one is left to undergo the jeers of her offended neighbours, and a sermon from the rector on a text taken from the third chapter of the Book of Genesis.

MR. GLADSTONE'S NINE POINTS.

IT is not easy to calculate exactly whether the Government, before finally deciding on a dissolution, had before them the curious letter which Mr. Gladstone addressed at the end of last week to the *Scotsman*. Mr. Gladstone has been, naturally enough, inclined of late to communicate with the organs of public opinion chiefly read by those whom he hopes to make his constituents; and it is doubtless an additional attraction to him that the Scotch papers are free from the lamentable taint besetting London journalism. Otherwise it was almost unkind of him not to let the inhabitants of the unworthy city which happens to be the capital of Great Britain participate at once in the amusement he had in store for them. A document more characteristic of "the stern logician Gladstone"—as a French newspaper, with remarkable and ultra-Gallic felicity, has just described him—has hardly ever appeared, and it is an odd enough coincidence that he should, so to speak, "go to the country" upon it. Chronological and other reasons seem to acquit the Ministry of any malicious intention in the matter, but the coincidence, let it be once more repeated, is certainly a curious accident.

It seems that some time ago—indeed we have a more or less distinct remembrance of the fact—Mr. Gladstone solemnly contradicted twelve lies which were being circulated by wicked Tories respecting him. On this occasion he cannot muster more than nine untruths which require to be solemnly testified against. This of itself, to adopt for a moment his own style of criticism, throws serious doubt on the accuracy of his first paragraph. This paragraph states that, in Mr. Gladstone's opinion, "whatever may have been or may continue to be the depression of trade, the circulation of untruths and calumnies continues to be brisk." Now, by irresistible arithmetic, we find that the circulation of untruths and calumnies has diminished to the extent of 25 per cent., so that the preamble would seem to be not proven. Mr. Gladstone then states that "the practice of fabrication by some, leading to culpably careless adoption by others, is, as far as he knows, without precedent in political warfare"—a statement which shows a decidedly less intimate acquaintance with political history than we should have supposed him to possess. The interest of the epistle, however, lies characteristically in the postscript, wherein the nine articles of Tory calumny are solemnly marshalled in order that they be without qualification contradicted. It has been said, we are told, that it is Mr. Gladstone's intention to raise the question whether the exclusion of Roman Catholics from the throne is a political necessity; that he was a faggot voter for Midlothian; that he suggested the formation of the Civil Service Stores in lieu of an increase of salaries; that he sanctioned the exertions of an emissary from England to stimulate the war feeling in Russia; that he was connected with Gilbey and Co.; that he has announced an intention to withdraw the country from all its entangling engagements; that he was in office for sixteen years out of the twenty from 1856 to 1876; that during those years there was "no action, or protest, or otherwise" (*sic*), on behalf of the subject races of Turkey; and, lastly, that he has treated the connexion of the colonies with the mother-country as matter of indifference. All which positions Mr. Gladstone does solemnly and without qualification deny. The first thought that strikes a reader of this singular list will be the odd admixture of its component parts. The first, third, and fifth articles are wholly out of keeping with the other six, and require, one would have thought, either a wholly different kind of notice or no notice at all. It is quite possible that such allegations may have been made; it is quite certain that, if they have been made, they are not worth contradiction, and hardly worth attention. There have been times perhaps when voters could have been got to believe that Mr. Gladstone helped in altering the wine duties because he was interested in the importation of wine, and that Gladstone claret thus deserves its name in another sense than that generally received. But, if Mr. Gladstone really thinks that any voter of Midlothian would allow his vote to be decided by an idle tale of this kind, referring to a matter twenty years old and bearing on the face of it its own absurdity and falsehood, we should think that his best plan was not to court the suffrages of such a constituency. The charge about the Civil Service Stores is more fantastic, more ingenious, and much less vulgar. Unfortunately, however, it is a little too ingenious, though the victim might, had he a grain of that humour which is unfortunately absent from his composition, have adopted it as a tribute to his own financial ingenuity. The champion of retrenchment should surely not treat thus harshly a soft impeachment which opens up endless possibilities of economy. Who knows but that in the federation of the world to which some of Mr. Gladstone's friends look forward, all public salaries may be abolished by an extension of this method, co-operation and cutting down of the estimates marching hand in hand even to the vanishing-point of the estimates altogether? There is a tradition that in the palmy days of mediæval Universities, their members used to support themselves by making each other's coats and boots. The army, navy, and civil service of the future may be destined, if this bright hint of Mr. Gladstone's calumniator be properly improved, to subsist in the same manner. In the article about admitting Roman Catholics to the throne we enter upon a new field. This charge is evidently calculated for the latitude and longitude of Edinburgh, and it is quite possible that it may have been really made. But here also the meeting of hypothetical accusations of this sort displays Mr. Gladstone in a somewhat comical light. There is a story, too irreverent, unfortunately, for full quotation, which tells how an Irish electioneerer once parried a large number of accusations by replying that, at any rate, he had never committed a certain fantastic crime invented by him on the spur of the moment. The audience were expected to infer, and did infer, that his opponent was guilty of this outrage. Could not Mr. Gladstone have retaliated upon Lord Dalkeith in a similar fashion? We are afraid that he could not; for, as we have said, it has not pleased Providence to provide him, among his many and remarkable gifts, with one single grain of the commodity called humour.

The remaining charges, though less amusing at first sight, are productive of plenty of amusement when looked at a little closer, and illustrate the idiosyncrasies of their contradictor quite as well as the others. When we examine them, it appears that Mr. Gladstone's courageous denial is in some cases merely a formal and colourable exculpation; that in others it assumes as fact what is really matter of argument; and that in others, again, it is, to put the matter politely, not in accordance with history. In two cases the denial is quite true to the ear, but, as it happens, false to the sense. Mr. Gladstone is, we believe, absolutely correct in saying that he never was a faggot voter for Midlothian. But the maker of this charge—an idle piece of political recrimination enough—no doubt had in his mind the fact that something like a faggot qualification was once created, or sought to be created, for Mr. Gladstone in a Scotch constituency. In the same way it is literally false that Mr. Gladstone was in office for sixteen out of the twenty years from 1856 to 1876. As a matter of fact, Mr. Gladstone was in office during thirteen Sessions (twelve according to the most rigid computation), covering parts of fifteen different years during that time. But it is again clear that the gist of the charge is that Mr. Gladstone was in office during the greater part of the time which elapsed between the Treaty of Paris and the Herzegovinian insurrection. This is as absolutely true as the form in which it was stated is slovenly and erroneous. It may be the part of a stern logician to meet accusations in this way, but it is scarcely that of a candid moralist. In the other four heads we come upon purely argumentative matter. Mr. Gladstone denies without qualification that he sanctioned the exertions of an emissary to stimulate the war feeling in Russia. Now this matter was fully sifted in the controversy between Mr. Gladstone and Mr. Bourke a short time ago, when it was proved that, if Mr. Gladstone did not exactly sanction the exertions of an emissary to stimulate the war feeling in Russia, he did sanction the translation of a pamphlet of his into Russian by a person who was afterwards reported as publicly representing himself as Mr. Gladstone's friend, agent, or emissary; and such translation

could only have been made with the intention, as it undoubtedly had the effect, of stimulating the war feeling in Russia. Again, Mr. Gladstone denies that during his tenure of office no effort was made on behalf of the subject races of Turkey. This too is a point which has been over and over again debated, and we shall be within the truth when we say that Mr. Gladstone will find it hard to get any impartial judge to endorse his contradiction except in a purely formal sense. Much the same may be said of the article about the colonies. We need only ask what the colonies themselves thought on the subject during Mr. Gladstone's Premiership. As to announcing an intention to withdraw the country from its entangling engagements, we dare say that Mr. Gladstone never arranged those precise words in this precise order. But that they represent a legitimate inference from many of his speeches, especially those of the Midlothian campaign, is best suggested by the fact that his own supporters thought it necessary to hint gently that surely Mr. Gladstone did not mean what he is thus represented to have said. Far be it from us to question the truth and sincerity of these denials. But we think that, considering all things, they might have been a little less off-hand if they were to be made at all. That, like the others, they had better—from Mr. Gladstone's point of view and that of his party—not have been made at all, is pretty clear. They may well enough suit the purposes of Scotch electioneering, which turns much on what is called "heckling"—the proposition, that is to say, by casual persons of all sorts of insignificant questions, to which a candidate is expected to return a categorical and unhesitating answer. This extension of the catechetical method into matters political has never been very much the fashion in England; and it will, we hope, be long before it becomes fashionable. It leads, as we have seen, either to the habit of elevating the most trivial matters into a factitious importance, or else to the still worse habit of torturing truth and fact so as to give a categorical denial that will serve the purpose and be formally maintainable. If a statesman of Mr. Gladstone's rank cannot hold his own without descending to contradict vulgar rumours attacking his honesty, and without quibbling about points of infinitesimal importance with all comers, he exhibits, consciously or unconsciously, a singular weakness of attitude.

A LIBERATIONIST PANIC.

IT is commonly supposed that paroxysms of ecclesiastical fright and cries of "The Church in danger!" recur more frequently in the history of the "State Church" than in that of the "Free Churches." Yet, however it may have been in the age of Queen Anne and Dr. Sacheverell, it seems in the age of Queen Victoria and Mr. R. W. Dale that an excited condition of politico-religious apprehension is merely intermittent amongst Churchmen, but is chronic amongst Dissenters. The columns of the Dissenting newspapers for the last few weeks have exhibited the interesting spectacle of the rise and progress of a Liberationist grievance. The first note of the shriek was struck by the *Nonconformist and Independent* on January 22nd, in an article with the significant title, "The Decennial Census—Rocks Ahead." For the last two decades the Liberationist agitators have traded on the absurd and worthless statistics which were provided for them by Mr. Horace Mann in the census of 1851. English Puritanism has never been remarkable for accuracy in figures, but has always shown a preference for round numbers. The "Millenary Petition" which the Nonconformists presented to James I. bore only some seven hundred and fifty signatures instead of a thousand; but it was immediately entered in the archives of Puritan tradition, and is confidently cited by Dissenting lecturers, as the petition of the "Thousand" Ministers. No sober historical critic, Conformist or Nonconformist, has ever been able to fit a name to each of the "Two Thousand" who are supposed to have been ejected from English benefices after the Act of Uniformity, or rather between the restoration of the episcopate in 1660 and the passing of the Act in 1662. Nevertheless a modern Dissenter accepts the numerical tradition of the Two Thousand confessors quite as implicitly as any market-woman of the Rheinland accepts the numerical tradition of the Eleven Thousand virgin-companions of St. Ursula. The untrustworthy arithmetic of English Dissent reached a climax in Mr. Bright's recent speech at Union Chapel, Islington, when he rhapsodically asserted that "half the population, measured by those who attend places of worship, are Nonconformists"—by which he meant Dissenters or Separatists, which the old Nonconformists were not, having been the greatest foes to separation, as all their writings prove. No doubt Mr. Bright and his hearers heartily wish that half the population of the land were Dissenters. Whether they are or are not is very easily discoverable. If the simple, honest, straightforward question "What is your religious profession?" were put to every English head of a family by the census-takers of 1881, as the Council of the Social Science Association has innocently suggested, the statistics of English religion would be removed out of unscientific fog into scientific sunshine. Accurate and unanswerable demonstration would take the place of wild assertion and loose conjecture. Churchmen seem to have no fear of such a census; but the bare suggestion of it has filled the ranks of Dissent with panic. Detection of their bad arithmetic by a genuine census is the "rock ahead." The spark kindled by the Social Science Association has blazed up into a "burning question," and the Liberation Society, the Dissenting deputies, and all the sectarian newspapers agree in demanding that the Census of 1881 shall have no religious column, or shall be vague, useless, and misleading in the article of religion, like the Census of 1851. That Census, as every one will remember, did not include a census of religious profession, but substituted for it a census of the accidental attendance at churches and chapels on a particular Sunday. At the time of the next decennial Census, in 1861, the Dissenters raised such loud shrieks of terror and anger at the prospect of the detection of their numerical minority, that they succeeded in obtaining the rejection of a clause requiring every occupier to state the religious profession of each person in his house on the night of the Census. They wanted the State to re-establish that illusory form of taking stock of the "comparative religion" of the nation which had done them such good service during the preceding decade, and accordingly Mr. Edward Baines moved that an inquiry should be made, and returns be obtained from all places of worship, similar to those obtained in the Census of 1851.

Any one who has pondered seriously over the title of the Liberation Society cannot fail to be struck by the fact that it assumes the good of the Church of England to be the chief end of its existence. It was founded, as we all know, in order to burst the bonds of Churchmen, and to liberate them from "State patronage and control." Hence the Liberationist newspapers fall naturally into the hypocrisy of pretending to be the sincerest friends of the National Church. The *Christian World*, in an article ominously entitled "A Sectarian Census," offers the following kindly bit of counsel:—"Were Churchmen wise, they would ask for a census on the lines of 1851." It is amusing but perplexing to find that the sixpenny *Nonconformist and Independent*, which is issued from the same office as the penny *Christian World*, and which is partly made up of the same typographical materials, dissents entirely from its fellow-combatant. "The Religious Census of 1851," says the more expensive Dissenting paper, "was too damaging to the Church of England for its authorities ever willingly to consent to similar returns being obtained." If any unprejudiced observer will collect a series of the arguments which the Liberationists are now busily urging against the honest form of census proposed by the Social Science Association, and on behalf of the illusory census proposed by themselves, he will be amazed at their shifty, contradictory, and casuistical tone. Their great dread, as one of them freely confesses, is the taking of "a *plebiscite* on the subject of Disestablishment." The refusal of Liberal constituencies to have Liberationist candidates forced upon them by caucuses and "Hundreds," of which local Dissenting ministers invariably form a component part; the regular diminution of Dissenting congregations by the ravages of Ritualism on one side and of Plymouth Brethren and the more "dissident" sects on the other, are possibly opening their eyes to the fact that they have been living in a fool's paradise for the last twenty years. They have been congratulating themselves and heaping together political capital throughout this period on the credit of the "religious accommodation" which they have provided, the chapels which they have built, the sheds which they have hired, the theatres which they have opened for Sunday performances, the "sittings" which they have added. The official statistics of Wesleyan Methodism, to say nothing of less popular sects, have proved year by year during the same period that the increase of sittings and the decrease of sitters may be correlative ecclesiastical phenomena. A Dissenting minister writing to the *Nonconformist* and *Independent* trusts that "an effort will be made to carry a clause providing for accurate returns being obtained of the number of places of worship and of sittings provided by each religious denomination"; and he adds that "it would be well to give publicity to the fact, which is already demonstrated by the returns in the Diocesan Calendars, that the Church of England does not provide accommodation for more than a fourth part of the population." These shifty, worthless, and indirect tricks of sectarian arithmetic are to be urged upon the State in order that the State may save the sects from revealing the comparative numerical feebleness of their adherents. The Dissenting leading articles upon the Census make fun of an immense number of Englishmen whom they please to label "nominal adherents of the Church." But, unless every sitter upon a new Wesleyan, Independent, or Baptist "sitting" may be asked the direct question, "What is your religious profession?" how can the statistician be certain whether the sitter is or is "not a *bonâ fide* member of the Church" of Methodism, Independency, or Anabaptism? The sitter may have taken the sitting because he admires the preacher, or because the chapel is near his house. Other reasons may have guided his choice. Some time ago we were informed by an official of an Independent congregation that a friend came into his town with the intention of setting up a baker's shop; but before deciding where he would take a "sitting," he put the leading question, "Can you tell me, as a friend, at which chapel there are fewest bakers?" If the Liberationist has a right to insist that the State shall weed the National Church of all Churchmen who are "nominal adherents," of all who are not "*bonâ fide* members," the statistician has a similar right to demand that each sect shall only be allowed to claim as its own those who are "*bonâ fide* members," and are not merely "nominal adherents." The latter phrase, as used by Liberationist agitators, is an intolerable insult to hundreds of cultivated Englishmen, and to tens of thousands of the English poor. Clergymen and Dissenters alike need to be reminded that a man may be a very zealous

Churchman without being a regular church-goer? The Church of England never had two more devoted adherents than Coleridge and Wordsworth. Their influence is felt at this hour in the direction taken by the two most influential forces of her contemporary life—the High Church movement, and the Broad Church movement; the foremost men of these two schools were in great measure the spiritual children of one or of the other, or of both. Yet Wordsworth and Coleridge were not assiduous church-goers. It must be remembered that church-going is not a part of the religion of a Churchman in the same degree in which the "meeting" is a part of the religion of a Dissenter. It would be easy to produce a very long catalogue of enthusiastic Churchmen, from the days of the canonized hermits to our own generation, who did not or who do not comply with that dogmatic test of "*bond fide* membership" which the Liberation Society, the Dissenting deputies, and the sectarian newspapers have defined as the only true test, and which they want the State to establish by law in its Census of 1881. The professed foes of Establishment and of State interference in religion coolly demand that Mr. Sclater-Booth's Census Bill shall be made into a new "Test Act," which is to be turned against Conformists instead of Nonconformists.

We have already observed that there is something shifty, casuistical, and self-contradictory in the Liberationist scheme of counting seats instead of counting souls, and in the pleas which the agitators offer for their misleading alternative. This plan is to be forced by the State upon Churchmen in order to compel them to submit to some "*bond fide* test" of their religious opinions; but Dissenters, on the contrary, are to be freed by the State from any compliance with the more direct and common-sense plan desired by every serious statistician, and used in every other civilized nation in Europe, "because," as Mr. Henry Richard said to the Dissenting deputies, "we deny the right of the State to make this compulsory inquisition under penalties of law into the religious opinions of the people." Their religious opinions are not the object of the inquiry, but their denominational membership. Mr. Richard thought he had made a splendid point, and he was rewarded by the "laughter" of his audience, when he demanded, "Who is, for instance, to say the religious opinion of a baby?" The most scrupulous of householders can scarcely refuse to say whether the baby is to be entered as a member of the family of Smith, or of Jones, or of Montmorency. Mr. Richard speaks exactly as if it were still a political offence to be and to declare oneself a Roman Catholic or a Quaker. It is surprising to us that he and his fellow-agitators against an equitable common-sense Census show no sorrow at the declension of that spirit of "testimony" which was the glory of former generations of Puritans, Quakers, and Methodists. Concealment of their religious profession, which the degenerate sons affect to regard as a supreme obligation of the conscience, would have been regarded by their ancestors as the deepest crime against conscience. The *Freeman*, a weekly organ of the Baptists, goes further than Mr. Richard, and manages to discover a similarity between the English House of Commons and King Nebuchadnezzar. "Let our friends of the Establishment," it exclaims, "enrol amongst their number all the infamous and impious who have not the courage to avow their scepticism; that is their business." And after handing over, with genuine Pharisaism, "all the publicans and sinners" to the Church, it goes on to assert that the Baptists "object to the Inquisition; it is no secret that many excellent Christian men are prepared at any cost to follow the grand old Nonconformists of Babylon and dare the results, simply writing 'O Nebuchadnezzar, we are not careful to answer thee in this matter.'" The choice of a precedent does not say much for Baptist study of the Old Testament. Nebuchadnezzar had commanded "an inquiry to be made into the religious profession of every inhabitant"—we use the words of the Dissenting deputies. The three Conformists to the National Church of Israel, instead of refusing to state "their religious profession," like the English "Nonconformists," made the boldest and most open statement of it. If the *Freeman* had quoted the seventeenth and eighteenth verses, it would have perceived the absurdity of its perverted application of the sixteenth verse. The Church and the sects do not and cannot agree as to the human elements which go to make "a Church." The former, quite independently of the accident of its establishment or disestablishment, is built upon foundation as wide as humanity and nationality, and offers baptism, the instrument of its membership, to "all nations" and to "every creature." A sect, on the contrary, is built upon the narrower foundation of election, or of conscious conversion, or of agreement in a set of religious opinions. The Brownists and Anabaptists of Elizabeth's day gloried in being the members of little flock." They declared the parochial congregations of the Church of England to be no churches, but anti-Christian assemblies, because they were too wide and generous, and comprehended the "mixed multitude." In the same spirit of excommunicating narrowness, the modern Liberationist interferes with the freedom of religious confession. He says, "I have decided, and I want the State to decide, that church-going, chapel-going, sitting or pew-hiring, are the only permissible proofs of adherence to a Church. Unless the census-taker finds you at church, I shall not allow you to call yourself a Churchman."

GOODRICH CASTLE.

"LORD TALBOT of Goodrig and Urchenfield" is one of the titles of "our English Achilles" in the swelling proclamation of that hero's honours in the first part of *Henry VI*. The traveller to Goodrich Castle, between Ross and Monmouth, will owe neither to the annotators of Shakspeare nor to Murray's *Handbook to Herefordshire* his information that this baronial fortress stands within the remarkable territory of Archenfield, or that it was the feudal home of the renowned antagonist of Jeanne d'Arc. Sir John Talbot's presence, indeed, was more powerfully felt on the banks of the Loire than on the heights of the Wye, but his war-beaten face was feared even in the latter province. We may first touch upon the character of his border feudality, which before his time held some singular political privileges. Urchenfield, or, as it is named in Domesday, Archenfield, or, as it was called under the Welsh princes, Ergyng, comprehended the portion of Herefordshire south-west of the Wye; Moccas being the most northerly parish, and the ancient confines of the province being the same as those of the present Deanery of Irchinfield, which includes thirty-eight churches. In the reign of Edward the Confessor the borderland of Ergyng was inhabited by a mixed population of Welsh and Saxons, having laws and customs of their own. The King had there ninety-six freemen with their villeins, who paid tribute to the crown in honey. In keeping with the custom of more purely Saxon states human life was valued in pieces of silver, a King's man being worth twice as much as a thane's man. If a Welshman killed a Welshman the parents of the slain man plundered the slayer and his relations, and set fire to their houses and harried them until the burial of the corpse on the following day at noon, the King receiving a third part of the prey and the parents of the victim keeping the remainder. To "post like the commandment of a king," Ulysses's instance of peremptory despatch, would not in this liberty have applied, for here the King's writ did not run. Screened by forests, defended by rocks, and moated by the river, the region was a natural stronghold of freedom and independence. The prerogatives of the people were therefore thought worthy of careful statement in Domesday in order to their conservation; for the men of Archenfield were, moreover, a warlike body which the Conqueror thought it wiser to conciliate than to offend, and to rouse for rather than against him. Their claim to lead the royal army in marching towards the enemy, and to form the rereward on return from an expedition, was allowed, together with other observances that marked them a peculiar people. It is stated that King Edward the Confessor had here three churches, whose priests, besides offering masses for him every week, performed his embassies to the Welsh chieftains; for the ministers of religion were reverenced, says Higden (*X. Script.*, 188) like angels, no ambassadors being so willingly obeyed. The churches referred to are Hentlend, Whitchurch, and Ballingham, which are still comprised in the Irchinfield deanery. Eighty years before St. Augustine lifted up the cross at Canterbury Dubritius had Christianized the Welsh borderland; and to that saint each of the churches named is dedicated, they having been, until the year 1133, included in the see of Llandaff, of which he was bishop. The prescriptive relief from ordinary tallage was enjoyed in the province until 8 Edward III., when, notwithstanding the petition of the inhabitants for continued exemption, and their citation of Domesday in proof of their historical freedom from tribute, except to proceed in the Royal army when commanded, they were taxed with the rest of the county of Hereford (Rot. Parl. II. 82).

It is fortunate for the modern eye that in old days the point of landscape best suited for a defensive work generally commanded the choicest scenery, a remark to which the situation of Goodrich Castle is no exception. Natural perfection of landscape, said a critic of the last century, is not often realized. Nature, says William Gilpin, lays out her plans on a magnificent scale, but shows little taste in the distribution of her opulent materials. Her barbaric riches require artistic skill to arrange so that "lines of confusion and stones of emptiness" may be brought into harmony and fulness of meaning. But "the landscape at Goodrich," remarks our fastidious critic, "is correctly picturesque," a judgment in which most spectators of the scenery will agree. The winding river, bordered on one side by verdant acclivities, and on the other by stately cliffs that are broken and splintered into a thousand wild and grotesque forms and draperied with creeping shrubs, flowers, and foliage of all colours, might have inspired Milton when he described the outskirts of Eden. At least it may help us to realize his picture, particularly when the level rays of a glittering sunset strike across the natural turrets and battlements in the distance, and the "rocky pillars" on the frontier of the vista.

Goodrich Castle is not mentioned in Domesday, nor is there any account of its erection. Godric Mappeson, whose name explains that of Goodrich, is said in the Survey to hold pastures and a fishery in Archenfield, for which he returned eighteen sextaros of honey; a kind of tribute which shows that an *apium custos*, or keeper of bees, was among the twenty-nine serfs who cultivated his estate. Herefordshire and Gloucestershire in the eleventh century were lands flowing with milk and honey, or at least with honey, bees, if we may judge from the evidence of Domesday, being almost as abundant as flowers. In the preparation of mead and of confections for sacred and secular feasts, honey was an important article of commerce, and nearly every

copse, grove, and monastic garden in certain provinces fostered its swarms of bees. The rectangular keep, which is the most perfect portion of the ruin, is one of the border "castles and pyles" which William II. empowered the Lords Marchers to erect against the predatory incursions of the Welsh. The Red King had thrice invaded Wales in person, the last time in 1089, when he threatened to exterminate every man in that turbulent country. He was roused to this furious spirit of vengeance by the Welshmen having, in spite of the Royalists of Archenfield, seized the opportunity of his absence in Normandy to lay waste the bordering counties with unsparing slaughter of their inhabitants. William's sanguinary intention was defeated by the protection afforded to the enemy in the impenetrable recesses of their mountains and forests. Being baffled in a summary conquest of the country, Rufus deputed the work of subjection to his chief barons, of whom it might be said, as of the servants of Alexander in the Maccabees, "they all put crowns upon themselves"; and their claims to petty sovereignty lasted to the time of Sir John Talbot, who exercised his power with traditional severity, though not with "snaffle, spur, and spear," as did his forerunners. One of these chieftains was Hugh de Lacy, whose feudal sway in Herefordshire extended over sixty-five lordships which had been confiscated from Roger his brother, on account of the latter having conspired against the king in favour of Robert Curthose. The head of Hugh's barony was Ewias, where he founded Llantony Abbey; and included in his demesne was a great part of Wormlow, within which hundred lies Goodrich Castle, a fortress that in its Norman portion agrees with De Lacy's period and is probably of his foundation.

Hugh de Lacy died in 1131 without lineal offspring, his estates being consequently inherited by Gilbert, his sister's son, but Goodrich seems to have been withheld by the king. The first time we positively hear of the castle is in 1165, when it was granted to the powerful William Marshall, Protector of the kingdom during the minority of Henry III., who paid two knight's fees (about 30s.) annually for the possession. Marshall presents a more favourable figure in Shakspeare's *King John*, where he passionately reprobates the murder of Prince Arthur, than in Matthew Paris's *Chronicle*, where we are given to believe that in commanding a military expedition against the Irish he used such severities of sword and fire as to render the provinces of that people another Golgotha. Above all, he wrested by violence two fair manors from a bishop, who in resentment pronounced against him sentence of excommunication, and moreover prophesied that his sons should be deprived of the blessing of increase. It fell out, accordingly, that they had no sons to meet the enemy at the gate; the male line of the Marshalls failing with Anselm, the last surviving son of the Protector, who died at Chepstow Castle in 1245, twelve days after the death of his brother Walter at Goodrich Castle, where, some years ago, his seal was found among the ruins. The two massive drum towers which give such picturesque grandeur to the remains were built either by William de Valence, to whom the castle was granted after the Marshalls, or by Aymer his son. William obtained the hand of Joanna de Monchensy, niece of Anselm Marshall, together with the earldom of Pembroke. His warfaring experience had been as various as the Knight's of the *Canterbury Tales*. He had reddened his sword against the Saracens, and afterwards against the Welsh. When the barons took up arms against the foreigners and Valence he was obliged to fly from the kingdom. On his return he, at the siege of Northampton, put the baronial forces to rout; but again losing all at the battle of Lewes, he was forced to escape to France, till the battle of Evesham gained him back his estates. In 1296 he was slain at Bayonne. His body being brought to England, Aymer built over his remains the rich tomb of French design with its Limoge enamels in Westminster Abbey, where a still more splendid resting-place, on the north side of the sacrarium, was secured for himself. Joanna his widow continued to reside at Goodrich Castle, and there received, in 1297, Joanna daughter of Edward I., and her son Gilbert, with a large retinue. This Joanna came to the Countess for advice, being in a great strait, in consequence of having married, unknown to her father, the obscure Ralph de Monthermer, who was her second husband. Mrs. Green, who in her *Lives of the Princesses* (vol. ii. p. 345) tells the whole story, suggests that the greeting of the friends would not have been so cordial had the Princess foreseen that Isabella, the daughter of the Countess of Pembroke, who was then at the castle, would by and by be the second wife of her own loved Monthermer. The household roll of the castle at this period shows, among many curious entries, the lavish hospitality of the Christmas cheer—25th Edward I.—when as many as thirty-three oxen were sacrificed to the appetites of the numerous guests. The Scandinavian custom of having abundant swine's flesh, with the typical boar's head, was then not forsaken in England; and so we find that eighty pigs shared the fate of the oxen, wine in proportionate quantity being supplied from the great mart of Bristol.

Aymer de Valence, son of the Countess Dowager, who died in 1307, inherited the title and estates. He was a tall pale man, nicknamed by Gaveston "Joseph the Jew." As he was the destroyer of Nigel Bruce, of Piers Gaveston, and of the popular Thomas of Lancaster, the less regret was felt that he himself died not the common death of men. The last of his three wives, Mary, daughter of Guy de Chatillon, was maid, wife, and widow in one and the same day:—

> Sad Chatillon on her bridal morn,
> Who wept her bleeding love.

For on the day of her wedding her lord was killed at a tournament held to celebrate the occasion (23 June, 1324). Thereupon she founded Pembroke Hall (now College) at Cambridge. As he left no offspring his estates devolved to Isabel and Joan, his two sisters' daughters. Joan married John Comyn, who was stabbed to death by Robert Bruce for refusing to support his claim to the Scottish crown. Elizabeth Comyn, one of their three children, became the wife of Richard Talbot, by which union Goodrich Castle came to the great Shrewsbury family. This lady was violently seized at her house at Kennington by the rapacious De Spencers, concerning whom there was a Welsh proverb that when anything was missing whether an ox, or an ass, or a fine woman, it was "gone to Caerphilly," their great stronghold. Lady Talbot was kept in durance for more than a year, until, compelled by threats, she consigned Goodrich and the manor of Painswick into their hands, the younger of these favourites of the king appropriating the present castle. Goodrich became the principal seat of the Talbots, and by license from Edward III. Richard, the first of the family who held the estate, constructed at the basement of the keep a prison for offenders. It was a strong apartment, fifteen feet square, with an inner cell, which had a small orifice for the admission of air; but the outer cell, which was entered by a low-pointed arch still to be seen, had no provision for air or light. Lord Richard served Edward III. in his wars, being allowed seven knights and one hundred men as his retinue. He died 1356. Flanesford Priory, below the castle, was of his foundation, and there are extensive remains of it now used for farm offices.

The castle derives its chief interest from having been the home of the renowned Sir John Talbot, the sixth baron, who has been more celebrated by the poet than by the historian, for, singular to say, though one of the greatest soldiers of English history, there is no biography of him, except in the merest sketch, in his native language. But Shakspeare and Schiller, to say nothing of Voltaire and Southey, have well celebrated his heroic deeds, though a peasant maid was his chief antagonist. He was born in 1384, being the second son of Richard (II.) Talbot, from whom he inherited the castle in 1421. A room, or the site of one, in the keep is pointed out as his favourite apartment. His departure in 1427 for the second time to the French wars was perhaps as little regretted by his neighbours about Monmouth as his presence was welcomed by the enemy at Orleans, for he seems to have been hardly less a scourge at home than abroad. In 1423 a petition was preferred against him by the male inhabitants of the Hundred of Wormlow, complaining of "many and various extortions, oppressions, murders, homicides, forcible and violent ejections from their lands and houses" endured by them, and their wives and children, together with the wrong imprisonment of some in strong dungeons until ransom for their liberty could be found; all which iniquities were committed by Sir John Talbot and his brother, jointly with fifty gentlemen of his retinue; and the petitioners dolorously prayed the Commons for a Government inquiry to restrain these malpractices (*Rot. Parl.* vol. ii.) For twenty-four years he was the dread and dismay of France, and victorious in no less than forty battles and skirmishes; his campaign against the mysterious Maid of Orleans being, of course, the most romantic episode of his warlike career. "His nobleness," says an old writer, "bred such terror in the hearts of the French, that ofttimes great armies were defeated and put to flight at the only hearing of his name, insomuch that the French women, to affray their children, would tell them that 'The Talbot cometh.'" His good fortune failed him at the battle of Patay, in 1429, when he was overmatched by Jeanne d'Arc, and taken prisoner, with Lord Scales and others. For three and a half years he was in captivity, the good citizens of England taxing themselves the while for his ransom. Though the conspicuous virtue of Talbot was the Achillean one of valour, which, like charity, covers a multitude of sins, we do injustice to his devotional character if we accept Schiller's dramatic presentment of his taking leave of the world. When wounded to death at the battle of Chatillon we find him, in his Germanized form, breathing a pessimist's scorn on the whole system of things, with as firm a conviction as the Schopenhauer of a later day that whatever is is wrong, and with as seeming a disbelief of an explanatory hereafter. Shakspeare gives a truer and more touching picture grounded upon the old chronicler Hall's account of the parting scene between the dying knight and his son, Lord Lisle, who perished by his side, and "soul with soul" fled with him "from France to Heaven." Had he been a canonized saint his relics could not have been more marvellously recovered. Like "the brand Excalibur," his sword was flung into deep water; at least it was found in the river Dordogne. It bore the inscription, "Sum Talboti MIIIICXLIII. Pro vincere inimicos meos." A sword with bad Latin upon it, but good steel within it, says Fuller. Whether this weapon yet exists we know not, but at least as interesting a relic is his Prayer-Book, which, after remaining in obscurity for four centuries, was sold by a peasant to a Breton collector, from whom it passed to the Didot Library. On the dispersion of that collection it was secured by Mr. Quaritch, who lately offered it in one of his remarkable catalogues for 1,000*l*. The precious MS. was a gift from the Duke of Bedford to Sir John Talbot on the occasion of Sir John's marriage with the sister of the Earl of Warwick, c. 1424. The devotional verses believed to have been inscribed by Talbot himself in the volume, and liberally quoted in the catalogue, are worthy for their poetic vigour and touching sincerity to be included in a chronological selection of sacred pieces. But the most striking discovery of all was that of Talbot's body, within the last few years, at Whitchurch, Salop. There had been much uncertainty as to the place of his final

B

sepulture, though there was little doubt of his having been first interred at Rouen. By the instruction of his will, dated Portsmouth, 1 Sept. 1452, not long ago examined by Mr. Stephen Tucker, Rouge Croix, he was to be buried in the chancel of Blakemere church—an injunction said to have been over-ruled by a promise made to his bodyguard of Whitchurch men, who saved his life at Patay, that he would be laid among them at their English home. The question was decided in 1874 on the removal of his effigy to effect some repairs of the monument at Whitchurch. His bones were found, and through the fissure in his skull made by the fatal axe-blow a mouse had entered, and in the "very dome of thought and palace of the soul" made a nest for her young—a singular burlesque on the once mighty Talbot.

Goodrich Castle remained in possession of the Shrewsbury family until 1616, Lord Gilbert, with Mary his wife, being the last of the Talbots who was resident there. He died May 8, 1616, leaving Elizabeth, his daughter and heiress, who was married to Henry Grey, Earl of Kent, in whose family it continued till the death of the last Henry, Duke of Kent, in 1740. It was then sold to Admiral Griffin of Hadnock, Mrs. Marriot, his granddaughter, being now or lately the owner of the ruin.

Standing on an elevated promontory, the castle from the river is on its south side nearly hidden by foliage; but, as approached from the north by fields, the bold masses come into full relief. The general outline is a parallelogram, with a broad round tower at each angle; the extreme length being 176 feet, breadth 152 feet, and the average thickness of the walls 7 feet. The grey Norman keep is built of stone from Dean Forest; but the flanking Edwardian towers, and the rest of the structure, are made of sandstone excavated on the spot, and are as red as Murray's Handbook. The entrance to the Castle, which is near the east angle, is itself a fortress of almost impregnable strength. A dark vaulted avenue, 50 feet in length, it was first defended by a drawbridge over the castle moat, which was formed by the quarry from which the building stones were dug. About 11 feet within was a massive gate, over which were machicolations for pouring boiling water or molten lead on the heads of assailants. Beyond this gate were two portcullises and another strong gate. The fine banqueting hall, the Early English chapel, and many other apartments, together with the watch tower, the galleries, the concealed passages within the walls, and the cunningly-placed loopholes, are a rich study for the curious in castle architecture.

Notwithstanding the immense strength of the fortress, it is not known that its capacity for resistance was tested before the Great Rebellion. At that epoch it was first occupied by the Parliament; but in 1646 it was garrisoned for the King by Sir Richard Lingen, and reduced by Colonel Birch, whose Diary, published by the Camden Society, gives an account of his operations. The enemy was eighteen weeks before the Castle, losing twenty-four men before the capitulation. The energy of the final assault is shown by the rent and ruined walls, whose "old baroness" has been rendered by time as picturesque as the scenery. We are sorry that Wordsworth has not left in a sonnet the impression of his visit to Goodrich; but we may recollect that his poem "We are Seven" was suggested (June 1798) by meeting among the ruins the child-heroine of the piece.

CABS AT ELECTIONS.

THE heart of the conscientious cab-proprietor, as well as of the conscientious election agent, will be gladdened by a Bill which the Attorney-General brought in on Tuesday last. As everybody knows, one of the most obvious outward and visible signs of an election is the cab provided for the occasion with staring posters, driven by a charioteer who is not always in a state satisfactory to Dr. Richardson, and containing independent electors whose external appearance is not that of "carriage company." Everybody ought also to know (though it is possible that everybody does not) that the existence of these cabs, or at least their use, is a more or less direct breach of the law. By various acts dating as far back as 1854 it was made illegal to pay any sum for the conveyance of voters to the poll. The Attorney-General now proposes to do away with this prohibition, and from the general tenor of the remarks made on his proposal, it seemed probable that it would not meet with any serious opposition, though not a few notices of amendments have been given since. The privileges now enjoyed by the so-called agricultural boroughs, Cricklade, Shoreham, East Retford, and a few others, would thus be extended to the whole kingdom; and the voter would be able to enjoy his drive without the feeling, which no doubt is deeply painful to him at present, that he is helping to commit a breach of the law. To the candidates it will probably not make much difference. As it is, every available cab and omnibus, almost every available vehicle of any kind, is engaged on one side or another at elections in every borough, large or small; and therefore the question of increasing or diminishing election expenses will hardly be considered.

It has been noted of old that elections give peculiar scope to the natural desire of law-abiding Britons to break the law in small points. There is not much temptation nowadays to candidates to indulge in the cynical diversions which Mr. Sarcastic permitted himself in the case of the borough of One Vote. The ingenuity of agents is sadly circumscribed by the Ballot, by the abolition of the hustings, and by the impossibility (not to mention the uselessness) of bribery and treating on a great scale. In the employment of messengers, paid canvassers, and miscellaneous hangers-on of all sorts, openings still exist in a small way for improving the chances of the party. But the conveyances are by far the most important item. In the first place, though their employment is clearly illegal, there is, as the Attorney-General pointed out, no definite penalty for it. Often, too, the danger, slight as it is, is evaded by one of the old tricks dear to the political mind. The cabs are paid for, not by the candidate or his declared agent, but by a confiding friend, who is not reimbursed till a sufficient period has passed to enable unpleasant inquiries to be defied. In procuring the coveted vehicles, too, there is endless opportunity for jockeying. At the last Liverpool election, for instance, one party was said to have secured all the cabs in the town, so that ferry-boats and trains full of vehicles had to be imported at the last moment from Birkenhead and Manchester. The recent announcement of the dissolution is reported to have occasioned a similar stroke of policy in many other boroughs. On the day of the election itself, and even for some time before it, the cab, as we have said, is a highly important feature of the contest. That the cab power engaged bears any reasonable proportion to the work which ostensibly has to be done cannot, indeed, be said. Even in the largest boroughs polling stations are tolerably numerous, and considering the number of hours during which the poll is open, it may be estimated that about one-twentieth of the vehicles actually engaged would usually suffice to take all the voters to the poll, supposing every one of them to be lame and unable to walk. The election cab, however, is contrived to pay, not a double, but a tenfold or twentyfold, debt. In the first place, it serves as an effective movable machine for the display of the party colours and of the brief and exciting appeals which electioneering ingenuity concocts. "Robinson and Retrenchment" may appear on its back. "Vote Early for Robinson" may decorate the doors, and a few banners and streamers with similar devices blossom on the roof and the box. Off duty—and it must be confessed they are very often off duty—the cabs cluster round the public-houses, and form agreeable masses of colour, while their drivers and passengers discuss the state of the poll over beer which is, let it be hoped, not gratuitous. Occasionally a voter, usually in solemn solitude, with his legs on the front seat and a pipe in his mouth, is actually conveyed to the poll. More frequently parties of voters, or possibly non-voters, take healthful and refreshing pleasure drives about the borough, and genially pay their fare by cheering for the generous hirer, sometimes also for his opponent. To be conveyed to the poll in the cab of the man you are not going to vote for is held to be a piece of exquisite wit by a certain class of electors. Besides all this, the vague desire to "rally round" their man, which Dickens ridiculed in one of his happiest hits, always besets large numbers of persons at elections. Messrs. Buffer and Boots were far from being singular in the notion that to take a cab and gallop somewhere is a political demonstration of great and helpful significance. Nor is it to be forgotten, lastly, that the engagement of a considerable number of cabs or other vehicles, especially if they are of local origin, indirectly secures a considerable amount of support. The cab-owners certainly, the cab-drivers not improbably, are voters, and the hangers-on of one kind and another add to the number of persons who are under obligations to the candidate. It would be unfair, perhaps, to agents, and it would certainly be unfair to candidates, to say that the augmentation of this number is the chief object to which outlay is directed. But it would, on the other hand, be ridiculous to affect to believe that it is not an object at all. Direct bribery has become impossible in its old form, and as yet no organization of cliques and wire-pullers seems to have been generally set on foot to make it possible in a new form. But indirect bribery in the form of lucrative employment is still possible enough, and has the advantage of looking much more respectable. In old days there was not much bashfulness about the reception of half a ten-pound note before, and the other half after, the voter had recorded his vote for the generous donor. But even the people who did hesitate about this transaction are not likely to see much harm in a contract for cab-letting at a little more than market-price, or an engagement at handsome wages in some possibly useful, and certainly harmless, capacity.

Some persons of rigid virtue in the House of Commons appear to have thought that it might be better to strengthen the present prohibition than to repeal it. In the abstract they are probably right. But if a law is universally broken without much chance or possibility of punishment, and without any very obviously bad consequences, repeal is the most practical, if not the most dignified, course. There is just sufficient, though only just sufficient, reason for the use of parti-coloured vehicles to justify it formally. It is possible that to some of the poorer voters the time occupied in walking to the poll and back may be of importance. If the cabs were absolutely cut off, a multiplication of polling-places would be called for, and this in its turn would give colour to a multiplication of paid agents of different kinds to look after the candidates' interest at each polling-place. The possibility of corrupt or semi-corrupt practices would thus only change its form, and not disappear. It is noticeable that the Attorney-General proposes to legalise the conveyance of voters, not merely by cab or omnibus, but by railway. The issue of railway passes to out-voters in counties has been common, and there is no doubt that it has added very largely to the great expense of such elections. Such conveyance stands on rather a

different footing from the cab-hiring which we have been considering, and if it were extended to boroughs, it might lead to a considerable increase of expense in this case also. It must, however, be admitted that it is difficult to attach any corrupt character to such a proceeding, while the hire of exclusive conveyances certainly lends itself in a certain degree to corrupt practices. Still the argument that it is well to accept facts and to legalize custom has some weight. From another point of view the election cab, though surely an absolutely beautiful object, is one of the last remaining ornaments of the terribly unpicturesque election of the present day. From the nomination, huddled over in a few minutes, to the shabby polling-booths where the elector hides himself as if he were going to do something disgraceful, all is painfully devoid of movement and colour. The election cab contributes both, sometimes a great deal of both. We should be glad to think that its elevation into the status of a legal vehicle would be followed by an improvement in the style of its decoration. The age is one of some little pretension in this respect, and though we have no Herr Makart, like the Viennese, to arrange our "triumphs," we are not destitute of ingenious artists. Now that valentines have been made not wholly hideous, attention might be turned to election posters. The ordinary Clarence cab is not a promising subject to work on, it must be confessed, but it is all the more tempting to ambitious reformers. The enterprising publishers who devote themselves to Christmas cards might perhaps find a profitable occupation in this new direction.

THE BUYING-OUT OF THE WATER COMPANIES.

THERE can be little doubt that the Dissolution has killed Mr. Cross's Water Bill. His own answer to Sir C. Dilke on Monday evening seems to imply as much. And indeed it is obviously unlikely that, in the face of the universal disapproval which the measure has called forth, it will be brought forward again in its present shape, whatever may be the result of the elections. But a definite scheme for buying out the Water Companies having been laid before the House of Commons by a responsible Minister of the Crown, the question can hardly be allowed to drop altogether. If the present Government remains in power, it is in some sort bound by its agreement with the Companies, and probably may think it incumbent on it either to induce them to modify their terms, or else to take a vote of Parliament on the subject. If, on the other hand, the Liberals get a majority, they may be expected to bring forward a plan of their own, were it only to prove to the country how much better than their opponents they take care of the public interests. It is desirable, then, even now to discuss Mr. Cross's Bill, to point out where it goes wrong, and endeavour to find the true principles on which any future measure should be founded.

The first point to be borne in mind is that the buying out of the Water Companies has become necessary because they have failed to do their duty. They do not give a sufficient supply, and the water which they do give is not pure. They have therefore no claim to more than just and equitable treatment. Now the law does not confer upon them a monopoly of the water-supply of London, and it does not permit them to increase their profits indefinitely. The majority of them are limited to dividends of ten per cent. When, therefore, Mr. Cross proclaimed that he would be no party to a compulsory purchase, he placed himself at a hopeless disadvantage as a negotiator. His error was of precisely the same kind as that of a diplomatist who should announce to a foreign Court whose aggressions he wished to restrain that, whatever might happen, his Government would not fight. It was not at all necessary for Mr. Cross either to propose compulsory purchase or to threaten the Companies with the proposal. All the world knows that Parliament has the power to buy out whom it pleases and to create as much competition as it will. All that Mr. Cross need have done was to inquire of the Companies their terms, reserving to himself the right to improve the water supply of London in some other way, if a reasonable bargain could not be struck. This would not necessarily have implied a threat of compulsory purchase; it might have only meant that the Government would try whether it could not force the Companies to give pure water and constant service—in short, adopt towards them the policy pursued towards the Gas Companies. Another error into which Mr. Cross fell was, we think, the proposal to create a Water Trust. We have already too many local authorities in London. In every parish, or union of parishes, we have a Vestry, or a Board of Works, and a Board of Guardians; above these we have the Metropolitan Board of Works and the Corporation, the Metropolitan Asylums Board, and the School Board, and Mr. Cross would add a Water Trust. It is the mistake committed in the United States, where there are so many Legislatures that all of them are more or less inefficient, corrupt, and ignorant. The true course is, where it is practicable, to amalgamate, rather than to multiply. We have in London trained, practised, skilful administrators in an abundance such as no other city in the world can equal, and yet our local boards are composed of nobodies. We have never advocated the dangerous project of a colossal London municipality, but there is no reason for going to the opposite extreme and needlessly multiplying separate local j[illegible]

But it may be more to the purpose to show the badness of the bargain made for us by the Home Secretary. Mr. Cross undertook to secure to the shareholders the full amount of their present income, and in addition to pay such a sum as would represent their expectation of increased income in the future. But it is to be borne in mind, in the first place, that the Companies are by no means sure of continuing to earn their present income without further outlay of capital. The Bill was introduced because the agitation for purer water and a better service had become so strong as to compel the attention of the Government. But if the Companies were obliged to supply pure water and to give a constant service, what chance would there be of their continuing to earn the present percentage of profits? The very starting-point of the negotiations is thus questionable. And as for the purchase of the unearned increment, while in principle it is undoubtedly fair, in detail it compels the water consumers to pay now, and too heavily, for a benefit in a perhaps distant future. We have shown that the income of the Companies must probably fluctuate, and that its increase may be considerably postponed, yet Mr. Cross's Bill would have assured to them its present full amount, and the full amount of the expected increase according to the Companies' own calculations; and it would have guaranteed both these by mortgaging the water rates in the first place, and, in addition to them, the general rates of the metropolis. The extreme possible value, present and future, of the Companies' property having thus been paid for, what would the inhabitants of the metropolis acquire? Not a complete water service, not even the machinery for supplying such service, but simply the right to reject the foul water of the Thames and the inadequate filtering beds, to condemn the inefficient machinery and worn-out pipes, and to provide for themselves a proper supply. In other words, when the Companies were bought out, many millions would still have to be spent in bringing to London wholesome water in the requisite abundance. That, of course, is no reason why the shareholders in the Water Companies should be made to take less for their property than it is worth. As Parliament has encouraged them to invest their money in undertakings which perform a public service, however inadequately, there is no question that they should be fully compensated when their property is taken over. But it is a reason for vigilant care that no more than fair compensation should be paid. A few figures will show that more than fair compensation was proposed to be given by the Bill.

In round numbers, the capital of the eight Companies may be set down at nine millions, though, in fact, it is a little less. And at the end of last August—that is, shortly after Mr. Cross's promise in the House of Commons that he would introduce a Bill for buying them out—the market value of that capital, taking the Stock Exchange quotations of the shares then sold as the basis of the calculation, was a little over 16¾ millions. This latter sum, then, represents the value of the Companies' properties in the opinion of men of business. And of course it includes the prospective as well as the present value. But as the number of sales at the current prices was small, it must be added that, in the opinion of the shareholders themselves, the properties were worth more. Let us, then, take another estimate. According to the first schedule of the Bill, which gives the amounts to be paid to each of the eight Companies, the present aggregate income of the eight is 773,454*l.* Now at twenty years' purchase the price of this income would be 15½ millions. We should have thought that twenty years' purchase would be ample for water-works. But we have already seen that at the end of August last the shares were worth 1¼ million more at the quotations then current. It is, however, to be borne in mind that at that time Mr. Cross's promise had already been given, and that consequently the shareholders were reckoning upon obtaining something like a fancy price from the Government. But, not to push the argument too far, let us take, what everyone will admit to be a sufficiently high valuation, twenty-five years' purchase, and the price will still be under 19½ millions. Even at thirty years' purchase, it would not quite reach 23¼ millions. And, be it remembered, in all these computations we are assuming that the present income is maintained without the outlay of additional capital, which, as we have already shown, is an untenable assumption. Now let us see what the price offered by the Bill actually is. It is 22,098,700*l.* paid down, and during the next twelve years 9,300,000*l.* additional, both of these amounts in the form of stock bearing 3½ per cent. interest, and guaranteed, as we have already said, by a mortgage on the water-rates and on the general rates of the metropolis. The total purchase-money is thus 31,398,700*l.* Judging by the stock of the Metropolitan Board of Works, it may be taken for certain that the proposed 3½ per cents would sell at par or above it. The present value, therefore, of the Deferred Stock—that is, the 9,300,000*l.*—would be over 7¾ millions. Consequently the present value of the purchase-money would be about 30 millions. Thus the price offered by Mr. Cross to the Water Companies is about 80 per cent. higher than the value at the Stock Exchange prices nearly a fortnight after he gave his promise to buy; it is nearly double the value at twenty years' purchase; it is more than 50 per cent. higher than the value at twenty-five years' purchase; and it is considerably more than 25 per cent. above the value at thirty years' purchase; in short, it is about forty years' purchase of the present income. If this is not an exorbitant price, then we are all mistaken in our ideas of what things are worth. Even in England, the richest country in the world, where a great estate confers social status, and land consequently fetches a fancy price, thirty-three years'

purchase for land is the ordinary estimate in the best of times. It would be absurd to say that water shares can be of higher value than land. Mr. Cross's mistake, as we have said, was that he began his negotiations by announcing that he would not compel the Companies to sell, thus virtually making them masters of the situation. But it is difficult to conceive how he can have persuaded himself that the ratepayers of the metropolis would consent to pay for works some of which are fit only to be condemned, nearly twice as much as investors think them worth.

THE CARL ROSA OPERA SEASON.

ON Saturday last the season of opera in English at Her Majesty's Theatre was brought to an end. On looking back at the results of the season we find but little to regret; and when we remember that Mr. Rosa has been away from his post of manager, we can only say that the work has been admirably carried on by those who have replaced him. Mr. Randegger has evidently spared no pains in superintending the musical part of the undertaking, and, with but few exceptions, Mr. Betjemann has been equally careful with the stage arrangements. There has been no want of interest or novelty in the performances; several operas have been performed for the first time in English; and Hermann Goetz's great work, *The Taming of the Shrew*, has been produced for the first time with an adequate performance in London. This work had the rather curious fate on its first performance at Her Majesty's this year to please the public better than the critics; but further hearing of it seems to have increased its charm for lovers of music of all grades of artistic education. All technical musicians admire not only the beauty of the results, but the great mastery of musical methods by which they are produced. Those who admire music as an art, but who know nothing of the technical part of the subject, find the beauty of the melodies grow upon them as they become more familiar with their somewhat unusual forms; and we think that no person of artistic sensibilities, who is tolerably familiar with the music, would for one moment endorse the accusations of want of originality, dulness, and lack of dramatic meaning which were so freely brought against the work early in the season. Popular success is not always a fair test of merit in art, especially in music; but it is a remarkable fact that in operatic art it is a tolerably trustworthy guide. We believe that, speaking generally, no opera which a good musician would condemn has ever kept the stage, and no really meritorious work has ever entirely failed, though it may have had but little success at first. If this be true, *The Taming of the Shrew* bears the test well, Mr. Carl Rosa having even found it desirable to give one performance of it after the close of Miss Minnie Hauk's engagement, Miss Gaylord, who sang the part in the provinces, taking her place as Katherine. It is to be hoped that the great success of this opera may induce Mr. Mapleson to produce it during the Italian season. It is true that the interest of the work would be injured by playing it with an Italian libretto; but still the music alone would make it attractive, if it were carefully done. But, to make it successful, more care must be given to rehearsal, especially with the chorus, than has been generally bestowed upon the performances during the Italian seasons. However, whether we hear Goetz's work during the summer or whether we have to wait until Mr. Rosa's next season, we may be glad that so good an opera has been written, whilst we regret that an early death should have taken the composer before he had time to do much more work.

Mr. Carl Rosa has, in the course of the season, given some examples of "English Opera," a school which died in early infancy; whether because it was destroyed and swamped by the fashionable rage for Italian music, or whether because there were no composers to carry it on, we cannot say. It is the fashion to treat these slight works with a contempt which they do not deserve, and we even find traces of a vague feeling that it is beneath the dignity of Mr. Rosa and his artists to meddle with such puerile works. We, however, think that Mr. Rosa is right to produce them. On the grounds of expediency he is undoubtedly right, as *The Bohemian Girl*, *Maritana*, and *The Lily of Killarney*—which, though composed by a foreigner, yet belongs to this class of opera—have always attracted good houses. Of course these works are of great interest to the student of development in musical forms; for, although they do not fill in a link in any well-marked line of descent, yet they show such strong leanings to one or two well-marked types that they serve the same purpose in musical history that what biologists call *intercalary* forms serve in the study of the history of animal species—that is to say, we find a fourth cousin, from whose features and character we can guess what some forgotten individual in the direct line of descent was like. Now all three of these works show, first of all, that they sprang from the older English type of ballad opera, which was hardly different from a drama with introduced songs, the action being occasionally accented by one of those peculiar subdued orchestral passages which are known by the name of *melos*. They also in form resemble the style of the French Opéra Comique, except that the concerted pieces are not quite so important; and further, particularly in Wallace's work, *Maritana*, we find much resemblance to the early modern composers of Italy, Bellini being often brought to our recollection in the course of this opera. It is perhaps to be regretted that no work of either of these two schools has been produced this season with which a comparison could be made. *Carmen*, though somewhat closely following the Opéra Comique form, is yet too free from the conventionalities of the school to be a good example. The *Trovatore* of Verdi is the only specimen of the modern Italian school which has been produced; and this, though we are accustomed to look upon it as exhibiting the over-anxiety for smooth and taking melody which is supposed to be the characteristic of this class of opera, yet is far stronger and much more dramatic than the works of Donizetti and Bellini, which the English operas somewhat resemble. Curiously Sir Julius Benedict's work most strongly recalls the ballad opera form; whilst Wallace's most resembles the Italian school. Balfe's work shows us all his well-known faults; but, at the same time, hearing it reminds us that there was a British composer who had the gift of melody perhaps more strongly than any other writer, and we must content ourselves for the present with this boast.

These operas have, we regret to say, not been produced with the same care as the more important works; *Maritana*, in particular, showing great want of rehearsal. Mr. Pew, who conducted, has not that power of instinctively feeling when a mistake is coming and preventing it which distinguishes some conductors. This work gives Miss Georgina Burns more to do than other operas in which she has sung, and we have nothing but praise for her singing of the music. Her acting was conventional, but had ease and brightness. Mr. Maas sang Don Cæsar de Bazan admirably; but his acting of the part was by no means good. *The Lily of Killarney* gives Miss Gaylord a good opportunity of showing her skill as an actress; and her Eily O'Connor was excellent. Her singing also was very good. Several performances of this opera have been given under the bâton of its composer.

We must notice with approval the great reform which has been introduced by this company in the matter of entr'actes; throughout the season, with very few exceptions, they have been quite long enough to rest the ear and the eye without having been so long as to weary the audience. This is a subject we have often discussed, and we see with pleasure this commencement of improvement. We hope that this system may extend to the Italian season. In the course of our remarks on individual performances we have often had occasion to notice unfavourably the English versions of the operas used by Mr. Carl Rosa's company, and we again call attention to the subject. No doubt Italian libretti are not generally of a high order of literary merit, and in their case the English adapter has great difficulties in his way; but they might be overcome more successfully than they generally are. Yet this excuse cannot be offered in the case of German and French opera-books; and the admirable version of Gounod's *Faust*, by the late Mr. Chorley, is a proof that it is possible to produce an English book to an opera which shall have real literary merit. Mr. Troutbeck's translation of the German text of *The Taming of the Shrew*, which we have already commented upon, again shows that good work is possible in this kind of writing. It may be urged that this is a small detail. We think not, and we believe that the future success of opera in English is being seriously imperilled by the weakness and puerility of many of the English versions which are now used.

On the whole, however, this last season has been one of great artistic success, and has done much in spreading the taste for operatic music. We hope that other operatic managers will take to heart the lesson that Mr. Carl Rosa has read to them, and be led to see that the matter of first importance is to give works of interest, and do them thoroughly well; and that if this is done the public are better pleased than they are with one or two great or fashionable singers ill supported, and singing in indifferent works which have been carelessly produced.

REVIEWS.

RHEINSBERG.*

MR. ANDREW HAMILTON is a remarkably agreeable writer; but we confess to having felt some difficulty, on closing the second of these delightful and unpretending volumes, in accounting to ourselves for the attraction which they had exercised upon us. We rather fancy, however, that this attraction was due to the element of the unexpected to be found in them. It is not that they are especially witty, for Mr. Hamilton's efforts in this direction, though frequent and sustained, are not pre-eminently fascinating. Nor is the phenomenon of an entertaining book about a corner of the Mark Brandenburg really surprising; for the Mark is the cradle of an important series of events in the annals of Europe, and around that cradle both legend and history have woven a multitude of interesting associations. What is undeniably noteworthy is to meet with a work full of entertainment, and by no means devoid of instruction, the subject of which has already been in part copiously though incidentally treated by a master hand; for no division of Mr. Carlyle's most elaborate historical narrative is more successful in its way than that in which he deals with the last stage of his Crown Prince's "apprenticeship," and with his spiritual *Wanderjahre*. There is the more reason for congratulating a later writer upon his literary skill in effectively treating such a subject afresh, when it is of a nature which cannot exactly be called inexhaustible, and when he proves unable to shed any new light upon its most problem-

* *Rheinsberg: Memorials of Frederick the Great and Prince Henry of Prussia.* By Andrew Hamilton. 2 vols. John Murray. 1880.

atical points. Mr. Hamilton leaves two questions—not in themselves very difficult to answer roughly, but still not quite satisfactorily solved—very much where he found them; and has nothing of his own to contribute by way of reason why Frederick first would, and then would not, live with his wife, and why his brother, Prince Henry, could serve, but could not endure, him. Although, however, these pleasant pages have not helped finally to set our minds at rest about matters which grave historians have either imperfectly discussed or discreetly evaded, *Rheinsberg* succeeds in recalling attention both to those matters themselves and to the chapters of history to which they belong. Taking advantage of the widely prevalent taste for bits of still life on paper as well as on canvas, and for the quiet methods of an art which understands how to attract with the aid of materials at first sight uninviting if not repulsive, Mr. Hamilton has contrived to give a breath of literary life to the dead palace by the lake, among sand and heath and forest, and, by bringing his scenery home to us with singular skill, to make certain passages of historical biography, momentarily at least, more vivid than even Mr. Carlyle's conscientious use of books had made them. Grateful for this result, we have no desire to cavil at Mr. Hamilton's devices for easing or ornamenting his discursive narrative. The figures or episodes of the guard of the stage-coach, the landlord of the "Rathskeller," the talkative tailor, and the rest of them, must be allowed as part of his stock-in-trade to the author of a work which seems designed to obscure rather than to reveal the fact that he is both a modest and a conscientious historical student. Such Mr. Hamilton's use of his authorities, and indeed the refreshingly accurate way in which he cites them, would alone prove him to be. At the same time, as he assumes the existence of so small a degree of interest in his theme on the part of most English readers, he might perhaps advantageously have assumed a correspondingly scanty measure of knowledge. The very name, for instance, of the Princess who was the *châtelaine* of Rheinsberg during its most brilliant period is hardly mentioned by Mr. Hamilton except in a footnote; though doubtless many of his readers would have been glad to have their memory refreshed as to her antecedents and connexions. It is not every one who can have even Mr. Carlyle at his fingers' ends, though few will be likely to quarrel with Mr. Hamilton's enthusiastic admiration of his great predecessor, to whom his style occasionally offers the sincerest kind of flattery. We cannot help adding that he moves among his references and allusions with the ease of one who really knows German as well as Germany; we have only noticed one (possibly accidental) false German form in this book ("Mecklenbürger" for "Mecklenburger"); and only one (frankly avowed) instance of want of familiarity with German ways. A "cucumber cure" is, or was, no uncommon expedient of German medical treatment; and we believe enjoys high esteem among persons who have happened to survive it.

Landscapes like those which Mr. Hamilton describes with so much tact and skill—solitudes of forest with patches of clearings so bare as to seem "trysting-places for all the winds," large lakes "very lovely but very grave . . . . having in" them "nothing of more transient sadness and knowing nothing of change," and what modern artistic slang would call "sand-symphonies" in drab and grey—must be left to create their impression slowly and gradually; nor will we spoil the total effect from this point of view of the volume before us by piecemeal quotations. The palace of Rheinsberg, and probably the town from which it takes its name, have seen their best days; the forlorn hope of the citizens, the railway, has left them aside; and if the palace itself is as yet neither bodily *abgetragen* nor converted into the Normal School of which Mr. Carlyle had heard rumours, nor put to any other useful purpose, the reason probably is that even the thrifty Prussian administration desired to spare so interesting a monument of the Prussian dynasty. This kind of piety is naturally thought to be more loudly called for in the Mark Brandenburg than, for instance, in the Duchy of Schleswig. Yet even at Rheinsberg it seems to be carried to no superstitious length; and Mr. Hamilton observed with intelligible astonishment the neglected condition of a double memorial erected by Prince Henry to his elder—King Frederick II.'s younger—brother, Augustus William, Prince of Prussia, the great-grandfather of the Emperor William. The Prince was not buried here, and it appears to be uncertain whether his heart was actually placed in the urn which professes to contain his ashes; but in any case it is strange that the cloud which overhung the unfortunate Prince's last days should have been allowed, as it were, to settle round the monument of his younger brother's splenetic affection. For in honouring the memory of Augustus William, Prince Henry was casting an oblique reflection upon the King who had attributed to the Prince of Prussia's failure the greater part of the misfortunes of a perilous period in his struggles.

As is well known, the historical associations of Rheinsberg belong only to a relatively short part of Prussian history; and neither the palace nor the town has any antiquarian interest to speak of, dating from earlier times. A robuster faith than any which these latter days can sustain would be requisite for a revival of curiosity with regard to the legend of Remus, the brother of Romulus, as the founder of Remusberg, Remsberg, or Reinsberg, though Frederick the Great desperately clung to his belief in the silly tale, in spite of the critical sneers of Voltaire. It was probably an invention of the early part of the seventeenth century—of all the ages of German pedantry the most extravagantly pedantic. Mr. Hamilton has been at the trouble of tracing the tale as near to its fountain-head as possible, having had in his hands "the only documentary evidence known" on the subject—a volume of the *Miscellanea Lipsiensia* of the year 1717, in which Christopher Pyl, M.A., rector of the Grammar School at Antlam, in Pomerania, reprints (apparently in good faith) a tract entitled

"Sepulchrum Remi, fratris Romuli, in monte Remi, vulgo Remsberg. nuper detectum, erutis binis marmoribus uno vetustissimo, altero recentiore, Quibus pervulgatus ille error de Remo, a fratre interfecto, confutatur." The "vetustissimum marmor" in question "was about three-quarters of a Brandenburg ell in length and half an ell in breadth. On one side of it were six birds in relief, "without doubt the six vultures which appeared to Remus," proving that "of his own accord he had left Rome to his brother, and, followed by a great multitude of shepherds, had penetrated into these regions, where, in this delightful spot, he had settled down, and spent the rest of his life, and died." On the other side was an inscription, many of the letters of which were effaced and illegible.

What evidence could be more conclusive? and how one is struck afresh by the truth of the observation that the points of view are many and various from which the credibility of early Roman history may be discussed! Prince Frederick told Voltaire as a matter of fact that two monks, sent out by the Pope, had come to Rheinsberg in quest of the place founded by Remus, and had caused search to be made for his ashes in the island in the lake which is called the Isle of Remus to this day. Prince Henry drew the island into his grounds in 1771, before which it had been in the hands of a tenant; and crowned the *Arx Remi* with gimcracks in the true Twitnam style. *Petits soupers* were discussed in a Chinese pagoda in honour of the elder brother—him of Rome, not him of Potsdam; now all has vanished, and Remus is as completely forgotten as Augustus William.

According to Mr. Hamilton, "some have thought" that the whole Remus business was "got up as a compliment" to Justus von Bredow, who early in the seventeenth century was lord of the manor of Rheinsberg. He sold it to the Lochow family (every name "ends in ow" in those parts); on the dying out of which, after terrible sufferings undergone by the district in the Thirty Years' War and the times of the Great Elector, it fell to the bestowal of that prince. He gave it to an officer, who soon sold it to Privy Councillor Chenevix de Béville, whose son in his turn sold it in 1734 to King Frederick William I., when the latter in his forgiving mood was anxious to gratify his son, the Crown Prince, by purchasing it for him as a residence. M. Chenevix de Béville was one of the many Huguenots who left France before the Revocation of the Edict of Nantes; while two cousins of his took flight to England and Ireland, where the name Chenevix still survives in an honoured conjunction. It is not a little curious that Rheinsberg, which was successively to become the residence of two princes who cherished, each in his own way, so warm a predilection for things French, should have French associations of a still earlier date. Mr. Hamilton informs us that "more refugees had settled in the county" (lordship?) "of Ruppin than in any other part of the Mark, the devastations of the Thirty Years' War having thinned the population more than elsewhere. Whole villages were repeopled by the French." To Rheinsberg French refugees were more especially attracted by the French Protestant chaplain whom the Bévilles had brought with them into the Middle-Mark, and by the place of worship which had been built for his ministrations. It appears to have been in the capacity of regular French preacher as well as almoner to the household that a divine was invited to Rheinsberg by the Crown Prince Frederick, who plays some small part in Frederick's biography, and was ultimately minister of the French Episcopal Church in the Savoy. Jean Deschamps was a pupil of the famous Wolff, the author of "the best philosophy going," and had translated one of his minor works. In Deschamps's Sunday services a more volatile divine seems afterwards to have taken occasional part—Jordan, who was, like Deschamps, a Frenchman born in exile, but who appears to have been a general utility friend and companion of the true native *abbé* type. He was a man of books, if not of learning; and, while he contributed to the Prince's pleasures, he helped to manage his business, particularly the very important loan department. For Frederick's finances were in chronic disorder, and his loans were at times of a nature not unlikely to involve him in worse than pecuniary embarrassments. Jordan is thus invited by his royal patron to return to the sphere of his Sunday "duty" and everyday pleasures:—

Notre petit prêtre à rabat
Vous marque son impatience;
Il veut, dit-il, votre présence
Pour célébrer un sien sabbat
Avec grande magnificence.
Son marguillier, ce petit fat,
Prétend en fredons marotiques
Psalmodier de longs cantiques
Pour amuser les auditeurs;
Ils feront bailler les apôtres,
Qui, je crois, du goût de nous autres,
Connaissent des plaisirs meilleurs.

The style *à la* Clement Marot was certainly not that which the Crown Prince preferred either in or out of chapel; and perhaps the descendants of the Huguenot refugees at Rheinsberg and in its neighbourhood may have shaken their grave heads at some of the French company brought down to the Prince's little Court, and at some of the elaborate frescoes painted in the palace by the Parisian master, Antoine Pesne. The mere fact, however, that the Crown Princess was so happy at Rheinsberg shows that the laws of propriety were in no marked degree violated there; moreover, the Crown Prince was still under a vigilant, though now kindly, fatherly eye. And, in truth, Frederick's nature, as well as his circumstances, inclined him to self-restraint; and in this respect, at all events, his brother, Prince Henry, was more genuinely a Frenchman than he. During Prince Henry's occupancy of Rheinsberg there was less of litera-

ture and more of gaiety in the palace and its precincts than during his brother's quadriennium. A "Court of Opposition," as Mr. Hamilton calls Prince Henry's, is usually a lively one—as the Suffolk Correspondence and other illustrations abundantly show. But Prince Henry, besides being as musical as the King, was as fond of theatricals as of music, and had a French theatre at Rheinsberg after that at Berlin had been broken up. In his later years two visits to Paris completed his transformation into a Frenchman; but, though the friendships which he had formed were naturally on the side of the old *régime*, he had independence—or perversity—of mind enough to take views of his own of the French Revolution and of the proceedings of the Coalition. Though the hospitality of Rheinsberg was at one time or another freely extended to the *émigrés*, the Prince kept both his ears and his doors open to other visitants, and after the peace of Basle received at Rheinsberg an active, and as people at Berlin thought dangerous, member of the French Embassy. Prince Henry's influence is supposed to have helped to accomplish the pacification in question—about as sorry a reminiscence, after all is said, as could connect itself with the name of any Prussian prince.

As already observed, Prince Henry's antipathy to his great brother, though copiously enough illustrated in Mr. Hamilton's second volume, receives no new explanation there. Prince Henry's nature was, like Frederick's and their father's, altogether despotic; in a different dynasty and under different circumstances the jealous hatred which could bear no brother on the throne might have found even more violent ways of expressing itself. Still it was going tolerably far, even after the hero's death, to set up a monument at Rheinsberg—"the biggest, gravest, and most solid of" the Prince's "architectural undertakings"—"to the memory of the Prince of Prussia and the other heroes of the Seven Years' War, with the exception of the King." One other portrait is of course also, though from a different cause, wanting on it—that of the victor of Freiberg, the last and (if the world would but have believed it) the one decisive battle of the Seven Years' War. More interesting to posterity than this monument of Prince Henry's unextinguishable jealousy would have been the Commentary which he wrote on Frederick's history of the war itself, but which (fortunately, perhaps, for his reputation) he ordered to be destroyed after his death. Swift's commentary on Burnet would have here found an equal in bitterness, if not in roughness of tone. Short and unbloody as the war of 1778-9 (the war of the Bavarian Succession) was, Prince Henry found time in it for resigning his command; and after the death of Frederick it was not long before the relations between his successor and his brother were not very different from what those between the latter and himself had been.

Prince Henry's conjugal relations, like many things in his life, ran curiously parallel in a certain measure to those of the brother whom he learnt to hate so bitterly. Prince Henry and Princess Wilhelmina kept court together at Rheinsberg for just the same period of time as the Crown Prince and his consort had done (four years) with tastes not very different, and under circumstances of income quite as uneasy. The Princess Henry seems, however, to have been extremely attractive, a lady of *esprit* and beauty, known at the Berlin Court (as Mr. Hamilton states on an authority to which we rejoice to find him frequently refer—the charming Memoirs of Countess Voss) "by a whole list of endearing epithets —'La Belle Fée,' 'La Divine,' 'La Toute Divine,' 'L'Incomparable,' &c." In the Crown Prince's time, when the Rheinsberg Court had been a very *pays du tendre* for the invention of poetic names and epithets, a more modest designation had belonged to the Princess to whom Frederick had given his hand in an obedient moment, and of whom, during his father's lifetime, he continued to appear a contented husband, after having been a far from enthusiastic bridegroom. Other princes have on their accession to the throne rapidly concluded marriages which the policy of their predecessors had delayed; Frederick II. adopted the converse process. It is to be regretted that the present opportunity has not been taken to present a more distinct portrait of Queen Elizabeth Christina, especially as Mr. Hamilton refers to a monograph concerning her. We are not altogether inclined to take her insipidity on trust; and though her pietism may not have been to her husband's taste, yet he might have allowed his wife to read or even to write psalms, as the Great Elector had done before him. And, upon the whole, had it suited the despotic nature of King Frederick II. even virtually to own himself in the wrong, there seems reason to believe that he would have put an end to his separation from his Queen before his death. He said of her favourite, the pious and sentimental Gellert, that he was the most reasonable of all German men of letters; and some praise of the same kind seems to have been due to the wife who had remained "Constance," though he had ceased to be "Constant," as in the pleasant artificial days of the Order of Bayard at Rheinsberg.

DOUGLAS'S CONFUCIANISM AND TAOUISM.*

THE systematic and unprejudiced examination of the non-Christian religions of the world must tend to throw light on the nature of Christianity itself. This must be admitted by all who are not prepared to maintain that religion is a matter which lies wholly beyond the range of thought and inquiry; and even for those who claim the most unqualified submission to their own faith the character of the faith professed by other peoples or nations must be a subject of supreme importance if the former is to grapple with and overcome the latter. Between all the religious systems of the world it will be seen that there are points of contact and agreement as well as points of difference and antagonism; and the true method of dealing with false or imperfect systems can be reached only after an impartial historical scrutiny, which shall clearly show the causes and the consequences of their failure. The spirit in which this inquiry has been undertaken and in no small measure already carried out is one of the most encouraging signs of the present time; and among the many volumes which embody the results of the examination thus far made none is likely to be more useful, and few probably will be found more generally interesting and attractive, than that of Mr. Douglas.

The Englishman and the Chinaman stand at almost opposite poles of thought; and to the former the ways of the latter, where they are not actually disagreeable and repulsive, are apt to appear ridiculous. The attempt to produce agreement between oil and vinegar is of not much use; and it may at once be admitted that there is much in the processes of Chinese speculation into which Englishmen will never enter, and with which they cannot be expected to sympathize. Chinese names convey to them little meaning or none; and for this reason Chinese geography is but vaguely and feebly impressed on their minds. It is not an easy task to distinguish accurately between the provinces of Chin and Ching, of Tsin and Ts'in, of Ke and K'e, or to attach a definite idea to the almost endless series of monosyllabic monarchs who in their goodness or their badness seem to follow certain stereotyped fashions, and to exercise a monotonous influence on the fortunes of their country. Yet the feeling of repulsion, which may sometimes rise almost to disgust, at the seeming vapidity of Chinese philosophy, depends to a certain degree on the terms used in describing it. The great Chinese teachers have all been disposed to concern themselves especially with outward things, and we are scarcely able to throw ourselves into the mind of a man to whom a posture is everything, and for whom the proper arrangement of sacrificial vessels is the most important concern in human life. We may therefore be tempted to smile when we find Confucius telling his son that if he does not learn the rules of propriety his character cannot be established, or declaring that it is only a superior man who can arrive at the knowledge of his own destiny. Yet we should cease to see anything ridiculous in these statements if for "propriety" we substitute the familiar τὸ πρέπον and τὸ καλόν, and for the "superior man" the well-known καλοκἀγαθός of the Greeks. But the history of Chinese philosophy (of Chinese religion there can scarcely be said to be any history at all) has a direct bearing on some of the most momentous controversies which have agitated the schools of Western thought; and it further exhibits certain features which are perhaps not seen elsewhere in such startling prominence. The present condition of the two great systems which have exercised most influence in China is one thing; the change which these systems have undergone since the times of their founders is another and a very different thing. Both involve points of great interest; but the contrast between the present and the past is far more instructive, and the inquiry into its causes will much more fully repay the student for the attention which he may give to it.

This contrast Mr. Douglas has brought out with the greatest clearness, and no part of his book is likely to be more practically useful than the chapters in which he shows the present phases of Confucianism and Taouism in China. It is well to know what these systems were intended to be by the thinkers who propounded them; and for the history of religion, and of matters bearing on religion, there can be few subjects of greater importance. But for the teacher and the missionary the first consideration must be that of the form of thought with which he must himself be brought into contact. Of Confucianism it may be fairly said that it never was and never professed to be a religion. It propounded a set of ethical rules, it regulated the postures of the body in all occupations and at every hour of the day and night, it enjoined the rigid observance of a minute ritual which was wholly unconnected with the attitude of the heart or the affections of the worshipper, it inculcated an ethical system in the form of dogmatic axioms. These precepts exalted the sovereign, and laid stress on the merits of loyalty; and thus, although the sage reserved to the subject in the last resort the right of rebellion against worthless emperors, the whole system became an admirable weapon for rulers in possession, and these were not slow to recognise the benefits which they might receive by adopting and upholding it. The canonical books in which this system is drawn out have become the foundation of all Chinese literature, and have moulded the thoughts and language of the whole Chinese people. Indeed it would be scarcely an exaggeration to say that from the days of Confucius there has been no thought except that of the philosopher, if we put aside the system which for a time stood out in open antagonism to it, but which, for all practical purposes, has now become a system of mere charlatanism and jugglery.

The history of these two systems shows, in truth, how incompetent the Chinese are for any sustained and exhaustive thought. The philosophy of Laou-tsze was certainly an attempt to go pretty far down towards the root of things; but his language pointed to a direct connexion between right conduct and length of days; and the vaunted possession of a talisman or elixir of life became, after

* *Non-Christian Religious Systems—Confucianism and Taouism.* By Robert K. Douglas, of the British Museum, and Professor of Chinese at King's College, London. Published under the direction of the Committee of General Literature and Education appointed by the Society for Promoting Christian Knowledge. 1879.

no long time, the most prominent characteristic of the system. The abstruser portions of the teaching, whether of Confucius or of Laou-tsze, were thrown off by the popular mind as easily as water dries off a duck's back; and their attention was wholly fixed on stories which spoke of Laou-tsze's servant as living with his master for two centuries, and as becoming a heap of dry bones when the philosopher, making him lean forward, drew the talisman out of his mouth. According to the tale the servant was restored to life, just as Olger the Dane was restored to his youth when the magic ring of Morgan le Fay was placed upon his finger, and the impulse thus given to popular credulity has only acquired strength with the lapse of ages. With the notion of the talisman the idea of the transmutation of metals sprang up in a natural order, and thus the Chinese were furnished with the complete system of Western alchemy. The whole visible world was peopled with demons, who could be kept at bay only by charms and spells worn on the person of the believer. "All mountains," said a well-known Taouist doctor of the fourth century, "are inhabited by evil spirits who are more or less powerful according to the size of the mountain. If the traveller has no protection he will fall into some calamity. He will be attacked by sickness, or pierced by thorns, or witness strange sights and sounds. He will see trees moved, but not by wind, and stones will fall without any apparent cause from impending rocks, and will strike him." After some more details of the same kind, the doctor winds up with the counsel that the traveller should not only bear a suitable charm on his person, but should fast and purify himself for several days before undertaking the journey. The present condition of the Taouist priests, and of the devotees more immediately connected with them, is said to be very deplorable. The nunneries are described as haunts of every vice; and it may be nothing less than the truth that "the modern Taouists have sunk lower in the estimation of their fellow-men than any but the most degraded of idolaters" (p. 287). Still it is a strange fact that, in such a state of things, the book most diligently circulated amongst the Taouist population should be the *Kan ying peen*, or the Book of Rewards and Punishments. Of the whole text of this manual Mr. Douglas has given a translation. It must certainly be admitted that of the multitude of precepts contained in it by far the larger number are of a sort which must have the approval of Christians generally. Among these are the following:—

Practise righteousness and filial piety.

Have pity for orphans, and show compassion to widows.

Rejoice at the success of others, and sympathize with their reverses, even as though you were in their place.

Do not expose the faults of others. Forego much and take little.

Bestow favours without expecting recompense.

The negative precepts are in many instances equally wholesome:—

Be not forgetful of benefits.

Do not reward the unrighteous.

Do not overthrow another that you may take his place.

Do not make crooked that which is straight, nor make straight that which is crooked.

Do not throw your own fault upon another.

Do not seek your own advantage at the expense of others.

Do not seek to gain promotion by deceit and fraud.

There are, of course, other precepts, both positive and negative, which exhibit the distinctive features of Taouist talismanic superstitions, and encourage a belief in magic; but in spite of these it is a perplexing fact that this book should be "the one above all others which exercises influence over Taouists of the present day," unless, indeed, we suppose that to the large majority of precepts which must, so far as they are obeyed, counteract these superstitions, no attention whatever is paid.

For the student of the history of religious thought the most interesting portion of Mr. Douglas's volume will be that which exhibits the system of Laou-tsze as a protest against the dead formalism of the teaching of Confucius. This protest is just as significant whether we grant or deny the historical existence of Laou-tsze, and his alleged intercourse with his more worldly and, in the end, more successful rival. When a disciple came to him to ask counsel for the sovereign of Wei, Confucius insisted that the matter of the first importance was to rectify names. On being asked to explain an answer which the hearer thought very unreasonable, Confucius added:—

If names be not correct, language is not in accordance with the truth of things. If language be not in accordance with the truth of things, affairs cannot be carried on successfully. When affairs cannot be carried on successfully, proprieties and music will not flourish. When proprieties and music do not flourish, punishments will not be properly awarded. When punishments are not properly awarded, the people do not know how to move hand or foot. Therefore the superior man considers it necessary that names should be used appropriately, and that his directions should be carried out appropriately. A superior man requires that his words should be correct.

Such advice as this to Laou-tsze or to the founders of Taouism, whoever they may have been, seemed little better than husks to be thrown to swine. He rebelled against the dominion of mere words, and insisted that things are only labelled when men feel that without these marks they have no hold on the reality. "What is the groundwork of the Book of Changes?" asked Laou-tsze of Confucius. When the latter replied that it treated of humanity and justice Laou-tsze indignantly answered:—

The justice and humanity of the day are no more than empty names; they only serve as a mask to cruelty, and trouble the hearts of men. The pigeon does not bathe all day to make itself white; nor does the crow paint itself each morning to make itself black. . . . To what good is humanity and justice? You are like a man who beats a drum while searching for a truant sheep.

The complete opposition between the two men is admirably exhibited by Mr. Douglas, who remarks that Confucius

would have men practise humanity and call it humanity; he would have men dutiful to their parents, and call it filial piety. . . . Laou-tsze, on the contrary, held that when men professed to be humane, filial, and loyal, it was a sure sign that the substance had disappeared and that the shadow only remained. . . . If the pigeon began to bathe itself, and the crow to paint itself, would it not be a sign that they had lost their original colours?

For twenty years Confucius sought the *Taou*, or virtue, or whatever else it may be called, of Laou-tsze, but failed to find it. Laou-tsze was at no loss to account for his failure:—

If *Taou* could be offered to men, there is no one who would not wish to offer it to his prince; . . . if it could be transmitted to men, there is no one who would not wish to transmit it to his children. Why then are you not able to acquire it? This is the reason; it is that you are incapable of giving it an asylum in the bottom of your heart.

The difference between the two teachers was vast indeed. While the one was busying himself with names, the other was warning his disciples not to judge their fellow-men:—

Be content to know yourself . . . and learn not to impute wickedness to the unfortunate. If one man dies and another is preserved alive, why point at either of them as the object of Heaven's hatred? A truly good man loves all men and rejects none . . . but bad men are the materials on which he works, and to bring such back to *Taou* is the great object of his life.

That the teaching of such a man should have been perverted into a system of charms and spells is a catastrophe which must excite in all lovers of truth a feeling of profound disappointment and regret. The causes which rendered this change inevitable are well drawn out in Mr. Douglas's pages.

THE HEART OF HOLLAND.*

THE Heart of Holland stands the best test to which a book of travels can be put. It raises in the reader a strong desire to follow in the footsteps of the author, and to see with his own eyes all the spots which are described to him by another. We had not reached the end of M. Havard's volume before we had got out our maps, our Bradshaw, and our Baedeker, and planned another trip to Holland. We are glad to say that in this, the third of his narratives of journeys in the Low Countries, he has to a great extent avoided the errors into which he fell in his second volume. *The Dead Cities of the Zuyder Zee* was, as our review of it showed (see *Saturday Review*, November 13, 1875), a very interesting volume. But in *Picturesque Holland* we had to point out (*Saturday Review*, January 20, 1877) that the author had "fallen a prey to that common danger of authorship, a first success." He started on his second trip with a great political purpose, and he examined questions which could just as well have been discussed had he never stopped outside his own study. In his present journey he certainly brings in not a few quotations from historical writers which are somewhat wearisome. His history, moreover, is not always accurate. We Englishmen, at all events, are certainly amazed to read that "at every period of its history Flushing was a standing menace to maritime Albion." Almost as much are we surprised to learn that we "feel a resentment towards the memory of that great man, Michael van Ruyter." It is amusing also to see how ingeniously M. Havard turns the tables upon us in a way we could not have looked for. Certainly we had always thought it a just source of pride that, in the days of the first Napoleon, our country had fought and beaten from every sea the allied fleets of almost the whole Continent. The real courage, it seems, was all on the other side. "At the epoch of the wars of the Empire," M. Havard writes, "the town of Flushing may claim a large share of the dauntless deeds of that unequal strife in which the Continental navy endeavoured to make head against the unrivalled fleet of England." He might with almost as much reason tell us of that unequal strife in which the Spanish monarchy endeavoured to make head against the unrivalled Seven United Provinces. One or two of the historical digressions might very well have been omitted by the translator, especially one nearly ten pages long, in which is traced the connexion between France and Middelburg. This portion of history may likely enough, to use the author's words, be doubly interesting to Frenchmen. Nevertheless, for Englishmen it is somewhat dull reading. A great deal, however, of the historical matter brought in by the author aptly illustrates the spots which are visited, while some of it is altogether original. Thus M. Havard publishes a manuscript note, which was shown him by a Dutch friend, of the siege of Middelburg in 1574:—

"I, Andries Mathieusz," says this note, "I married my wife on the 21st of February, 1574, on the very same day when this town of Middelburg was given over into the hands of the Prince of Orange, and to celebrate our wedding we had cakes of linseed (*lysaet wafelen*), and horse's flesh at two schillings the pound, a pound of bread costing six schillings, and at this price it is not easy to have any; likewise a pound of butter at four schillings."

M. Havard touchingly adds, with a remembrance of the siege of Paris, "This note will awaken terrible recollections, hardly seven years old, among ourselves."

* *The Heart of Holland.* By Henry Havard, Author of "Dead Cities of the Zuyder Zee" and "Picturesque Holland." Translated by Mrs. Cashel Hoey. With Eight Illustrations. London: Richard Bentley & Son. 1880.

The chief interest of the book lies in the lively and pleasant descriptions which the author gives of the adventures of himself and his fellow-travellers, and of the places they visit. This time they confined their explorations to the province of Zealand. In spite of extension of the railway service, communication is still by no means easy there, while between many of the more outlying parts there is no regular system of transport. They hired, therefore, a large boat, or rather a small ship, a Dutch *tjalk*. This they fitted up in a luxurious manner, and cruised about in it from island to island. It proved by no means trustworthy, however, and took to leaking badly. The crew, moreover, had become very surly by the time the travellers were near the end of their trip. They had still a stormy passage to make up the Scheldt, and they were greatly puzzled what course to take. Happily they were relieved from their difficulties by a mutiny among the sailors, who refused to do any more work. M. Havard and his friends were only too glad to be able to get rid of them and their ship, and, packing up their goods, made the rest of their trip on land. Our passion for scenery has set in so strongly towards mountains that the belief is commonly held, almost as an article of faith, that, without at all events good-sized hills, there can be no beauty. M. Havard fights fiercely against this superstition. He has, he says, in his rambles visited the northern frontiers of Sweden and the southernmost point of Sicily. But nowhere, he maintains, either in the North or the South, have his eyes "been surprised and rejoiced by equal intensity of colouring, at once bright and delicate, by a blending of tones so fine, harmonious, exquisite, and yet incomparably bold." Yet the greater part of the province lies below the sea-level, while the only heights it can boast of are the sand-hills scattered along the west coast. What is that to M. Havard, who thus eloquently and, we will add, truthfully defends his beloved Low Countries?—

Let us, at once and for ever, get rid of the prevalent notion that the skies of the Netherlands are grey, dull, foggy, smoky, and opaque. Let certain critics at once and for ever discard the astonishment which they, and their predecessors for the last fifty years, have been in the habit of expressing, that a school of masterly colourists should have existed in a country which is popularly believed to be destitute of both light and colour.

M. Havard likes the people almost as well as the islands they inhabit, and almost better still does he like the houses and villages and towns they have built for themselves. Each place that he comes to seems better than the last. Some of the towns that interest him the most are scarcely mentioned in Baedeker. Veer is not mentioned at all, yet to Veer M. Havard gives nearly two whole chapters. This old ruined town "seems to say, 'Before you look at me as I am, remember what I have been, and, above all, what I hoped to be.'" It still can boast of its gigantic church and majestic belfry, its lofty trees and red roofs; and these at times, according to the English translator, are all steeped in scintillating radiance. "Sparkling," we venture to suggest, would better suit so old-fashioned a place and people. It still can show a beautiful fountain covered by a delightful little building that is thoroughly Gothic. The travellers looked for something else. They looked for "some chattering housewife in the costume of the middle ages, the large Flemish collar and the little cap, coming along the road, with her shining copper pail hanging over her arm." They listened for some song of those old days, "warbled by a laughing and still innocent Marguerite, who will presently lean on the margin of the granite basin, and dream of the unknown. But no! echo remains mute, the fountain is deserted." The lines of streets are in many places marked only by the avenues of trees. Houses are being pulled down or are left to fall of themselves. They went over one lofty house on all the floors of which were huge rooms, and which had a spacious court and a garden. The rent was about three shillings a week. The Town Hall nevertheless is kept in good repair. "The dark brown wood carvings, the great benches with their red cushions, the chair of justice, with its desk, back-cushion, and rod, emblem of justiciary authority, are exactly the same as they were when the last sentence was pronounced by the last 'Magistrat.'" It can boast of a great curiosity—the famous cup which was given to the town in 1551 by Maximilian of Burgundy. In 1867 this cup was exhibited in Paris, and the enormous sum of 100,000 francs was offered for it. Yet the Burgomaster and Aldermen of this poor decayed town had strength of mind to refuse the offer. In the register M. Havard was shown the record of the marriage of Mynheer Hugo de Groot. In many of these places it might be difficult to find a lodging, unless one followed M. Havard's example, and went in one's own boat. Even when an inn can be found, it is not always the case that a dinner is to be had. Thus in the Hôtel of Commerce at Flushing the travellers were at first charmed by the welcome they received from Mynheer Peeters, the landlord. He had heard of their being in the island, for the fame of the party had spread. They asked for dinner:—

"There are so few travellers at this season," said Mynheer Peeters, "that I have no table d'hôte!"

"No matter. You can let us have a private room and a dinner all to ourselves."

"No," said he with sullen gravity, "that would upset the house, and I don't want to have everything turned upside down!"

I confess that I looked at this man with stony stupefaction. An innkeeper refusing to let travellers have their dinner! My hands fell helplessly down by my sides. Afterwards, a person to whom I related this anomaly and our amazement, said gravely, "Peeters is well-to-do; he is rich." What a country must this be in which wealth serves as an innkeeper's excuse for such an answer!

The landlord of the Abdy Hotel at Middelburg does not carry severity to quite such a height. He is indeed "stern of countenance and majestic of bearing, and belongs to that class of Zealand hotel-keepers who consider that they exercise a priesthood rather than a profession." In his house all meals take place at fixed and immutable hours, and nobody ever thinks of disputing them. "If you were to ask for a cup of tea at noon, it would be proposed that you should wait until nine o'clock in the evening." The Governor of the Province once took up his residence there, while the Government House was being got ready for him. After some while the landlord pointed out to his Excellency that, though he had a palace, yet he lodged at his inn. "Many unfortunate travellers, not so well off as your Excellency, knock at my door every night; and I am obliged to refuse them admittance. Is this just?" The Governor asked what it was he wanted him to do? "'I desire,' replied Mynheer Bularys respectfully, but firmly, 'that your Excellency should go and live at your palace.'" Yet if the landlord would allow a weary man to stay there for a few weeks, we know not where, if we may trust our author's account, he could better find repose. "Never," M. Havard writes, "was there a dwelling so conducive to meditation." To reach it the traveller has to thread a perfect maze of streets, and pass under a whole series of arches. "It is like penetrating into some fortress, which done, one finds oneself in a wide space, shaded by fine trees, and surrounded by venerable Gothic buildings." The fair was being held in Middelburg when the travellers were there, and they were much struck by the magnificence of the Dutch merry-go-rounds when compared with "the humble wooden coursers of our (*i.e.* French) fairs." Yet exactly such a machine as excited M. Havard's wonder have we ourselves seen in the great Easter Fair at Rheims.

Everywhere in Zealand he was pleased with the friendly manners of the people. "If," he writes, "a peasant meets a foreigner, he makes every possible effort to understand him." He draws a distinction between the manners of the Zealanders and the people of the province of Holland. We are glad to learn that this distinction exists, for the only time that we ever ventured on a Dutch phrase we certainly found that no effort was made to understand us. We had lost our way in one of the northern towns—we forget which—and night was coming on. Armed with a sentence from our Baedeker, and putting into our features as affable an air as we could command, we thus addressed an aged citizen:—"Welke is de korste weg naar, &c.?" The old gentleman gazed at us with alarm, and then hobbled off as fast as he could. Somewhat discouraged, we next applied to a schoolboy. He cast upon us one frightened glance, and fled in terror. Our spirit failed, and never since that evening have we been daring enough to venture on speaking Dutch. When we go to Zealand we shall take heart again. We shall make our first attempt at the village of Wormeldingen, where, according to our author, the men have always a kind word for the stranger, and the women a pleasant smile:—

You would never meet a peasant or a village girl upon the road without having a cheerful "good day" from them, and if there were many of you, they would not only say "*Gorden dag*" in the singular, but they would give you a complex and plural greeting: "*Dag drie*," if you were three; "*Dag vier*," if you were four; that is to say, "Good day to the three of you," "Good day to the four of you," and "*Dag zamen*," which means "Good day together," if there were but two. Sometimes a roguish boy (there are such in every country) will salute a traveller who is going along with an ass or a dog with his "*Dag zamen*," but we must not grudge people their harmless joke, and this one is too inoffensive to vex anybody.

We must not forget to say, by way of conclusion, that the translator has, on the whole, done her work well. Some of her sentences certainly too much betray their French origin; and now and then she uses such words as "scintillating" and "shimmering." Nevertheless we have read the book with a good deal of pleasure, and we feel sure that many a reader will feel indebted to her for thus introducing them to the *Heart of Holland*.

RECORDS OF THE CITY OF OXFORD.*

THIS is a very valuable book, and in matter, arrangement, and outward form it is most creditable to all concerned. Though Oxford is not the most important city in England, it may fairly be said that the records of her municipal life are more interesting than those of any other city could be, because they are the records of an incessant struggle with a rival power within her walls:—

Other boroughs [says Mr. Turner's preface] have had from time to time to defend their rights and liberties against encroachments of those possessing wealth and power; but however potent the antagonist might be, a borough could offer a resistance with far greater chance of success in most cases than when that antagonist was side by side with it, and when each day brought his claims into immediate contact with its own.

And what is especially curious is that the most determined attempt to humiliate the city of Oxford and subject it to the University was made at a time when all other English boroughs had long since achieved their freedom. The century of controversy, if not of actual fighting, of attempts to fasten the yoke and

* *Selections from the Records of the City of Oxford, with Extracts from other Documents illustrating the Municipal History: Henry VIII. to Elizabeth* [1509–1583]. Edited, by authority of the Corporation of the City of Oxford, by William H. Turner, of the Bodleian Library; under the direction of Robert S. Hawkins, Town Clerk. Oxford and London: James Parker & Co. 1880.

attempts to throw it off, was for Oxford not so much the thirteenth as the sixteenth. Mr. Green has shown both in his History and in his paper on the "Early History of Oxford," how the moment when the University was beginning was the moment when the city also was emerging into a prosperous municipal life. In course of time the "Chauncellor and Schollers" changed all that, and formed within the boundaries of the city a great privileged class—a class with its own courts, almost its own laws, and with its own ideas of the value of the rights and liberties of citizens. Again, as time passed by, the obnoxious privileges became modified, and various Royal charters during the fourteenth and fifteenth centuries did something to emancipate the city from the sovereignty of the Chancellor. But the day came when a Fellow of Magdalen became the first man in the kingdom; and Wolsey was not the man to forget his old University or to refuse to do it a good turn. The Charter of 1523, granted by Henry VIII. at his special request, is for the City of Oxford literally a charter of servitude; the granting of it was the signal for a period of wrangling and dispute which lasted well into Elizabeth's reign. It is this very period, a period of exceptional interest, that is covered by the volume before us. All the earlier records, save a few charters and grants, are irrecoverably lost; for the Council possessed no muniment room, and seems never to have entered its own proceedings in a book before the year 1519. Thus the history of mediæval Oxford, as distinguished from the Oxford of the sixteenth century, has to be gathered out of scanty and scattered materials, for nothing exists on the spot. It is of no use to lament the carelessness of Corporations, the criminal neglect of the town-clerks of the past. We must be thankful that here at least we have the existing records—or a first instalment of them—in print, and that the task of preparing them has fallen to such an expert in manuscripts as Mr. Turner, and so enlightened a citizen as Mr. Hawkins. It is only to be hoped that another volume, giving us the Oxford of the Civil War, will follow in due time.

The quarrels between Town and Gown are not the only matters of interest with which these records deal, but they are the most copious and deserve to be first noticed. Even in 1517, six years before Wolsey's Charter, we have a petition from the city to the King, complaining of the way in which the provisions of the Charter of Edward III. are evaded. That Charter had limited the privileges of the University to "clarks and their menyall men," and such specified trades as furnished the University exclusively—limners, stationers, manciples, and cooks; but now in any trial in the Mayor's Court the scholars have a way of interfering, and of withdrawing the culprit, "be he a stranger or privie, tayloure, glover, cobbler, fisher, boocher, carter, or collier," by declaring him to be a "menyall" of their own. But small matters of this kind disappear from view when Wolsey's Charter is granted. From the sixteen articles of the Charter we quote two or three:—

> 10. Item, yf any priveledged person by processe from the prynce be it in the King's own cause, be arrested or imprisoned, the Maior and bailifes upon notice of ye Vice-Chauncelor imeadiatlye shalbe delivered without fee uppon payne of xxli.
>
> 11. Item, it is also graunted unto the Chauncelor, Scholers, and ther servaunts, minysters wth ther howshould, and all other priviledged persons, may make and exercise all manner of byinge and sellinge, and exercise all manner of occupation wthin the towne of Oxon and suburbs of the same, as burgesses maye.
>
> 15. Item, yt is further graunted that for any sentence in any judgemente just or unjust by the saide Chauncellor, Commyssarie or his deputie, by any of them pronounced against any person shalbe holden good whether it be just or unjust, and for the same sentence so just or unjust that neyther the Chauncellor or his deputy or any of them shall not be drawen out of the Universitie for false judgment, or for the same vexed or troubled by any writte comandemente of the Kinge, or any manner of meane whatsoever, nor afore the King's Commissioner or his Justice in any courte upon payne of xxli as often as.

Small wonder that many pages of the book should be filled with the protests of the city against these new bonds. The Chancellor's commissary was not too gentle in the assertion of his rights.—

> If any that pretend to have privilege of the University do any trespass, owe any money, to any inhabitant of the said Town, the Commissary useth to commit to prison the party to whom the debt is owing, or the trespass committed, there to remain until he hath found surety that he shall not sue for his recompense and dewtie according to the King's laws, but only before the same Commissary, contrary to the common laws of this realm and divers statutes provided in that behalf.

The town trades found their customs invaded, and the commercial system of the time overturned, by an enemy worse than cooperation. The consciences of the Mayor and Bayliffs were brought into "perilous danger" by their having to swear before the Vice-Chancellor an oath which contradicted an oath that they had sworn before the Barons of the King's Exchequer. They must have the Charter revoked and their old liberties and franchises restored. The King wished to refer the matter to the arbitration of Sir Thomas More; but to this proposal the answer of the city was conclusive:—"By suche arbytrements in tymys past, the Comyssary and Procters, and ther officers of the University, hath usurped and dayly usurpyth upon the Towne, of div's matt's contrary to their composicions." In short, within six or seven years after the granting of the Charter, we find the University and city in open conflict. The mayor will not take the oath; the bailiffs close the doors of the Guildhall against the University, and are proceeded against and punished. Street riots, the natural expression of this mutual animosity, are of daily and nightly occurrence.

The two figures that stand out from the controversy, the Hector and Achilles of Wolsey's Oxford, are Michael Hethe, the mayor, and Edmund Shether, the proctor, excellent representatives of their parties—of sturdy burgher-like resistance, and of aristocratic and privileged aggression. Michael Hethe, brewer, of Slaying Lane, was elected Councillor in 1518, and was mayor in 1530, the year when the quarrel with the University came to a crisis; but in the interval we find his name frequently coming up as leading the disaffected party in their demands for redress. He it was that refused to take the oath; and his answers to the messengers who came to summon him before the University show that his refusal had been well considered. "Recommend me with yor master," he says on the first summons, "and shewe hym I am here in thys towne the Kyngs graceis lyvetenaunt for lacke of a better, and I knowe no cause why I shoulde appear before hym, I know hym not for my ordenary." This was flat contumacy, and the result was painful:—

> Item, on Marten Lynsey, Depute to Chaunseler of the sayd Universite, the iiij day of August, the xxij yere of your most noble raygne causyd on Michell Hethe, then beyng Mayer of the sayd towne, to be opynly denownsyd and publichyd excommunicat in every pariche churche of Oxford aforsayd; and also denownsyd and publichyd al those to be excommunicat and acursyd wheche shuld ete, drynk, or company wt the sayd Mayar, by reason wherof the sayd Mayar, avoydyng of further inconveniens, avoydyd forthe of the sayd towne.

The Mayor returned however, and though he expressly refused the conditions offered him for absolution ("quod dictus Michael expresse facere recusabat"), he seems to have won the day, and had his sentence removed. But while he and Master Edmund Shether lived in the same town there was no peace for either party. Six years afterwards we read that this terrible proctor, with a following of two hundred scholars, after running a-muck at any townsmen whom they could catch at Carfax, "came to William Fallyfields house and brake down ye pentisyes and windowes of his house and his dores, and called for fier, and said they would fier his house; and from hence they went to Michael Heathes house, one of the Aldermen of ye said towne, and beate at his dores and windowes so yt they brake yere windowes, and called for fier"—and used language that we should be sorry to print, though it was a proctor that used it. This proctor is indeed, as Mr. Turner sententiously says, "a striking figure." His great instrument for keeping order seems to have been a poleaxe; and it must be admitted that a poleaxe would be a great help to a proctor on occasion. One Robert Maydeman, a citizen, had at one time painful experience of Mr. Shether and his axe;—

> Item, Robt Maydeman deposeth yt as he and a little ladde wch is his brother were comminge from Oseney to his house ye 3de day of March last past, about ye houre of eight of ye clocke in ye night, mett with certayne schollers against St. Peters Church in Bayly, and there did beate him, and ere yt he came at Carfaxe there met him another company of schollers and there beate him, and at Carfaxe their met him another company and did beate him, and there lost his cappe, and soe ye said Robt. would have taken his house, and ye schollers yt were in ye street did put him from his dore, soe yt he was fayne to take one William Dewys house, a botcher; and within halfe an houre after ye sayd Robt. came to ye dore and would have gon to his house, and their met with Edmund Shether, ye Proctor, goinge downe ye streete with a poleaxe in his hand, and had a paire of brexen journeys on his backe, and a blacke cloake then, and a skoll on his head, and there desired him yt he might have his cappe yt he lost, and therewith ye Proctor did thrust his pole-axe at him, but saide never a word to him.

These miserable squabbles, as we have said, fill the better part of the records of the eighty years; but at the same time there is much in the volume that is interesting in quite other directions. In few books, we imagine, can we find so lifelike a picture of the details of the Dissolution as what is here said of the destruction of the Abbeys of Osney and Eynsham. The very Bill for the demolition of Osney is preserved; and we read with a strange feeling the cold-blooded entries of "xs to Popping Jaye the joiner, for taking down ye stalls and sydes of ye quire and hye altar"; of "vs vd to John Wesburne, chief carpenter, *for hangyng the great bell*"; of "xxs to John Edwards, carpenter, for taking downe of the roofe of ye fraterhowse at Abynton, in parte of his bargen." With a still stranger feeling we read the record of the paltry espionage and despicable delation by which the Royal Council got up their case against the Abbots. (See the information of John Parkyns, January 18, 15 37/8, pp. 141-4.) But it is well known that Thomas Cromwell did not stick at a trifle; all means were good enough for him. It is more important to note a little entry of the conditions on which he disposed of the site of Osney Abbey, which shows that he had views of his own as to the future of Oxford. A very curious and unique document (from the Gough MSS. in the Bodleian) gives an exact account of the leasing of Osney Abbey to a person who bore the beautiful name of William Stumpe, a Malmesbury clothier; and, after stating the precise extent of the abbey, it goes on to specify Mr. Stumpe's obligations. "He must bind hymself *to fynd worke for* 2,000 *persons* from tyme to tyme, if they may be gotten, *that will do their worke well contynually in clothemakyng*, for the succour of the Cytye of Oxenford and the coutrey abowt yt, for the which intent the mylles were made." In other words, Oxford was to become a great manufacturing town. Why the attempt failed does not appear; but it is interesting to speculate on what might have been the future of the University had it succeeded. Probably, instead of a Royalist Oxford in the seventeenth century, and a Jacobite Oxford in the eighteenth, we should have had a great Republican or Whig party within the University, or at least controlling it from close by; and who knows whether University reform might not have been antedated by a couple of centuries?

There is much else in this volume on which it would be inter-

esting to dwell; notably, the minute account of the preparations for the burning of the bishops, which includes the very bill of fare supplied to Cranmer in his last days. But these matters and the purely municipal and official records we must leave unnoticed. We may conclude by again expressing the hope that Mr. Turner may soon be ready with another volume, carrying us down to the time of the Parliament and the siege. That volume could hardly fail to be as important a contribution to the history of England as this is to the history of the University and the city.

THE GREATEST HEIRESS IN ENGLAND.*

IF Mrs. Oliphant had kept the present novel up to the point of merit with which it starts, if the second and third volumes had been equal to the first, it might rank among her best. We find in it a nature and insight, a freshness and humour, which prove her to be in the vein. She has hit on a congenial subject. She enters upon the story with interest and spirit, and with that power which a plot that suits her always develops. But it happens to other writers besides Shakspeare to quote Dr. Johnson—that what they do best they soon cease to do; and in novelists, above most others, this best often lies in or near the beginning. The careful unfolding of their story is apt to give place to the knack of writing as the work proceeds; with, however, in the present case, bright passages at intervals and returns to nature and probability.

We think it likely that an old play, to which indeed one of the characters makes vague allusion, suggested to Mrs. Oliphant the idea of the plot. We mean the play which owes such lingering ghost-like existence as alone it deserves to four words, once proverbial, but which now lives embalmed—their source probably unknown to the ordinary run of readers—in that scene in *Guy Mannering* where Counsellor Pleydell defeats Glossin's last resource by introducing in the nick of time "the real Simon Pure." The present novel and the play alike rest their interest on a will and its consequences. But while the playwright (Mrs. Centlivre) represents the will as already in operation, Mrs. Oliphant introduces us to its gradual growth under the hands of the father of the heroine, who, in the course of arranging and rearranging and adding codicils to the document, embodies in its provisions the conclusions of a naturally acute mind speculating on a society of which it knew nothing by experience. The design in both cases is to make marriage a difficulty, almost amounting to an impossibility, to the heiress whom the whimsical father leaves behind him.

John Trevor, the father of the heroine, begins life in very commonplace fashion as the master of a commercial school. He marries late a woman no longer young, who had led a hard life like himself, and who dies in a few years, leaving one child, a girl. She had lately inherited a brother's money, which turned out to be, not a humble competence, as she had supposed, but an immense fortune. It is this fortune that develops John Trevor into a sort of commercial Polonius. He is not without imagination, and "the management of a great fortune excites the mind and draws forth this faculty." He throws himself into the combinations of speculative money-makers, and acquires a sort of divination and spirit of prophecy. After many successful *coups* a new sense of cleverness steals into his heart, and it occurs to him to shape out his daughter's life for her as well as her fortune. Hence the will, which was to be a potential living instrument by which from his grave he would still be able to look after the affairs which had cost him so much trouble. From this point of view a husband had no place. John Trevor would rather, if he could have settled it for his daughter, that she should never marry. All his calculations went for her as Lucy Trevor, not as Mrs. So and So. He intended her to make a very fine use of her money, living to that end like a princess; he imagined her a sort of national institution. In this dream of what his daughter was to be he took very little count, which was natural enough, of what she, a quiet, slim girl of seventeen, actually was:—

> The manner in which she was to conduct herself in all the difficulties she might meet was the subject of his continual thoughts, until at last it seemed to the old man that he saw her, as in a mirror, moving along through the difficulties and perplexities of her life, in which his own position would enable him to accompany her with his advice, rather than that he was actually inventing the entire course of her experience for her.

And Lucy is constituted, alike by her dutifulness and her absence of imagination, to humour this dream. She is bored by the will—which it never occurs to her to dispute in any of its clauses—simply from hearing so much of it. It divests the idea of wealth of its charms; but she listens, takes for granted, and assents on all but one point. She has a little half-brother of whom her father takes small account, being, in fact, ashamed of the weakness of a second marriage, and determined that what comes through Lucy's mother shall never be devoted to the boy's use. It is the only point in the will that Lucy disputes. She will not promise that little Jock shall have no share in her prosperity, but be held down to the sphere of life in which his father was born. This child, of imagination all compact, who at seven or eight reads Shakspeare and *Don Quixote* and every book he can lay his hand on, is a pretty contrast to his sister and only friend. He strikes the reader as an idealized portrait, and drawn *con amore*. The pair are thus set before us:—

> Though he had lain as still on the rug as if there had been no quicksilver in his little veins, he could scarcely stand quietly now and have his little greatcoat put on, which his sister did with great care. She was seventeen, a staid little person, with much composure of manner, dressed in a grey walking dress trimmed with grey fur, very neat, comfortable, and sensible, but not quite becoming to Lucy, who was of that kind of fair complexion which tends towards greyness; fair hair with no colour in it, and a face more pale than rosy. Ill-natured people said of her that she was all the same colour, hair, cheeks, and eyes—which was not true, and yet so far true as to make the grey dress the least favourable envelope that could have been chosen. . . . Whoever might be found fault with for untidiness in Mrs. Stones's establishment, it never was Lucy; her collars were always spotless, her ribbons always neatly tied, her dress the very perfection of good order and completeness. She put on her brother's little coat and buttoned it to the last button though he was dancing all the time with impatience; then enveloped his throat with a warm woollen scarf and tucked in the ends. "Now your gloves, Jocky," she said, and she would not move till he had dragged these articles on, and had them buttoned in their turn. . . . "Well," Lucy added, surveying him with mingled satisfaction in the result and reluctance to allow it to be complete, "Now we may go."

It is difficult to invest such a heroine with the prestige of wealth. The design, indeed, is that Lucy should be in strong contrast with her expectations and her father's ideal; but the title of the book has to be borne out. *The Greatest Heiress in England* should have something to show for her money, if not in her own person, yet in the *éclat* that hangs about it and the reverence of the servile crowd; but we must say that Lucy never gets beyond the heiress-ship of ten, or say twenty, thousand pounds in the manners and designs of the speculators upon her fortune. The old man reckons on defeating the wolves who are to surround his poor lamb. "One wolf is not a bad thing to keep off the others"; but the wolves in this case are such a commonplace pack! They show so little sense of the prize for which they are plotting that the reader cannot set her on the pedestal which unbounded ideal wealth raises in the imagination. She stimulates no ambitions. Anybody thinks himself good enough to scheme for her, without realizing what it is that he schemes for.

In order to keep her safe, the father's last crowning device is to appoint seven guardians, without whose joint consent she is not to marry. They are all different in their positions in life, their circumstances and surroundings. The first of them is a woman of rank, the aunt of a neighbouring baronet. We observe in Mrs. Oliphant a graduated scale of care in her delineation of characters who are to fill the scene and work out her plots. Persons of rank and position are invested with individuality. Pains are bestowed upon them to keep them distinct in their aims or in their modes of carrying them out; but when we come to a lower grade, the middle class in its various aspects, she takes them in the lump, all actuated by the same impulses, all equally direct and blindly bent on following them out. It is here that the story breaks down. The father dies; his will is read; and seven persons find themselves named as having a veto on the heiress's marriage. The lady of rank has the first turn. Lucy is to spend her first six months with Lady Randolph, aunt of Sir Thomas, who is wolf number one in the father's foresight. Among the others are a schoolmistress, a lawyer, two humble relations of her mother, the rector of the parish, and the Dissenting minister to whose congregation the deceased had belonged. The last two, having neither sons nor nephews, can only supply a little sparring characteristic of their respective social standings; but the imaginations of the others are at once in a blaze to utilize this good thing for some pretender whose one chance in life is a piece of luck like this falling in his way. The schoolmistress has a nephew who does not get on. She summons him at once to her house, and throws him, without any regard to appearances, into contact with her pupil. The attorney's wife has a son, whom she is in an equal hurry to throw at the poor girl's head. He is a mere lout, with nothing to say for himself, and his hands always in his pockets, who has to be goaded to pay the heiress the commonest civilities, and whose only notion of what is to be got out of her is horses to ride and nothing to do. It never seems to occur to his mother that Lucy, after six months' living with fine people, and with the consciousness of owning a million of money, might detect these shortcomings in the youth, or have founded any ideas upon her altered position; nor to either of these schemers does it occur that each must depend ultimately for success on the consent of the other. In fact, this idea of the seven vetoes has the look of being forgotten by the author when it has furnished a scene or two, until it suits her to call it to remembrance in the wind-up. As for the humble relations who are to succeed to the charge of the heiress after her taste of polished and cultivated society, they display a vulgarity of thought as well as tone which is with Mrs. Oliphant a class distinction, a blemish inseparable from a certain station of life. As we have said, she bestows her careful writing on "society." If people are not in society, or at least have not some claim to, that privilege, she sets her pen off at a gallop, and makes them say and do anything that comes first to hand. This couple also have a candidate—a cousin who succeeded John Trevor in the mastership of the commercial school. On him the author bestows some pains, investing him with more character than the rest. Not that any one of the would-be lovers is without happy distinguishing touches characteristic of the author.

One pretender who has no interest among the seven guardians belongs to a distinct class, and brings out, no doubt, some real experience. Lucy has a clever schoolfellow better born than herself, but as poor as she is rich. Mary Russell, and the family of

* *The Greatest Heiress in England.* By Mrs. Oliphant. London: Hurst & Blackett.

which she is a member, furnish some good scenes. Here again is a brother, who enters upon the pursuit backed by his own conceit and the adoration of mother and sisters. The history of his novel and its dedication, and how the scandal of the dedication sold off the novel, shows knowledge. The heroine's simple efforts to relieve the transparent poverty of the family surroundings, the recoil from a gift, the eagerness for a loan which there is no possibility of repaying, but which relieves the recipient from the humiliation of gratitude, are all good. The mother, who had flounced off in high dudgeon at the frank offer of help in money, has come back as the new idea flashes on her :—

> All her defences were broken down. She grasped Lucy's arm and clung to it as if it had been an anchor of salvation. "And I came," she gasped, "to say, if you would really be so kind—oh! how can I ask it? as to *lend* us the money you spoke of—only to *lend* it, Miss Trevor, till something better turns up—till Bertie gets something to do . . . it can't be but that we shall be able to repay you somehow . . . the best people have to borrow sometimes, and there is nothing to be ashamed of in being poor."

The will, which had directed Lucy to be generous on a large scale, had said nothing about loans. Lucy did not know how to overcome Mrs. Russell's scruples :—

> She hesitated and faltered. "Dear Mrs. Russell, it is there for you—if you would only take it, take it altogether!" she said in a supplicating tone. "No," said her visitor firmly. "No, Lucy, do not ask me. You will only make me go away very miserable—more miserable than I was when I came. If you will *lend* it to me I shall be very glad. I don't hesitate to say that it will be a very great service—it will almost be the saving of our lives. I would offer to pay you interest, but I don't think you would like that. I told Bertie so; and he said if I were to give you an I-O-U; I don't understand it, Lucy, and you do not understand it, my dear; but he says that is the way."

When the "loan" is given it is thousands, not the poor hundred Mrs. Russell hoped for. It raises the family ideas to the point of giving out that they have had a fortune left them, which might as well have been twice as much as the bequeather had untold wealth.

Lady Randolph, who first takes the heiress in charge, has also a candidate of her own. Her nephew, Sir Thomas, or Sir Tom, as he is called, who has open manners, a cheery voice, and great good-nature, makes an impression at once, though neither the reader nor the heroine knows this. He is well done. It is a pity that the implied dissipation of his early life, and the means through which he had wasted his large fortune, are not veiled in a deeper obscurity. He owns himself a prodigal, and comes round the seven guardians in a genial fashion, making confessions not over-seriously of the follies of his previous life. Curiously enough, though he is known to be hard up, his "poor acres heavy with mortgages, stiff with borrowings," yet nobody had thought of his using his opportunities for repairing his broken fortunes. All regard the lady as indeed flying high; as though her million—for she is a millionaire—had been the paltry twenty thousand which we take to be the highest sum that the imagination of the crew of suitors had been able to master. These are considerations that will not trouble the novel reader, who takes up the book for amusement and will not quarrel with details if he finds the end answered. The heroine is a nice heroine, with points in her character as well as in her situation which will secure her a more lasting place in his memory than is the lot of many of the class; and, as for her choice, he will probably see with the author a natural affinity between heiresses and prodigals. If, as Lord Burleigh said, Rank is ancient Riches, if riches lie at the foundation of title, they are equally necessary to keep it in repair, to maintain it in a gilded and flourishing condition.

BOULGER'S CENTRAL ASIAN PORTRAITS.*

SUCCESS in taking portraits may depend on the materials for the picture almost as much as on the painter's skill. We have not to complain, in the case before us, either of any want of diligence or of lax inquiries on Mr. Boulger's part. He has devoted much time to the exploration, on paper, of Central Asia; and neither Major Burnaby nor Mr. McGahan could have exhibited more energy in evading Russian colonels and crossing inhospitable wastes than the author has shown in ransacking authentic "books of travel, histories, and official documents," in order to fill up the outlines of every sketch. But the impression left on the mind, after all, is that of deficiency of subject-matter. Recent critics have remarked on the tendency of modern Roman historians to "go beyond the evidence." They fill in details, it is urged, and supply motives for actions on the part of Cæsar or Cato as if they had before them huge diaries and lengthy correspondence, written by the principal actors and published in neat binding by the firm of the Sosii. Mr. Boulger, to do him justice, seems conscious of this weakness in his case. Of one notable character he tells us "that it is not easy to grasp the individuality of Abdul Rahman by means of the extremely meagre evidence which we possess." This refers to a Khokandian and not to the son of Afzul Khan. Of Khudayar Khan, who played a not unimportant part at Khokand, we have but a slight sketch; and in more than one-half of these short biographies there is a want of breadth, animation, and vitality. The characters live but do not move. Nor can we endorse the apparent censure passed by Mr. Boulger on the Indian Government for having thrown impediments in the way of Central Asian exploration by Englishmen, and thus diminished our chances of getting at the truth. It may doubtless be convenient that Khans and Viziers should be "interviewed" by adventurous correspondents and roving colonels, provided this can be done without danger to themselves and risk of diplomatic rupture, followed by that ominous phrase "ulterior measures." But Governments have to weigh consequences, and it is hardly to be expected that Ministers and Viceroys can permit their own officials to get into scrapes or situations of peril whence a moveable column may be required to extricate them. Opinion differs considerably amongst Anglo-Indian experts as to the value of Captain Butler's recent discoveries, and it is not worth our while to run the risk of multiplying causes of political scandal in order that the reading public may know exactly what changes have occurred in the grim features of some Asiatic tyrant since he was last seen by General Abbott on his ride to Khiva, or described by Professor Vambéry when eluding detection in the guise of a Dervish.

* *Central Asian Portraits.—The Celebrities of the Khanates and the Neighbouring States.* By Demetrius Charles Boulger, Member of the Royal Asiatic Society, Author of "England and Russia in Central Asia," "Yakoob Beg," &c. London: Allen & Co. 1880.

These sketches are seventeen in number. We have Dost Mahommed, his son, and his grandson; three Russian generals; the Akhond of Swat, well known to Anglo-Indian officials on the North-West Frontier; and divers other potentates, who, having risen to notoriety by treachery or talent, in their turn have given way to some one with more ability and fewer scruples. One of the most prominent figures in Afghanistan, and indeed in Central Asia, will always be Dost Mahommed; and Mr. Boulger tries hard to bring this Sirdar before us by the help of Sir A. Burnes and Mohun Lal, the Hindu convert to Mahomedanism. It is curious that he should make no reference to the graphic description of the Dost by Sir John Kaye, who had himself seen this Barukzye chief playing at chess with Miss Eden in the drawing-room of Government House at Calcutta. We reproduce a striking passage from the *War in Afghanistan* (vol. i. p. 105) :—

> Nature seems to have designed him for a hero of the true Afghan stamp and character. Of a graceful person, a prepossessing countenance, a bold, frank manner, he was outwardly endowed with all those gifts which most inspire confidence and attract affection; whilst undoubted courage, enterprise, activity, somewhat of the recklessness and unscrupulousness of his race, combined with a more than common measure of intelligence and sagacity, gave him a command over his fellows and a mastery over circumstances which raised him at length to the chief seat in the empire. His youth was stained with many crimes, which he lived to deplore. It is the glory of Dost Mahommed that, in the vigour of his years, he looked back with contrition upon the excesses of his early life, and lived down many of the besetting infirmities which had overshadowed the dawn of his career. . . At the zenith of his reputation there was not, perhaps in all Central Asia, a chief so remarkable for the exercise of self-discipline and self-control; but he emerged out of a cloudy morn of vice and sank into a gloomy night of folly.

In General Lumsden's *Mission to Kandahar* there is also a capital sketch of the Dost, as he appeared in his later years, in 1857. It is melancholy, even at this lapse of time, to read a grave proposal of Sir W. Macnaghten that a chief of such signal courage, ambition, and capacity should be compensated for the loss of a kingdom which he had shown himself fully capable of governing, by the grant of a zemindarry or estate in the valley of the Deyrah. As well might our envoy have expected the Alexander of Juvenal's Tenth Satire to be contented with banishment to the rocks of Gyara or to the limits of Seriphus. Had the English administrators of that day given their support to the Barukzye Sirdars, and adopted for the Dost the policy of Lord Mayo towards Shere Ali, the whole course of recent history might have been changed. But, whatever may be thought of a policy of our time which finds able partisans and opponents, there can be no doubt that Kaye hardly used too strong language in regard to Lord Auckland's course. "It was in principle and act an unrighteous usurpation, and the curse of God was on it from the first." On the whole, we prefer Mr. Boulger's portrait of the Dost to that of his son Shere Ali. In the latter case the author indents on the writings of the late Mr. J. S. Wyllie, and quotes a passage which might induce his readers to imagine that that able young civilian had seen Shere Ali in the flesh. To the best of our belief, with the exception of the time when the Dost and his young son were detained in India between 1840 and 1842, no Englishman ever set eyes on the late Wali until the Umballa Durbar. Mr. Wyllie took his materials at second-hand. Mr. Boulger further omits all mention of the late Syed Nur Mahomed, and without him no portrait of Shere Ali is complete. The Syed, who has lately been denounced as an evil counsellor and arch traitor, was, like many other Afghans, plausible and treacherous, but his ability and devotion to his master's interests admit of no question, and a description which omits even to mention the Minister cannot be said to be realistic as regards the ruler. Yakub Khan, our late choice, fares slightly better; but here we have the help of Lieutenant Marsh, who in his *Ride through Islam* describes the Governor of Herat as he saw him in 1873, when four years of close confinement had not crushed his spirit. To speculate on the exact share taken by Yakub in the recent disastrous occurrences at Cabul would be equally premature and useless. It is some satisfaction to reflect that for the last ten years, mutilations, the knife, the blinding needle, and other ready instruments of Afghan revenge have gone out of fashion. A generation ago, when a rebellious son or troublesome nephew once entered a dungeon he rarely came out of it again.

Perhaps the account of Amir Hussain Khan, better known as Shuja-ud-Doulah, pleases us the most. He is hereditary Governor

of a frontier city in the northern part of Khorassan. Of pure Persian blood, he speaks Turkish as well as his own language, possesses a smattering of English and French, is a *bon vivant*, and a successful sportsman. How he was very nearly thrust into a sack and smothered, but was saved by the intercession of a friend; how his son closed the gates of the city against him, but was attacked and expelled the district, revenging himself subsequently by carrying off a beautiful bride intended for his father, is clearly and concisely told. Like most other vigorous despots, who are impervious to European influence and example, this Governor is very free with the bastinado and the knife. Mutilation saves all expense about prison discipline, though, in reality, it merely converts thieves and robbers into helpless beggars who, in another shape, get their living out of society. We should be glad to think that the ability which appears to characterize this Governor was devoted to putting down the Turkoman raiders. But, according to Mr. Boulger, expeditions made by the latter for the purpose of carrying off slaves from Khorassan are met by Persian reprisals to carry off "loot." That the decrepid, impecunious, and helpless Government of the Shah should ever apply itself in earnest to the task of dealing effectively with robbery would indeed be a surprise to those who have studied the national character. Izzat Kutebar is another adventurer in whom Mr. Boulger endeavours to excite some interest by calling him the Rob Roy of the Steppe, or the Knight of the Steppe, and by giving us a specimen of his oratory. But, to say the truth, all the author's researches only excite a curiosity which they do not gratify. Very likely this chief routed Cossacks, slipped through the hands of Russian leaders, and effected his retreat over what is oddly designated a "sandy morass." But we do not discern evidence to justify the conclusion that he had in him the makings of a great soldier. He may have been an active freebooter with some sense of independence and a touch of patriotism. But Mr. Boulger will find it hard to support his theory that it is open to an ordinary leader of Turkomans or Kirghiz to become a Nadir Shah.

As a contrast to pretenders to empire, picturesque borderers, and governors polished in appearance but savage at heart, we have portraits of three Russian generals—Kaufmann, Kolpakoffsky, and Tchernaieff. The first of these personages is charged with vanity, extravagance, and recklessness; but we shall be slow to hold General Kaufmann mainly responsible for lack of progress and failure to develop trade. Visions of a rapidly increasing commerce in the Khanates must, in the nature of things, be disappointing. Trade will not spring up, in spite of certain spots of unrivalled fertility, amidst "sandy morasses" or deserts, and along shallow rivers in which a light flotilla of gunboats can manage to float. There is really no ground for assuming that the occupation of any one or all three of the Khanates, would have been followed by a "roaring trade" in Khiva melons, Kirghiz fat-tailed sheep, or Turkoman horses, had the title of Governor-General of Turkestan been exchanged for that of a Chief Commissioner, and had the post been filled by Sir R. Temple or Sir Bartle Frere. We, however, quite agree with Mr. Boulger that it would be absurd to compare General Kaufmann with Warren Hastings or Clive. Nor are we aware that the idea has occurred to any one. We are informed that General Kolpakoffsky, who has acted as deputy to Kaufmann and who is now officiating as Governor-General of the province of Samiretchinsk, is friendly to England. And we are quite willing to take Mr. Boulger's voucher for the purity of his private life, his military experience, and his rare administrative skill. That he speaks the native Kirghiz tongue and that he can make very long journeys on horseback is of course very gratifying; but there is many an Anglo-Indian administrator of eminence of whom much the same can be said without the least approach to exaggeration. We have been told once or twice lately that Russian officials are better calculated to govern Orientals than ourselves because of the greater similarity of the national disposition and habits. Mr. Boulger, apparently, does not share this view, for he mentions it as a distinctive feature of General Kolpakoffsky that, unlike his contemporaries, "he has always striven to understand the people whom he governs." Our own opinion is that, in spite of insular prejudices and an occasional want of sympathy, the Englishman in a pith helmet and an alpaca coat would in the end gain the greater influence over acute and sensitive Asiatics. But we do not care to pursue the comparisons which Mr. Boulger's volume unavoidably suggests. Of the third Russian officer, General Tchernaieff, it was already known to us that he captured Tashkend with only two thousand men, and that, after a successful career in Central Asia, he reappeared in Servia in the year 1876. We are now informed that he has in the interval practised without much success as a notary public; that he has not been very lucky in sundry commercial ventures; and that he has written important articles in the *Russki Mir*. He also attracted general sympathy by taking a bath in the native fashion immediately after the surrender of Tashkend, and by drinking off a bowl of tea without hesitation, when offered him by one of the crowd immediately after his ablutions. In contrast to the preceding there is the present Amir of Bokhara, Mozuffar-Uddin Khan, whom the author describes as a bigot and a tyrant, at least in his treatment of dignitaries and nobles. Mr. Boulger must excuse our saying that for a real portrait of this strict disciplinarian we do not want anything beyond M. Vambéry's graphic description at p. 187 of his *Travels in Central Asia*. That accomplished writer saw the Amir both at Bokhara and at Samarcand; and he really brings before us in a few pages the man himself, with his fine black eyes, corpulence, thin beard, affable manners, hatred of innovation, love of economy, strict sumptuary legislation, and simple fare of pilao boiled with mutton fat, the same dish satisfying "prince, official, merchant, mechanic, and peasant." In conclusion, it might be ill-natured and incorrect to assert that the present work is an illustration of Dr. Johnson's saying of a bad thing well done. We admit the workmanship to be very fair even when we lament the deficiency of the materials. But it will scarcely enhance Mr. Boulger's reputation as a well-known writer on Central Asia, nor does it add much to our means of solving those difficult questions which that vague geographical title inevitably suggests.

GOLD, SILVER, AND PRECIOUS STONES.*

IT is not long since we noticed the Blue-book issued last session on Hall-marks. We then took occasion to speak of the present decayed condition of English art in the precious metals. The publication of books on the goldsmith's work has never been more frequent than of late. Every year several volumes are issued in which the great achievements of old artists in gold and silver are duly set forth and criticized. Yet we hear only of machine-made jewelry; of racing-plate weighing so many ounces, but otherwise valueless; of caskets which blend in one half-a-dozen styles and systems of symbolism; of bridal suites of diamonds and pearls in which the number and size of the stones are the only things worth noticing; in short, everywhere, year after year, we note the same dreary monotony of aimless design and meaningless ornament, the same high estimate of what may be termed mere brute value, and the same failure to produce high art-work. We all laughed at the rich manufacturer who changed his pictures as well as his wall-paper every couple of years; but we think it quite the obvious thing to do to melt up family plate and buy new, or send the ancestral diamonds to be recut. Yet a jewel which has about it even a suspicion of Cellini, or a cup which may, however doubtfully, be assigned to Holbein, is worth, as everybody knows, five, six, seven, perhaps a hundred times, the value of the gold, silver, and precious stones used in its construction. We hope that the interest which has evidently been aroused in the public mind may lead to better things. Some of us may live to see a case or two of jewelry at Royal Academy Exhibitions. The present system of hall-marking, as we observed on a former occasion, is fatal to the possibility of true art being attached to silver-work at present. Should one of our first artists design a statuette, a cup, or a casket in a precious metal, it could not be sold without a special license, and even then not until it had been assayed at Goldsmiths' Hall. Little obstructions and delays are sufficient to cripple the progress of a manufacture in which the risks and expenses are so great. But it is humiliating to think that at a period when England has reached her highest point of material wealth, at a time when, for thirty years at least, prophets and priests, poets and essayists, have been lecturing us upon the religious, moral, social, and political importance of æsthetics, Mr. Pollen is forced to acknowledge in the volume before us that there is not much to be said of modern plate. That silver-work should have been better in the barbarous age of the Georges than in the full blaze of our Victorian civilization and æsthetic refinement is a fact which must be left to Mr. Herbert Spencer and his coadjutors for insertion in its proper place as a social phenomenon.

Mr. Pollen's larger volume consists of a catalogue of the examples of gold and silver work at the South Kensington Museum, preceded by a sketch of the history of the art, and illustrated by chromo-lithographs, etchings, and woodcuts. The sketch is published separately, and with only the woodcuts from the larger work. Mr. Pollen begins, of course, with the Book of Genesis and Abraham's wealth in silver and gold; but we have not been able to verify the assertion in his first sentence:—"It is said in the Book of Genesis that Abraham in the twentieth century B.C., when he went out of Egypt, was very rich." We do not remember a word in the Biblical narrative about "the twentieth century B.C." Archbishop Ussher dates the event about 1921, Hales about 2077; but neither finds a text to support his view. If we suppose that Abraham acquired his wealth in Egypt, it follows that gold was already in existence there; and Mr. Pollen might have begun with that country, taking the Hebrew patriarch in his proper chronological position. Many older examples of Egyptian jewelry have been found than the ornaments of Queen Aah-hotep exhibited here in 1852. Mr. Pollen's account of them is sadly misprinted; but we gather that in his opinion the Queen lived about 1500 B.C. It is very difficult to date any Egyptian monument with much certainty before 1300 B.C. and the reigns of the nineteenth dynasty. Herr Brugsch places Queen Aah-hotep about the year 1700 B.C., and even Wilkinson makes the commencement of her son's reign 1520. So that Mr. Pollen's 1500 agrees with no theory. Further on, mentioning Osirtasen I., he says he was contemporary with Joseph. This is likely enough, but is inconsistent with any system of chronology if Abraham lived "in the twentieth century B.C."; for it makes Abraham and Joseph to visit Egypt together, as all the authorities

* *Ancient and Modern Gold and Silversmith's Work in the South Kensington Museum.* By John Hungerford Pollen. London: Chapman and Hall. 1878.

Gold and Silversmith's Work. By the Same. S. K. M. Art Handbooks. London: Chapman & Hall. 1879.

History and Mystery of Precious Stones. By William Jones. London: Richard Bentley. 1880.

are for once agreed in placing Osirtasen in, or nearly in, 2000 B.C. Mr. Pollen further tells us that Moses lived under Thothmes III. —a view almost universally abandoned. When Mr. Pollen touches on Egypt and Israel he might have given a more intelligent account of the treasures of the Tabernacle, as there is not a single item for which a probably contemporary example from Egypt may not be found in our museums. This chapter is by far the weakest in the book; but Mr. Pollen *vires acquirit eundo*. The account of early Greek work is well condensed; and the chapter on Roman gold and silver, supplemented by notes in the catalogue and an admirable etching by Mr. McCarty, is almost exhaustive. As an instance of the truth that, before our own degenerate days, the value of plate was not reckoned by weight alone, we may quote the cost, recorded by Pliny, of a bowl on "which was represented Ulysses and Diomed with the palladium," which was sold for 33*ol*. per ounce. Would not a racing cup by Mr. Watts or Sir Frederick Leighton probably fetch as much? But all trades, since what may be called the modern English renascence, have been slow to learn that good work is better than gold and good design more precious than rubies.

On mediæval metal-work Mr. Pollen is naturally well informed, though we miss any reference to Iceland, and are told that Ireland is "the most distant of the European islands." He is very clear in denying that art failed under the influence of early Christianity:—

Of the new or revived art under Christianity we will treat presently; here it must be noted that Constantine built the great basilicas of St. John Lateran and the old St. Peter's in Rome, and, besides encouraging religious art, determined to build and adorn a new capital. It cannot therefore be said that Christianity killed the arts of antiquity. On the contrary, the most cursory examination of the catacombs shows that such modest ornamentation as could be placed with propriety over the altars of those sacred grottoes was carefully carried out before the conversion of the Emperor. The paintings still remaining there are rude, but it was such art as was procurable.

This is very true of more arts than one, and it may safely be doubted whether any greater or more influential work was ever executed than the great basilica of St. Sophia. The notes in the catalogue are often interesting, but it might have been expected that South Kensington would have found Mr. Pollen at least one herald capable of giving an intelligible heraldic account of the beautiful "Pembroke Casket." One shield, the most important of all, is wholly omitted in Mr. Pollen's description; which, fortunately for the reader, is supplemented by a fair etching by Mr. Harbutt. Indeed the etchings are all very fair, and show how satisfactorily a book may be illustrated with plates of this kind. One drawing, of a seventeenth-century cup, might very easily pass for a "Little Master."

Mr. Jones's book is of a very different character from Mr. Pollen's. In the first place, Mr. Jones is seldom dry; Mr. Pollen is seldom easy reading. Mr. Pollen admits such a sentence as that in which he tells us that Irish golden jewels are "principally personal ornaments for the head, neck, breast, limbs, chest, waist, &c." We have all read in *Brown, Jones, and Robinson* of the stuffed horse which was really all Wallenstein's, "except the head, neck, legs, and part of the body," which had been "restored." Where the ancient Irish wore their "personal ornaments" except upon their heads, bodies, and limbs Mr. Pollen endeavours perhaps to tell us by his "&c." Mr. Jones, on the other hand, though seldom turgid, offers us some curious points of grammatical structure. "In 1442 two parts of the 'Pusan,' the great collar of gold and rubies, *was* pawned." As we mentioned Joseph above, the following remarks of Mr. Jones on his career may be appropriate here; as appropriate, at least, as they are in p. 144 of the *History and Mystery of Precious Stones*:—"Inexorable with the Arabian princess, severe with his own brethren, proof against the blandishments of Potiphar's wife, yet susceptible of every pure and generous affection, Joseph, the saviour of Egypt, was ever consistent with himself." For the story of the Arabian princess which calls forth this burst of eloquence, as well as for the connecting link between Joseph and precious stones, we must refer to the book. It is dedicated to Mr. Ruskin, from whom one or two quotations are taken with a due amount of the adulation which the great apostle of high art seems to exact from his followers. For the rest it is made up of a series of pleasant and well-chosen anecdotes, stories, quotations, and archæological notes, arranged in so orderly a manner that, though there is no index, the reader will seldom miss it. As an example of Mr. Jones's style, and as throwing some light on recent events, we may quote the following paragraph:—

The Estrella do Sul (Star of the South) brilliant, in the possession of the Khedive of Egypt, has a curious story attached to it. It was found in 1853 at Bargagem of Idinas Gerães (Brazil), by a negress. In the rough state it weighed 254½ carats. Of the score or two of persons who made fortunes by the discovery, Casimiro (de Tal), whose negress brought it to him in order to obtain her freedom, was the only one disappointed, having sold it for 3,000*l*. At the Bank of Rio de Janeiro it was deposited for 30,000*l*. It was cut by Costar, of Amsterdam, who became its possessor, and was sold to the Khedive.

What has become of it? The bondholders should ascertain. The following will be new to many of our readers:—

The true value of jewels, as souvenirs of affection, is shown in the will of the late Earl Stanhope, in which he gives certain diamonds to his daughter-in-law Evelyn (the present Countess Stanhope), for her life, stating that, in so doing, it is in accordance with the wishes of his late wife, as expressed in a memorandum, in which she sets forth that the jewels were part value of the deceased peer's published works, and as such she was very proud of them. After the death of the Countess, the diamonds were to be made heirlooms, to pass with the title.

LOYAL AND LAWLESS.*

MR. BURKE'S book stands in some need of the introduction which is explanatory rather than apologetic. At all events he frankly warns his readers of what they may expect, and hints that, if they are to do justice to themselves or him, they must prepare themselves for somewhat serious reading. We have used the word "book" advisedly; for, though *Loyal and Lawless* contains several stories, crossing each other like the tracks in a mountain country, it scarcely satisfies the ordinary conception of a novel. Mr. Burke can be amusing and even sensational when he pleases, but on this occasion he has deliberately preferred to be instructive; and it must be admitted that he shows a certain daring originality. Political novels, dull, dreary, and clever, are by no means uncommon; and several of the latter class have made the literary reputation of an author whom Mr. Burke heartily admires. But Lord Beaconsfield and his imitators have treated their politics from the æsthetic and artistic point of view; making principles, party measures, patriotism, and political self-seeking, the essence and savour of an exciting story. It has pleased Mr. Burke to pursue a different system. He interpolates whole chapters of political dialogue and disquisition which have not even an indirect bearing on his plot. There is an advantage in this plan, no doubt, inasmuch as you may skip them should you care to do so; a course of proceeding, however, which we are far from advising. On the contrary, if any one desires to get lively lights on our administration of British India, or to coach himself up in contemporary Irish questions with the least amount of plodding and the smallest expenditure of energy, we strongly recommend Mr. Burke's political chapters to him. For Mr. Burke, though he can be earnest enough, has an Irishman's sense of humour. He illustrates his positions and arguments by happy anecdotes which in their variety and appositeness remind us of Charles Lever in the best of his later Irish novels, or in the brilliant essays he wrote in the exile of his foreign consulates under the pseudonym of Cornelius O'Dowd. He sketches after the life, with sharp and suggestive touches, the portraits of those typical Irishmen whose conduct, language, motives, and inconsistencies of character utterly mystify the innocent Saxon. And he brings in startling stories of "cuteness" and crime, with even more startling pieces of evidence from those Blue-books which are so seldom waded through by ordinary readers, in spite of their strong and realistic sensationalism, and the dramatic elements in which they abound. We have the English landowner and absentee with a great Irish rent-roll. We have the resident proprietor, heartily loyal, but who has learned in a measure, under stress of his surroundings, to conform himself to the ways of thinking of his more unscrupulous countrymen; who is morbidly alive to the blunders and inconsistencies of English administration, while honestly devoted to the English connexion. We have the big farmer and the small holder; the priest; the "patriot" and agitator; the *parvenu* who has risen to wealth by roguery, and is at the bottom of much of the mischief he professes to deplore. We have the voluble demagogue beginning life at the bar, who has been bought over by place to the side of the authorities; and who has the candour to confess the reconsideration of his opinions when he has been steadied by the responsibilities of office and the prospect of further advancement. Of course we are also made familiar with persons among the peasant class who are the instruments of wire-pullers that keep themselves in the background, and whose deeds of atrocity are regarded with a curious leniency even by those who very possibly may be their victims. Mr. Burke bears a genuinely Irish name; and there can be no question that he knows a great deal about Ireland. And we should have fancied that the Irish questions in which he is so deeply interested were large enough to furnish ample material for a couple of moderate-sized volumes. But, as it happens, he is nearly equally well informed about India, as we learned from his former novel of *Beating the Air*; and, apparently for the sake of contrasting the British treatment of Irish and of Indians, he has thought it well to invite us incidentally to a tour through Hindostan. As he is always an entertaining and intelligent companion, we have nothing to say against this, except in his own interests. Had he been a veteran in his craft, like Mr. Anthony Trollope, he would assuredly have taken more thought for the future, and been less lavish of valuable resources. As it is, we are inclined to admire the ingenuity which has covered such a breadth and variety of ground within the modest limits of his space, as we marvel at the multitude of his characters. We are perpetually being presented to new acquaintances, who, after he has casually paraded them through a couple of pages or so, are dropped out of sight, never to reappear. Sooner or later, should Mr. Burke persevere in a pursuit for which he has undoubtedly not a few of the most indispensable qualifications, he will have cause to regret the reckless expenditure of material which a prudent economy would have utilized to more advantage.

At the same time, the thread of a telling story runs conspicuously through the motley web, and an attractive hero and more attractive heroine stand prominently out in front of the crowd. Arthur Greville is one of the many men whose prospects in life are exceptionally problematical. He has many points in his favour, and a good many more against him. Holding a post in a crack Government office, he is at the same time a man of fashion and comparatively an idler. He is well born and well connected, with

* *Loyal and Lawless.* By Ulick Ralph Burke, Author of "Beating the Air," &c. Chapman & Hall, Limited. 1880.

a small independence which depends on the good will of his father, and subsequently on the caprices of an unfriendly elder brother. He has abundance of talent, with the capacity for hard work if only he should receive encouragement enough to stimulate his ambition. In these circumstances, and being the hero of a fiction, he necessarily falls in love. The lady of his affections is all that is desirable; and the sole drawback is that the match is socially unequal. Lady Cecil Brydges has an only brother, and is the only daughter of a wealthy peer. In the quiet solitudes of Lord Chippendale's country seat in Dorsetshire, Greville and the pretty Lady Cecil are thrown into close companionship. Her mother means her to make a suitable marriage; and is so profoundly persuaded of Mr. Greville's ineligibility that she pays no attention to his growing intimacy with her daughter. In many of his little social touches, by the way, Mr. Burke shows acute knowledge of the world. Greville, who is a man of sense and of honour, awakens of a sudden to the awkward realities of his situation. He has no right to steal into the affections of a girl to whom he dare not make an offer of his hand. So he nerves himself to a painful resolution, and decides to fly from temptation and Lady Cecil. But, weakly taking a final walk with her before his departure, he is betrayed of course into a passionate explanation. It is Lady Cecil's frank expressions of surprise that force on the explanation, and her frankness is very prettily depicted without doing the slightest prejudice to her modesty. The lovers part half engaged, though Greville has the grace not to bind her formally. Then in the separation comes a harrowing *contretemps, à la Lucia di Lammermoor*. Lady Chippendale stoops to intercept and suppress the lovers' letters, and each of them believes the other to be false. Lady Cecil engages herself elsewhere; and, once formally pledged to another man, with her honest nature, there seems to be no means of extrication from the dilemma, unless Greville is to be united to her as a wealthy widow. But, within the small space which he can spare to it from politics, Mr. Burke compresses the complications of a rather intricate plot. Greville, who has been left almost penniless by his dead father, turns out to be the legitimate son and rightful baronet in place of his elder brother. As the head of an ancient family, with a rental of 4,000*l.* a year, he might fairly aspire to marriage with Lady Cecil. And as it seldom rains but it pours, the way to their union has been still further smoothed for him. When Lord Chippendale had broken off his daughter's engagement to her former betrothed, on being made acquainted with a scandalous incident in that gentleman's bachelor career, he had promised that Cecil might choose freely for herself, provided her choice lighted on a gentleman. Narrow circumstances need be no obstacle, as he should undertake to provide handsomely for the housekeeping. So he dowers Cecil with an amount equal to half Sir Arthur Greville's income, and gives them his blessing and best wishes into the bargain. Moreover, to ensure their happiness, Greville has the promise of a Parliamentary future opened to him, being returned, by an unlooked for piece of good luck, as Conservative member for an Irish county; and he ought to bring to the discharge of his duties as a legislator a profound acquaintance with the feeling and wishes of his constituents, if an elaborate course of self-education could secure this.

Among the best of the minor characters is Mr. Terence Donelan, who is Greville's principal mentor in his studies of Irish affairs. Another gentleman who commends himself to our approval is Mr. Adam Crayshaw. Mr. Crayshaw, when first introduced, is far from being attractive. He is barely a gentleman by birth, and still less so by habits and education. He is of that objectionable type of Parliamentary prigs who go about the world with obtrusive self-assurance, hunting for facts and statistics like Mr. Gradgrind; and it is his peregrinations in that pursuit that land us with him in India. But Crayshaw has married in haste to repent at leisure; and when his wife, who never loved him, has eloped and died in disgrace, he comes out as an altogether altered character. He becomes the staunch friend of Sir Arthur Greville, who has had occasion to do him some delicate kindnesses; and he welcomes the opportunities of showing his gratitude when his nature has been ennobled by his sorrows and humiliations. We should have been glad to have seen something more of Miss Marian Trelawney, who becomes Crayshaw's second wife; as of Miss Trelawney's father, who is surnamed Don Whiskerandos. But it is the misfortune of Mr. Burke's cursory and too comprehensive method of treatment that he does imperfect justice to himself as well as to some of his cleverest creations; and we hope that, when he makes his next appearance as a novelist, he may be induced to narrow his immediate range, remembering that he should keep something in reserve for his future.

THE RACEHORSE IN TRAINING.*

THE author of this book has had great experience in the subject of which he treats. For thirty years he has managed a large racing stud, and his stables afford room for fifty horses. Many very celebrated racehorses were trained by him; and he has had ample opportunities of observing the peculiarities of horses, as well as the characteristics, agreeable and otherwise, of the British Turf. Having taken up his pen in order to write about the subjects with which he is best acquainted, he uses it very creditably. The book is readable; and, when the author has said all he has to say, he stops, without padding his volume unnecessarily. It is something to find a book on sporting subjects free from Latin or Greek quotations; but Mr. Day is not guiltless of cribbing from English authors. He quotes Shakspeare, Byron, Butler, and finally Dr. Johnson; but only within moderate limits—for a sporting writer. He makes a daring dash into grand language in his second chapter. Writing on manure, he describes it as being "in a high state of fermentation, disengaging deleterious gases—for the sole purpose of producing excessive heat, poisoning the circumambient air that beneficent nature has provided." Having, however, relieved himself of this wordy firework over the dung-heap, he seems to have thrown his dictionary on one side, and to have descended to language "understanded of the people."

The first matter dealt with is the stable. The author's own stable consists of nineteen boxes and thirty-one stalls. He considers flint pavement preferable to brick, the latter being slippery and less durable. Drains he dislikes. As a substitute he would have every stable completely cleaned out every day and left to air while the horses are at exercise. For food, he gives his horses the best English oats and the finest hay he can procure. Beans and peas he seldom uses. As alteratives he now and then gives a small quantity of green food in summer and carrots in winter. For water, he prefers rain water collected in large tanks. Failing that, he would use pond water; or, last of all, he would use well-water softened with either wheat-flour or chalk. His stable hours begin at 5 A.M. in winter and at 4 in summer. He is no advocate for over-exercising, about a couple of hours in the morning and an hour or an hour and a half in the afternoon being all that he expects of his horses in hard training. He expresses a strong opinion against the use of bandages when horses are in health, and he recommends plenty of hand-rubbing in order to dry the legs and assist circulation. In treating of roaring he says he is told that at the Cape of Good Hope this disease is unknown, and that the worst roarers, when taken there, become sound. With regard to condition he thinks that no definite rules can be laid down, and that no one but the trainer, who is well aware of the temperament and idiosyncrasies of any particular horse, can be any judge whether he is fit to run. Some horses run better when carrying a good deal of flesh, and others when drawn very fine; but, generally speaking, Mr. W. Day likes his horses to be very light when they are to start for a race. He says that the outward appearance of a horse is often very deceptive, in proof of which he gives the following anecdote. A colt, which he had trained until he thought he was, if anything, too light, broke his thigh, and had to be destroyed. A *post-mortem* examination was then made, when, instead of being, as was expected, almost a scarecrow, he was found, to the astonishment of all concerned, to be a mass of fat. This was, of course, clear evidence that the colt was not properly prepared; and yet, from his external appearance, any trainer would have felt inclined to ease him in his work and endeavour to get him a little bigger. Contrary to the conventional opinion of racing men, Mr. Day considers a glossy coat to be no criterion whatever of a horse's condition. That a horse should look sleek in his coat is generally considered one of the very first symptoms of health, whether in a carriage-horse, a hunter, or a racehorse; but Mr. Day thinks otherwise, and in the sixth chapter of his book he enters at some length into the question. Writing about condition leads the author to make a few remarks upon the opinions of his patrons thereon, and he enlarges on the difficulty of pleasing employers on this point. He tells a story about some horses which belonged to two racing confederates. These animals he was training for their engagements at a certain meeting, a short time before which he received visits on different days from each of their joint owners. One of these gentlemen was extremely dissatisfied, and he complained that the horses were "as fat as bacon hogs." When his colleague arrived a day or two later he was even more displeased. In his opinion the horses were much too light and overtrained, and he described them as being "as dry as chips." When the races took place neither of the owners would back the horses, although for diametrically opposite reasons. Yet the horses won. We may here observe that the moral of most of the anecdotes in this instructive volume amounts to this—that owners who implicitly trust and act upon the advice of Mr. William Day are always rewarded with success, while those who take the opposite course are equally certain to be confounded. In our author's opinion one of the best tests of fitness is a horse's behaviour after a gallop. If his nostrils are then very little distended, and if his flanks are not heaving, he is probably sufficiently prepared for racing. Sweating, of which many trainers think so much, Mr. William Day considers no criterion of a horse's condition, as many horses sweat very freely even when completely prepared. His favourite tests, however, are trials, and he uses them almost as often as a criterion of condition as of quality. Contrary to the doctrine generally thought the most orthodox, he distrusts public form, and places great reliance in private trials. He candidly allows that the results of several trials of the same horses are often very contradictory; but, where there can be any doubt, he would try and try again until thoroughly satisfied as to the merits of the horses. In a trial, as in a race, especially when the distance is short, a very trifling misadventure, such as a horse crossing his legs at the start, may make the result untrustworthy. The author thinks that a common cause of the mistakes made in private trials is that, the jockeys being ordered not to hurry their horses until they are well settled into their strides,

* *The Racehorse in Training; with Hints on Racing and Racing Reforms.* By William Day. London: Chapman & Hall, Limited. 1880.

some distance is often traversed before they are going at racing pace, and, consequently the actual length of the trial-course is materially shortened. He is in favour of trying yearlings. Many people object to trying horses until they are two years old, and even some trainers who try yearlings never make the trial course longer than three furlongs; but Mr. William Day tries them over half a mile, and discards such yearlings as then appear worthless. The results of trials are sometimes contradicted in racing through the fault of the jockey, in proof of which the following stories are given:—

There are instances again when defeat of highly-tried horses may be accounted for; as, for example, when Nimrod beat Fisherman and Marionette at Stockbridge in 1859. The owner of Fisherman gave me 25*l.* and paid Nimrod's stake (10*l.*) to make running for him. This the rider of Marionette also knew, and Fisherman and Marionette waited together so far behind that they never could get up and were easily defeated, both being about two stone better than the horse that was enabled to beat them through the circumstances described. A singular case of this sort took place not many years ago on the same spot, when odds of fifty to one were actually laid on a horse which waited such a long way behind his stable companion, a mare, that he could never catch her, and so was defeated by a head.

The bugbear of many good judges of horses is bad hocks, but Mr. Day thinks that "the worst-looking hocks, with spavins and curbs, often stand the test of work, whilst the perfectly-shaped ones will give way with little or no warning, and never get right again, treat them as you will." In fact, he would "not much object to a spavin or a curb," although nothing would induce him to buy a horse with a thorough pin, as he has "never known one so affected to stand a thorough preparation." While admitting that a good big horse is probably better than a good little one, he expresses a partiality for small horses, and he is no doubt right in believing them to be more easily procurable. Small horses he believes to be at their best when two years old, while larger horses do not ripen until much later. He also lays stress on the point that big horses are the most likely to become roarers. He prefers yearlings from private breeding farms to those which are sold at large commercial establishments, at which he thinks there is far too much "stall-feeding" for selling purposes. Giving immense sums for yearlings he thinks a foolish system, and he finds that he can get good ones for from one hundred to three hundred guineas. Once he purchased a yearling for ten guineas which afterwards won many races, including the Great Eastern Handicap and the Shrewsbury Cup. He complains bitterly of the yearlings too often sent to trainers, saying that they frequently are without a single quality to recommend them except lumps of fat, and that their owners grumble when they turn out to be worthless.

Jockeys will not feel flattered by the opinion expressed of them in this book. They are described as being "for the most part precocious lads who neither know their own business nor will submit to be taught it by those who do." The light-weight pigmies are "generally left at the post, or get badly off, and ride their horses to a standstill before half the distance has been gone over in the vain hope of regaining their lost ground. After the race" they will have "the audacity, with smiling face, to tell you" that they were the "first away to a very good start," or, at any rate, they "will never admit being further from the first horse than a length or two." The only remedy which the writer can suggest is to get rid of the necessity of baby jockeys by raising the scale of weights, so as to enable more experienced lads, or even men, to ride. He would like to raise the standard of weights as much as 21 lbs., and he states that the late John Scott agreed with him on this point. He objects strongly to the practice of giving large presents to jockeys when they have ridden the winner of a great race; but he makes no protest against magnificent presents being made to the trainers of successful horses. Indeed he complains of the irregularity with which trainers' accounts are settled. He tells us that some owners "pay yearly, some in a number of years, some not at all." Many employers pay in bills of exchange, which, when the trainer requires ready money, have to be discounted by money-lenders at fifty per cent., and perhaps renewed on maturity at the same terms. He states that the late "John Scott had at one time over 20,000*l.* on his books owing to him, over and above his yearly bills." On the other hand he admits that munificent presents, and even bequests, are made to trainers, by some employers, while there are owners who will even advance large sums to their trainers when they are short of capital. He tells us that the late Mr. Boyce, the trainer, "was, at the death of his employer, not only left his string of racehorses, but the house, stables, and the whole of the household furniture, even to the linen, plate, and pictures." Another employer, who did not owe his trainer a farthing, sent him 8,000*l.* on account.

To our mind, the most objectionable part of this book is that which preaches the pernicious doctrine that by keeping racehorses and betting "it is possible with a limited income to gain a fortune," "if not in the first, then in subsequent years." We are not prepared to affirm that such a thing is mathematically impossible, but upon its excessive improbability we think it needless to enlarge. What is said about betting will be considered perfectly fair by betting-men, but the following anecdotes of the proceedings of trainers and their commissioners may surprise weak-minded non-betting people:—

In another instance in 1859, some time before the Two Thousand, I asked my commissioner to back *Promised Land* for me. But he declared this could not be done. "No one will lay," he averred, "except at a very short and unfair price." "Very well," I replied, "I shall not run him." It is almost absurd to add that this had the desired effect. "How much do you want to back him for, and what price will you take?" came the rejoinder in the shape of a question. I named the amount and my price, and in the course of the same day was informed by my worthy commissioner, "Rather than you shall not be on, Mr. Day, I will lay you the money myself." A similar thing occurred with the same horse and the same person for the Goodwood Cup. The horse was first favourite before a shilling of my commission was executed. But I changed the face of things by informing this worthy on the night before the race: "I shall not run the horse here in this case; I shall keep him for the St. Leger." And again it was found my money could be speedily put on for me at my own price.

* * * *

One other more recent instance in respect to the Goodwood Stakes must suffice. Our commissioner at the time was requested to back a horse for that race for 1,000*l.* immediately after the publication of the weights. Between this period and the declaration of the minor forfeits there was a great deal of betting, our horse standing at 50 to 1. On the latter declaration, he rose to 33 to 1, at which price he stood some time, and then advanced to 20 to 1, when the commissioner said that most of the money was on. But when asked for his account, he replied that the returns from the country had not yet been received, and that he would send it in so soon as these came to hand. But the so-called returns were, as might have been expected, delayed, and before their arrival the horse had reached the short price of 7 to 1. Then he enclosed the account, saying: "With great regret I have to inform you that my country agent has spoiled the whole thing. He has missed the long shots and has been compelled to take the shortest price, which only has since been obtainable; and the unfortunate result is a considerable reduction of the average, which now stands at 12 to 1."

* * * *

The horse won, and what was the result? Instead of receiving the 25,000*l.* which we were fairly entitled to, we received only 12,000*l.*, or a little less than half.

In reading the chapter on betting, we are left with the impression that the author considers the greatest evil of racing to be the forestalling of owners in the betting market. He dwells in a later chapter upon the disagreeable concomitants of racecourses in the shape of singers of indecent songs, whom he describes as trolling forth offensive doggerel. He believes that, "once freed from obnoxious elements"—*i.e.* the trollers of offensive doggerel, and not the gentlemen who refuse to run their horses unless they can obtain what they consider sufficiently long prices against them—the turf "would receive a sudden access of visitors, who now avoid it." Who these visitors would be, we are informed in the next sentence. "Clergymen of many denominations are deterred from attending races, not because they disapprove the sport in itself, but because of the Saturnalia into which, unchecked by any authority, the scene is turned." Surely the millennium would be reached when the Archbishop of Canterbury and "the dear Dissenting brother" should stand side by side watching the Derby through their binoculars. Mr. William Day, however, does not wish to see music banished from the racecourse, provided it be decent and improving music. "Melody," he tells us, "adds to such diversion a pleasure of its own; songs that would delight and not offend the senses, would be an acquisition to such a scene, whilst instrumental music would help to beguile that period which, in the intervals of racing, might become, by comparison, wearisome; and those who should contribute such accessions, deserve both encouragement and reward."

When we have added that Mr. William Day never exercises horses on a Sunday, and that there is a good index at the end of his book, we think we have said all we have to say about *The Race-Horse in Training*.

MINOR NOTICES.

THE Masque (1), the reprint of which Mr. Law has edited, was "presented upon Sunday night being the eight of Jan^y 1604 in the Greate Hall at Hampton Court and personated by the Queene's most excellent Majestie, attended by eleven Ladies of Honour." Mr. Law's interesting introduction begins with a sketch of the Court, early in the course of which he notes that the Queen "in her way southward from Scotland had been received at Althorp in a most elaborate and exquisitely beautiful pageant designed by Ben Jonson." For the masque of the Twelve Goddesses Queen Elizabeth's wardrobes were sacked, a proceeding which Mr. Law says "is of a piece with all James's acts," and Mr. Law thinks it probable that the machinery and scenery of the show were devised by Inigo Jones. Of the masque itself a clear and consecutive account is compiled, and there are interesting extracts from a letter of Dudley Carleton's to John Chamberlain, dated January 15, 1604, which has never before been printed. "Theyr heads," Carleton writes in one passage, "by theyr dressing did onely distinguish the difference of y^e goddesses they did represent. Onely Pallas had a trick by herself, for her clothes were not so much below the knee but that we might see a woman had both feete and legs which I never knew before. She had a paire of buskins sett with rich stones, a helmet full of jewells, and her whole attire embosed with jewells of seueral fashions." It is curious to find a record of the early existence of literary piracy in the fact that a spurious edition of the masque was produced without the author's permission or name, which not unnaturally "seems to have given some offence to Daniel and the Court." Daniel described it as "the Vnmannerly presumption of an indiscrete printer who without warrant hath divulged the late shewe at Court, and the same very disorderly set forth." There are three copies extant of the spurious edition, and only

(1) *The Vision of the Twelve Goddesses; a Royall Masque.* By Samuel Daniel. Reprinted and Edited, with Introduction and Notes, by Ernest Law. London: Bernard Quaritch.

two, so far as Mr. Law can ascertain, of the authentic version which was produced by Daniel to correct the errors of the printed one. Mr. Law is enthusiastic, perhaps too enthusiastic, over the merits of masques in general; but both the reprint itself and his introduction to and comments upon it have much interest.

The handsome testimonial edition of Mr. Planché's Extravaganzas (2) will be a valuable addition to dramatic libraries. Mr. Planché's career as a dramatic author was begun in 1818 with *Amoroso King of Little Britain*, which was produced successfully at Drury Lane, but which its author, who, in spite of its success, describes it as a "crude attempt at dramatic writing," has prevailed on his editors to exclude from the present collection. The first play in the edition is *Success; or, a Hit if You Like It*, which was modelled on the plan of a French *Revue*, and was produced with an excellent cast at the Adelphi in 1825. The piece is cleverly and brightly constructed, and, like most of those in the collection, has in its allusions and the notes which explain them considerable value in connexion with stage history. This is followed by *Olympic Revels*, the first piece of that class which Mr. Planché may be said to have invented. Before the production of this play, Mr. Planché tells us, it had been the practice "to dress a burlesque in the most *outré* and ridiculous fashion. My suggestion to try the effect of persons picturesquely attired, speaking absurd doggerel, fortunately took the fancy of the fair lessee (Mme. Vestris), and the alteration was highly appreciated by the public; but many old actors could never get over their early impressions. Liston thought to the last that Prometheus, instead of wearing the Phrygian cap, tunic, and trousers, should have been dressed like a great lubberly boy, in a red jacket and nankeens, with a pinafore all besmeared with lollipops." The fanciful and delicately humorous style of piece of which Mr. Planché is the acknowledged master has unfortunately almost disappeared, to make way for what is in most cases mis-called burlesque; but we heartily endorse an editorial note on Mr. Planché's prefatory words to *King Christmas*, the last play in the collection. The author writes, "of this, my last extravaganza," and the editors add in a foot-note "Query, *latest*, as we sincerely trust that *King Christmas* may not be Mr. Planché's 'last extravaganza.'" We need only add that we can take up any of the five volumes of this handsome and welcome edition with the certainty of lighting upon something entertaining or interesting.

The family history of the Gilpins (3), written by the Rev. William Gilpin, the author of *Forest Scenery* and of sundry *Picturesque Tours*, covers a period of nearly two hundred years, from the birth of Dr. Richard Gilpin, in 1625, to the death of the writer of the memoirs, in 1804. The earliest member of the group, Dr. Richard Gilpin, was rector of Greystoke, in Cumberland. His life was uneventful. His eldest son, William Gilpin, was Recorder of Carlisle; and, as legal adviser and agent for Sir James Lowther, then the richest and most influential man in Cumberland, he had much to do with the development of the town and port of Whitehaven. John Bernard Gilpin, the youngest son of William, was an officer in the army, and was in Carlisle Castle as commandant of a company of invalids at the time of the entry of the Pretender in 1745. The biographies of these three persons, with an autobiography of the author, the Rev. William Gilpin, Vicar of Boldre, in Hampshire, and some brief notices of other members of the Gilpin family, make up the volume. It is a wearisome record of a series of commonplace lives, of no interest whatever to the general public, and with only the most meagre claim to local attention in the county to which the family belonged. The book has been produced at the expense of the Cumberland and Westmoreland Antiquarian and Archæological Society. It is grievous to see a Society which has done some useful, though modest, work in the past, wasting its not too abundant funds upon a publication so dreary and worthless as the Gilpin Memoirs.

The twenty-second number of the new *Tales from Blackwood* (4) contains a curiously touching story by Charles Lever, called "Some One Pays," and a tale, "Left-handed Elsa," which we should be disposed to commend but for its unlucky resemblance to a story in *Phantastes*.

Mr. Dickens's new Dictionary (5) is justly described on its cover as "an easy guide for travellers." The plan of the work is simple and effective. Some thirty-five important towns on the Continent have been chosen as centres of travel, and from them the routes to the most frequented places are given, the average of those places being forty to each centre. To take the illustration given in the preface, "From the centre of *Munich* we have the routes Frankfort-Munich and Munich-Verona; the centre of *Naples* shows Naples-Verona; by continuing these three we have Frankfort-Verona, Frankfort-Naples, or Naples-Munich." The time occupied in following the routes from the centres to the radial towns is given; and, when one country is left for another, the hours of arrival and departure are given according to the railway time of the respective countries, while the actual time occupied can be seen from a table which shows the variations of railway time for the whole of the Continent. Alternative routes are shown together, and arrangements have been made to obtain the earliest information as to any change in the services. The directions and counsels given to travellers at the beginning of the book are excellent.

Mr. MacColla's sketch of the history and law of actions for breach of promise of marriage (6) has considerable interest. It is not a little curious that this should be the first work on the subject. Mr. MacColla gives no definite opinion himself as to the desirableness of the law remaining or not as it is, but states the arguments on both sides fairly. Legal readers will possibly wish that he had not attempted to enliven his subject; but, on the other hand, laymen may possibly be glad that he has done so.

There is something decidedly attractive in Mr. Anderson's small volume concerning his travels (7), which, to judge from his descriptions, he must have found, on the whole, more curious than pleasant. He gives but a poor account of the Persian character, as to which he writes, with a pleasing touch of unconscious irony, "their great faults are in the want of honesty, truthfulness, and other similar virtues; these they are totally unacquainted with, and a falsehood is considered in Persia more a virtue than a crime." Later on Mr. Anderson gives a plain and succinct account of some of the abominable barbarities and cruelties practised by the Shah, and then exclaims, with not unnatural indignation, "And this is he whose society was courted by some of the most fashionable circles of European nobility!" At Shiraz Mr. Anderson found a welcome contrast to most of his experiences in the hospitality of the European residents, a hospitality which, he says, is too often trespassed upon by "loafing, dissimulating Italians and Germans, who frequently pass through Persia on foot *en route* for India." This is an odd passage, and seems to require annotation. Mr. Anderson's *Wanderings in Persia* include an account of his experiences on his return journey in Russia, of which country he seems to have formed no better opinion than he did of Persia; and certainly his bitter expressions with regard to certain parts of the Russian system are warranted by the scenes and facts which he describes.

Mr. Parker Gillmore says that the main contents of the volume (8) he has lately produced were so well received by the public some years ago that he has "presumed to hope this corrected and improved edition may obtain fresh favours from critics as well as general readers." The book is full of stirring tales, one of the oddest and most exciting of which will be found under the heading, "A Battle in a Billiard-Room." One passage, relating to the author's slaying of an alligator is curious as showing how the love of animals may co-exist with the love of chasing and killing them. "Towards the majority of animals I have a strong feeling of kindness, amounting to love. . . . In killing most species of game I have always felt a qualm at depriving a helpless animal of life, but on this occasion I turned from my handiwork well satisfied with my performance."

Mr. Bicknell in his "sermonettes" (9) has wisely avoided any attempt at fine writing, and has aimed merely at placing what he has to say in as simple, interesting, and easy a form as he can command.

Bibliophiles will welcome Mr. Stock's facsimile reproduction of the autograph MS. of the *De Imitatione Christi* (10), which has had to encounter a curious series of misadventures before it saw the light, caused first by the difficulties of photographing and the breakage of negatives, then by the destruction by fire of some of the electro blocks, and then by various accidents which befel the Dutch paper. The final result, however, is completely satisfactory.

The fresh appearance of any important edition of *Don Quixote* (11) is an event of great interest to literature. One hundred and sixty-eight years ago Motteux's translation obtained some well-deserved favour, for it supplanted the infamous caricature which John Philips made of the ever chivalrous and pure-minded knight some five-and-twenty years before. But Motteux allowed his own version to retain too much of the impurity of the one that he corrected, and his first edition, which appeared in 1712, was disfigured by the plates that were originally prepared for the folio of Philips. If these had been the only things stolen from Philips by Motteux, there would have been less to complain of in the revival of a translation that is not suitable to our own day or adapted to our tastes. It is not unlikely that Lord Woodhouslee is responsible for

(2) *Testimonial Edition of the Extravaganzas of J. R. Planché, Esq. (Somerset Herald)* 1825-1871. Edited by T. F. Dillon Croker and Stephen Tucker (Rouge Croix.) London: Samuel French.

(3) *Memoirs of Dr. Richard Gilpin, and of his Posterity in the Two Succeeding Generations. Written in the year* 1791. By the Rev. William Gilpin. Edited by W. Jackson, F.S.A. London: B. Quaritch. Carlisle: Thurnam & Sons. 1879.

(4) *Tales from Blackwood.* New Series. No. XXII. Edinburgh and London: Blackwood.

(5) *Dickens's Dictionary of Continental Railways, Steamboats, Diligences, &c.* Published Monthly. No. 1. March 1880. London: Charles Dickens.

(6) *Breach of Promise; its History and Social Considerations: to which are added a few Pages on the Law of Breach of Promise and a Glance at many Amusing Cases since the Reign of Queen Elizabeth.* By Charles J. MacColla. London: Pickering.

(7) *My Wanderings in Persia.* By T. S. Anderson With Illustrations and Map, showing the Scientific Frontier in Afghanistan and the Russian Advance in Central Asia. London: James Blackwood & Co.

(8) *Adventures in Many Lands.* By Parker Gillmore, "Ubique." With Illustrations by Sidney P. Hall. London: Marcus Ward & Co.

(9) *Sunday Snowdrops: Lay Sermons.* More especially for the Use of Young Boys. By Walter L. Bicknell. London: Masters & Co.

(10) *The Imitation of Christ; being the Autograph Manuscript of Thomas à Kempis' "De Imitatione Christi."* Reproduced in Facsimile from the Original preserved in the Royal Library at Brussels. With an Introduction by Charles Ruelens, Keeper of the Department of Manuscripts, Royal Library, Brussels. London: Elliot Stock.

(11) *The History of the Ingenious Gentleman Don Quixote of La Mancha.* Translated from the Spanish by P. A. Motteux. Vol. I. Edinburgh: Paterson.

the rash encomiums which have been given to this work, and which the present publisher reproduces; but even he complains of "the licentiousness, abbreviations, and enlargements," which required to be corrected, and probably, but for his dislike of Smollett, we should never have heard of any praise of Peter Motteux from his lordship. The most singular thing, however, remains to be said of this translation. It is not the work of Motteux. The title-page of the third edition informs us that it is "translated from the original Spanish by several hands," and is published by Peter Motteux. What Lord Woodhouslee properly calls his "presumptuous mutilations" of the original make us regret that a work already dead should have been by artificial means made to bear the semblance of life. For some time it had been the common belief that Motteux's translation was made not from the original Spanish, but from French; and Jarvis, who appears to have always been unfortunate in his accusations, says that it "is a kind of loose paraphrase rather than a translation, and is taken wholly from the French." This was repeated by Sir Joseph Collyer in his *Dictionary of the World*, from which it was borrowed by Navarette. It is, however, not true. Bad as some of the French versions are, there is none to equal it in that respect to be found in the French tongue.

Messrs. Paul and Co. have published a beautiful edition (12), bound in vellum, of Shelley's minor poems, with an excellent preface by Mr. Garnett.

A handsome and convenient library edition of Mr. Stubbs's well-known and most valuable work, *The Constitutional History of England* (13), has just been issued from the Clarendon Press. It is needless to say that the printing and getting-up of the book are excellent.

We note, with every hope of its success, the enterprising publication at Rome of a magazine written in English (14), and dealing with subjects of wide and general interest. The first number contains, amongst other things, articles on "English Parties and Foreign Politics," on the French drama, on Renaissance literature, and on the revival of antique jewelry.

In the October number of the *Melbourne Review* (15) two articles—on Balzac and on Lessing's *Nathan der Weise*—have special literary interest. Whether Mr. Blanbaum, who writes the second of these articles, is right in thinking that a translation of *Nathan* would find favour on the stage, is perhaps open to question.

The December number of the *Victorian Review* (16) has many articles of interest, among them one by Mr. Edward Dicey on agricultural distress in England; and it follows the model of the *Revue des Deux Mondes* in having a *feuilleton* of fiction, the present one being Mr. Francillon's clever story, "A Bad Bargain," which, in construction, is as ingenious as one of Gaboriau's stories.

We have received the sixth issue of the *Victorian Year-Book* (17), in which several fresh tables have been introduced, while the figures have been corrected to the latest date.

A third edition, revised and enlarged, has appeared of Mr. Thackeray's well-known *Anthologia Latina* (18).

This is the 167th year of publication of Debrett (19), and the present edition contains valuable additions to what seemed before a singularly complete work. Amongst these additions is copious information, the collection of which must have cost considerable pains, as to "particulars of the professional services and residences of collateral branches."

A third edition has just appeared of Mr. Stephen Hawtrey's Introduction to Euclid (20), and will be welcome to the many people who remember Mr. Hawtrey's skill in making the rough ways of Euclid seem smooth to his pupils.

(12) *Poems selected from Percy Bysshe Shelley*. With Preface by Richard Garnett. London: C. Kegan Paul & Co.

(13) *The Constitutional History of England*. By William Stubbs, D.D. Library Edition. Oxford: Clarendon Press. London: Macmillan & Co.

(14) *Minerva*. A Monthly Review. Edited by Pericles Tzikos. Rome: "Minerva" Office. London: Williams & Norgate.

(15) *The Melbourne Review*. Melbourne, Sydney, Adelaide, and Brisbane: Robertson.

(16) *The Victorian Review*. Melbourne: "Victorian Review" Publishing Company. London: Macmillan.

(17) *Victorian Year-Book*, 1878-9. (Sixth Year of Issue.) By Henry Heylyn Hayter, Government Statist of Victoria. Melbourne: John Ferres. London: George Robertson.

(18) *Anthologia Latina*. Selected and arranged by the Rev. St. John Thackeray, M.A., Assistant Master at Eton College. Third Edition. London: Bell & Sons.

(19) *Debrett's Peerage, Baronetage, Knightage, and Titles of Courtesy*. Edited by Robert H. Mair, LL.D. London: Dean & Son. 1880.

(20) *An Introduction to the Elements of Euclid*. By the Rev. Stephen Hawtrey, M.A. Third Edition. London: Longmans.

ADVERTISEMENTS.

GROVE TESTIMONIAL FUND.—On the occasion of Mr. GEORGE GROVE'S retirement from the Board of the Crystal Palace Company, it is proposed to offer him a public recognition of the value of the services which he has rendered to music in connexion with the Saturday Concerts. It is thought that the same opportunity may not unfitly be taken advantage of to testify to the value of his labours in behalf of Biblical History and Geography in connexion with the Palestine Exploration Fund and the Dictionary of the Bible.

With this object it is proposed to raise a Fund by Subscription, and to employ the proceeds as may hereafter be determined by the Committee.

Subscriptions are invited, and should be paid in to the "Grove Testimonial Fund," at the London and County Bank, Hanover Square, as soon as possible.

MATRICULATION EXAMINATION.—UNIVERSITY of LONDON. Instruction in all the subjects of the above Examination is given at GUY'S HOSPITAL. The CLASSES for the June Examination will commence on Tuesday, March 30. The Classes are not confined to Students of the Hospital. For further particulars address the DEAN, Guy's Hospital, S.E.

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Eight £40; Four £20. Election, third Tuesday in May.—Apply to the SECRETARY, The College, Cheltenham.

CLIFTON COLLEGE.—CLASSICAL, MATHEMATICAL, and NATURAL SCIENCE SCHOLARSHIPS.—NINE or more open to COMPETITION at Midsummer 1880, value from £25 to £50 a year, which may be increased from a Special Fund to £90 a year in cases of Scholars who require it. Further particulars from the HEAD-MASTER or SECRETARY, the College, Clifton.

HIGHGATE SCHOOL.—EIGHT SCHOLARSHIPS, viz.: Three Entrance Foundation Scholarships of £21 a year (which may be increased to £50 for Boarders), open only to Boys not already in the School.

Three Foundation Scholarships of £21 for Boys in the School.

Two Gladstone Scholarships of £25 for Boarders only, open to Boys, whether already in the School or not. Age under Fifteen. Examination, third week in May. For further particulars apply to the Rev. the HEAD-MASTER, School House, Highgate, N.

MALVERN COLLEGE.

The NEXT TERM will begin on Monday, May 3.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea).—J. WILLIAM WILLIAMSON, M.A., Oxford, receives a limited number of BACKWARD and DELICATE BOYS, to Prepare for the Public Schools or for general Education.—Full particulars and prospectus on application.

ARMY, SANDHURST, WOOLWICH, MILITIA COMPETITIVE, UNIVERSITIES.—Messrs. ASKIN will be happy to forward (gratis) Prospectuses of successful TUTORS. References kindly allowed to Chaplain-General to the Forces and others.—Address, 9 Sackville Street, W.

THE Rev. F. D. THOMSON, late Fellow of St. John's College, Cambridge, can receive, after Easter, Three Boys under Twelve years of age, as Resident PUPILS. Address, Brinkley Rectory, near Newmarket.

EDUCATION.—Rev. W. TUCKWELL, late Head-Master of Taunton College School, and Fellow of New College, Oxford, takes a few Boys as PUPILS.—Address, Stockton Rectory, near Rugby.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B. (Mathematical Honours), late Tutor in Nobleman's family, receives PUPILS for Woolwich, Sandhurst, and Line, *via* Militia. Able staff of Masters. Individual attention and careful moral supervision. Very successful at late Examinations. Large house and pleasure grounds.—Address, Beau Séjour.

KING ALFRED'S SCHOOL, WANTAGE, Berks.—An Ancient Foundation. Buildings spacious and modern, in a healthy district. Thorough EDUCATION for the SONS of GENTLEMEN. Fees moderate. Boys prepared for Commerce, the Professions, and the Universities.—Address, HEAD-MASTER.

THE GRANGE SCHOOL, EWELL, Surrey.—Charterhouse; FIRST SCHOLARSHIP, 1879.—Resident English and Foreign Masters; liberal diet; healthy site; moderate terms. *Principal*—C. D. ALEXANDER, M.A., Cambridge.

CAREFUL PREPARATION for the PUBLIC SCHOOLS.—SANDROYD HOUSE, near Esher, Surrey.—Rev. L. H. WELLESLEY-WESLEY, assisted by Rev. F. B. FIRMAN, M.A. (late Senior Classical Assistant-Master at Elstree School), and E. T. ALLEN, B.A. Oxon. Terms, £80 to £110. Number of Boys, twenty.

EDUCATION, BELGIUM.—For Army, Navy, Civil Service, and Public Schools. Thorough French and German. Head-Masters, a Foreign Graduate and English Public Schoolman. Every home comfort. Terms £60 to £80.—Address, W. L., 32A George Street, Hanover Square, W.

A TRAINED TEACHER desires HEAD-MASTERSHIP or Appointment in some Public Institution. Ten years in High-class Schools and College. Mathematics, Science, French, Latin.—Address, E. HOLNESS, S. George's School, Ascot, Staines.

MALVERN COLLEGE.—The HEAD-MASTERSHIP of this College will become Vacant on July 30 next, and the College Council will Elect a HEAD-MASTER in the course of next May, to begin his duties on September 14.

Candidates must be Graduates of Oxford, Cambridge, or Dublin University, and in Priest's Orders at the time of Election, or within three months after the appointment. The Head-Master's house contains accommodation for Seventy Boarders.

Testimonials will be received at Malvern by the SECRETARY of the College, not later than April 21; and he will in the meantime supply any further information that may be desired.

LITERARY.—A LADY wishes to procure TRANSLATION WORK from the GERMAN, from a Publisher.—Address, R. S. C., 15 Ebury Street, Grosvenor Gardens, S.W.

PICCADILLY, close to Devonshire House.—A noble MANSION TO BE LET, for the Season or a Term, well and fully FURNISHED. It comprises Five Reception and Seventeen Bedrooms, exclusive of Dressing-rooms, &c. Also excellent Stabling for Eight Horses, and Five Carriages. May be viewed by cards only, to be obtained of Mr. E. HADLEY (late Annoot & Co.), 16 Old Bond Street, W.

TO the MEMBERS of the SENATE of the UNIVERSITY of CAMBRIDGE.

GENTLEMEN,—The announcement made by the Chancellor of the Exchequer yesterday evening will lead almost immediately to the Dissolution of the present Parliament.

Under other circumstances I might possibly have wished to withdraw myself into private life, but as the works of the University Commission are incomplete, I own I feel so intensely interested in the results of their labours that I should still desire, with your leave, to be in the place I have so long occupied as your representative, in case any questions should arise about them.

To other topics I need hardly refer. The great principle of Conservative Progress, which I have ever advocated, is as true and just and important now as it ever was in any part of my Parliamentary career; and, to my mind, the wise application of that principle to all our Institutions, whether they are Political, Academical, or Religious, are, under Heaven, the real secret and the primary cause of our national well-being.

It is with these convictions that I venture to solicit once more a renewal of your confidence, not unmindful of the kindly, cordial, and generous support which I have received at your hands for not less than four-and-twenty years.

I am, Gentlemen, with great respect, yours most faithfully,

S. H. WALPOLE.

109 Eaton Square, London, March 9, 1880.

TO the MEMBERS of the SENATE of the UNIVERSITY of CAMBRIDGE.

GENTLEMEN,—Twelve years' service as your Representative in three Parliaments emboldens me to seek the renewal of a trust which is the highest honour to which a man engaged in public affairs can look.

My course in the next Parliament, if you do me the honour to re-elect me, will be consistent with the steady but independent support which I have given to the present Government.

The interests of our beloved University at this critical period will be to me a first care, as well as those of learning in general, while it will be an object of my anxious solicitude that the Church of England should suffer no detriment either as a Divine Institution or as an Estate of the Realm.

I have the honour to remain, Gentlemen, your faithful and obedient Servant,

A. J. B. BERESFORD HOPE.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

BENJN. BULL, *Manager.*

No. 1,273, Vol. 49. March 20, 1880. [Registered for Transmission abroad.] Price 6d.

MR. GLADSTONE IN MIDLOTHIAN.

AFTER preliminary gallops at Marylebone and at four or five railway stations, Mr. GLADSTONE has settled down to his work in Midlothian. He is with good reason exempt from the fear of tiring himself out by any amount of supererogatory work. He began his speech at the Edinburgh Music Hall with the statement that on his former visit he had endeavoured in some degree to open the case which was to be submitted to the constituency at the general election. To the world at large it might have appeared that he then exhausted every subject which could affect the decision of the electors; but careful readers had remarked, not without solicitude, that in one of his returning railway speeches he expressed regret at the necessity which had compelled him to omit several material topics. Notwithstanding the implied promise of his exordium, in his later Edinburgh speech he said nothing new. The customary eloquence showed no tendency to flag, though, if it were allowable to offer advice to so great an orator, Mr. GLADSTONE might perhaps be reminded that, by the use of incessant superlatives, he adds as little to impressiveness as a man who stands on tiptoe adds to his apparent stature. It is a symptom, not of force, but of excitement, to lay extraordinary emphasis on statements which are sometimes not even true. Mr. GLADSTONE asserts that in newspapers opposed to his policy "violent passions, "outrageous hatred, and sordid greed for office are described "as the motives by which his conduct is governed." Of violent language, and of hatred of some of his opponents, Mr. GLADSTONE cannot be held guiltless; but no respectable writer has ever accused him of sordid greed of office. An exclusive and intolerant conviction of the justice of his own opinions may be naturally and properly associated with a desire of the power which would enable him to give effect to his policy. Of a selfish regard to his own personal advantage he cannot be acquitted, only because he has not been accused. In one part of his speech he complains, with a whimsical and transient sensitiveness, that the Ministers, instead of standing on the defensive, have infringed constitutional precedent by attacking the Opposition. After exposure during three or four years to incessant vituperation, Lord BEACONSFIELD could scarcely be expected to admit that his assailants were themselves faultless. If it is wrong to break international and municipal law, to tarnish and deface the good name of England, and heedlessly to aggravate the distress of the country by useless and mischievous measures, it cannot be right to impute these offences to a Government without sufficient foundation. Lord BEACONSFIELD, in claiming the confidence of the country, which, as he believes, approves his conduct, is entitled to express a doubt whether his irreconcilable opponents would not, by reversing his measures, compromise the safety and honour of England. Neither Mr. GLADSTONE's accusation nor Lord BEACONSFIELD's counter-charge decides the controversy; but both are agreed that the issue is of vital importance.

Only the charm which Mr. GLADSTONE's eloquence exercises on a Scotch audience can render tolerable the recapitulation of statments and arguments which every reader of newspapers has long since known by heart. It is not unamusing to study Mr. GLADSTONE's criticisms on the Peace party, while at the same time he admits that an error, arising from the mixed nature of humanity, is 'not only a respectable but a noble error." He is anxious to deny his own participation in the error, however noble and by dint of frequent repetition he has persuaded himself that on one occasion he also took a daring course. The treaties made in 1870 with France and Prussia, to the effect that either of the two Powers would join with England in the contingency of an attack on Belgium by the other, were perhaps not extraordinarily brilliant specimens of diplomacy, though, as Mr. GLADSTONE characteristically boasts, the preparations to give effect to the treaties only cost two millions. Either Prussia or France would have been only too glad of an English alliance, if the other party had meddled with Belgium. Both Powers had, shortly before the war, discussed the annexation of Belgium to France without the smallest regard to the objections of England. After the rupture, the danger had become remote, if not imaginary. The protest against an attack on Belgium which never took place cost two millions; and, as Mr. GLADSTONE says, the protest against the Russian designs on Turkey cost six millions at first and additional sums afterwards; and it proved but partially effective. Unfortunately diplomatic resistance to the designs of a great Power bent upon war costs more and produces less result than a harmless flourish when there is no real danger. Mr. GLADSTONE quotes Lord BEACONSFIELD's expression of opinion that the Russian attack upon Turkey might have been prevented by determined opposition. It by no means follows that Lord BEACONSFIELD was inconsistent in not acting on his own judgment, with Lord DERBY in his Cabinet and with Mr. GLADSTONE exciting the people against the Government and Russia against Turkey. A statesman is only bound to do what is possible. The inevitable consequence of the neutrality of England was the defeat of Turkey, with which the Ministers are now unjustly taunted. It is true that there was vacillation, amounting, according to Mr. GLADSTONE, to ineptitude, while Lord DERBY was determined that force should not in any contingency be employed. The hesitation of England may probably have been a chief cause "of that deplorable "and ruinous war." The Ministers "did not counsel "Turkey's submission to superior force; they neither would "advise her to submit, nor would they assist her to resist." It may be added in their excuse that they gave the Porte full warning that no English aid would be forthcoming in the event of war.

The most absurd idea which Mr. GLADSTONE can conceive, though he has often discerned equal absurdity in opinions adverse to his own, is that "the presence of certain British "ironclads in the Sea of Marmora prevented the victorious "Russian armies from entering Constantinople." Facts are never absurd, because they could not have happened if they had been inconsistent with the condition of things. It is certain that the presence of the British ironclads, by its political effect, if not by material force, produced the result which, in Mr. GLADSTONE's judgment, is utterly absurd. "The first bitter disappointment was prepared "for Russia, now intoxicated with the prospect of certain "triumph, by the appearance of the British fleet in the "Bosphorus, and by the impression produced by this "event at the headquarters of the Grand Duke NICHOLAS. "'The impossible had come to pass.' The army remained, "as if rooted to the spot, outside the gates of that city "which since the days of IGOR and OLEG had never seen "the face of a Muscovite invader. For months the "Russian soldiers looked wistfully at the Mosque of St.

"Sophia, and dared not reach out their hands to "reach the Jerusalem of Slav orthodoxy, and take pos- "session of the inheritance of the COMNENI. In the "eyes of the Government the fear of intervention "'from the despised West' outweighed the appre- "hension of wounding the popular spirit and ne- "glecting the sacred traditions of the past. AKSAKOFF "and his friends raged furiously, but in vain. They were "forced to confess that the cause of Western civilization "was not yet defunct, and that the name of England had "still some meaning in the world." Such is the language used by the author of *Russia Before and After the War*, himself a Russian subject. Mr. GLADSTONE failed to explain to the assembly which laughed at his denunciation of the most absurd of ideas why the Russian army halted outside Constantinople.

It was an anti-climax in the latter part of the speech to expatiate on the supposed misdeeds of the Tory party in other times, when there was no BEACONSFIELD to mislead them. Mr. GLADSTONE might well have left to Mr. BRIGHT the office of denouncing the great French war, which, after the rise of NAPOLEON, became the most righteous and glorious of all enterprises recorded in English history. As Mr. GLADSTONE significantly remarked, the war added six hundred and fifty millions to the National Debt. That it saved the independence of England and restored the freedom of Europe are secondary considerations for an orator who, notwithstanding his heroic outlay of two millions in 1870, is perhaps not far from sharing in the "noble error" of the peace party. It was, if possible, still more irrelevant to complain of the two hundred millions of debt which were incurred during the American war. Mr. GLADSTONE declared, in a peroration of unusual eloquence, that he has laboured to maintain the noble inheritance which has descended to us in his youth, in his manhood, and till his hairs were grey. During five-and-twenty years he laboured as one of the Tories whom he now holds up to contempt and indignation. He had a perfect right in later years to change his convictions; but he must know from his own experience that the opinions to which he is now opposed are consistent with conscientious patriotism. It is a defect in his intellect or his temperament that he can never recognize the existence of two sides to a question. His adversaries appear to him always to maintain, under the influence of the worst motives, the most absurd ideas which may be applicable to the immediate subject of controversy. Only a belief in his own ineffable superiority can account for such an outburst as the first speech by which he delayed the departure of the Great Northern train from King's Cross station. He may prove to have been justified in his prophecy that he would win the contest for Midlothian, though it is usually wise to postpone boasts of victory to the time when the harness is taken off. In any other statesman it would have seemed strangely arrogant to announce to a casual crowd that he was also about to eject from seats which they unworthily occupy many other members who he hoped would attempt in retirement to acquire the Parliamentary qualifications in which they are at present deficient. It is good to be superior to the rest of mankind; but, as Lord GRANVILLE lately told Lord BEACONSFIELD, it is not wise to assert even an undisputed ascendency. As he proceeded on his journey Mr. GLADSTONE subsided into ordinary pugnacity. At York, where the train had lost fifty minutes, he took occasion to excite the jealousy of the farmers against the landlords, on the ground that the increased probate duties will fall upon stock and not on the freehold. He took care not to add that farmers' stock will divide the burden with all other personalty, and that the anomaly or inequality attaches to the whole probate duty, which has existed during his own long administration of the finances. It was injudicious of Sir S. NORTHCOTE to furnish with fresh pretexts for hostility an adversary who needed no supplement to his inexhaustible controversial resources. Mr. GLADSTONE's speeches on Thursday at Corstorphine and Ratho were, as usual, powerful, and more than usually temperate in tone, if not in substance. His frequent demonstrations of the incompatibility of the Anglo-Turkish Convention with the public law of Europe have always been weakened by the fact that Europe has never complained. His own policy of coercing Turkey in 1876 may have been morally justifiable, but it would have been a startling innovation in international jurisprudence. It is satisfactory to observe that, in speaking at Ratho on domestic affairs, Mr. GLADSTONE abstained from repeating the revolutionary proposition that, if peasant proprietorship was economically expedient, the land ought to be compulsorily taken for the purpose from its present owners.

LORD HARTINGTON AT ACCRINGTON.

ELECTION speeches of the modern pattern are lik epic poems divided into cantos or books. The candidate has to go to so many places and to speak to so many people, and, when he is standing for such a constituency as North-East Lancashire and holds so important a position in the county as Lord HARTINGTON holds, his speeches are reported so fully, that he is obliged to portion out what he has to say, and to deliver his sentiments by instalments. Lord HARTINGTON gave his hearers at Accrington the first canto of his electioneering epic. There are many other cantos to come, and in this initiatory portion he only introduced himself and his opponents on the scene, and laid the foundation for the main action of his epic. It is true that in electioneering addresses there is often to be observed a failing in the proposed progress of the author, and his hearers or readers find that in some strange way they are always being brought back to the first canto. Lord HARTINGTON may not be able to find new matter enough to fill up the other cantos which he promised the electors. Still it is proverbially harder to make a good beginning than to write any other part of a poem, except perhaps the finish, and Lord HARTINGTON in beginning well got through the most difficult portion of his task. He discussed the possible motives of the Government for dissolving Parliament at a length which would have been disproportionate if his speech was to be taken by itself, and not as one of many speeches making a whole. But if there must be a beginning of the epic, it is perhaps a natural beginning for the candidate to tell how it happens that he is where and when he is. Lord HARTINGTON has been washed by a sudden storm on the friendly shore of Lancashire, and, after the usage of epic heroes, he tells how spiteful were the gods who broke up his ship, and yet how thankful he is that he has been carried where he finds a kindly welcome, winning manners, and perhaps a new love. Looked at from any other than the epical point of view, a discussion on the reasons for dissolving Parliament is far from interesting. It does not seem to concern any one why the Government did what every one is very glad that it did. Lord HARTINGTON gave many excellent reasons for supposing that the Government did not think of dissolving when the Session opened. To dissolve seems to have been a happy thought that suddenly struck it. Even a Conservative Government must be allowed to have happy thoughts sometimes. The Ministry likes the dissolution, the Opposition likes it, the country likes it, the existing Parliament longs to end, those who hope to be returned to a new Parliament long to begin. Provided the thought of dissolving was a good one, what can it matter to any one whether it got into the brain of the Ministry all at once or bit by bit? As between contending parties, this sudden dissolution was eminently fair. The Conservatives were no better prepared for it than the Liberals. It was made after the Liberals had had a good opportunity of dissociating themselves from Home Rule, and before the Conservatives could show any special danger menacing Europe against which England had to guard. The Government had to disclose its financial plans and to offer to its adversaries the advantage of proving them to be unsatisfactory. The sorrows of the dying farmer are really a handsome present to the Opposition. The Water Bill had just lived long enough to arouse the indignation of ratepayers, and not long enough to receive any justification before a Committee of which it may be susceptible. Lord BEACONSFIELD at any rate offered his opponents a perfectly fair field of contest, and, to crown his kindnesses, he composed and published his wonderful manifesto.

To Lord HARTINGTON this manifesto was a godsend. It permitted him to treat the subjects discussed in it in the manner most favourable to his cause, and the obvious criticisms which he bestowed on it occupied all but the opening of his introductory speech. It

is difficult to conceive how these criticisms could have been better put. Lord HARTINGTON in this part of his speech was eminently clear, logical, vigorous, and yet moderate in tone and sparing of idle abuse. The decided line he has taken during this Session against the obstructives gave countenance to the renewed statement of his determined opposition to Home Rule, and Lord BEACONSFIELD's mysterious reference to the Colonies gave an easy opportunity for inferring that what was an absurd imputation in one case must necessarily be absurd in another. Lord HARTINGTON has had plenty of time to think over his letter to Lord RAMSAY, and he now explains that he regarded Lord RAMSAY as a promising lad who certainly made some rash concessions to win the Home Rule vote, but who was on the whole such a nice young man that he deserved a gentle pat on the back. If Lord HARTINGTON had written two months ago what he says now he might have saved himself from much misinterpretation. It is quite evident that Lord HARTINGTON would not now write as he wrote then. He would be much more guarded, and would tell the rash boy a little more explicitly what he thought of him. There is not the least real ground for saying or thinking that Liberals like Lord HARTINGTON are inclined to give in to the demand for Home Rule, nor are much more advanced Liberals in England inclined to waver on this point in their support of Lord HARTINGTON. The rejection by the Conservative party of the Irish Election Bill gave all Liberals equally the advantage of being able to say that their answer to Home Rule was to treat Irishmen as on an equality with Englishmen, so that they seem to have a policy towards Ireland more conciliatory than that of mere negation. On the other hand, the acrimonious language of Lord BEACONSFIELD's address has secured for the Liberal party in England the Irish vote without any inconvenient pledges being asked for. So far the Liberals meet English electors on favourable terms as regards Ireland. But nothing that Lord HARTINGTON or any other Liberal can do or say can diminish the force of one obvious consideration. A Conservative Government can exist without the support of the Home Rulers, and a Liberal Government cannot. It might happen that the Home Rulers would for a time support a Liberal Ministry rather than let the Conservatives in again, although the Liberal Ministry did nothing to please them. But it is the prospect of a Government dependent on Home Rule support, even if this support were given gratis, that frightens many Englishmen, and makes them think it better that the firmness of Lord HARTINGTON in resisting the pressure of his inconvenient supporters should not be put just at present to the test.

Lord HARTINGTON in foreign policy belongs to the old school of Whigs. His school is the school of Lord PALMERSTON and Lord RUSSELL. He knows that England must fulfil every engagement, prudent or imprudent, into which she has entered. He is well aware that England cannot remain indifferent to European affairs, and that the influence of England must depend on her power to act as well as on her good intentions. Lord DERBY, as was announced at Accrington, has given in his definite adhesion to the Liberal party, and in Lancashire it must be some advantage to Lord HARTINGTON that he has the open support of a person like Lord DERBY, who has held high office, and is of great local importance. It is something, too, for a Liberal to say that the foreign policy of the Government has alienated its own Foreign Secretary. But Lord HARTINGTON's views of foreign policy are not really those of Lord DERBY. A disciple of Lord PALMERSTON is not likely to admire endless pausing, hesitation, and uncertainty, although he may in a general way agree in a dislike of rash enterprise and hazardous undertakings. The only point perhaps on which Lord DERBY more closely approaches the traditional Whig policy than that of those with whom he lately acted is a sympathy with what are called nationalities and a distrust of the Porte. Both Lord HARTINGTON and Lord DERBY would equally disclaim any desire that England should try to dictate to Europe, and have an equal dislike of a race for ascendency. Lord DERBY, too, did one thing during his tenure of power of which Liberals strongly approve, when he aided Russia to the best of his power in defeating the German project of a war to crush France in 1875. But Lord HARTINGTON, in the midst of his criticisms of the Ministry, always takes care to make it clear that England must be prompt and decided whenever she takes any part, and Lord DERBY is not quite the man to carry out such a policy. The trouble for Lord HARTINGTON here, again, is that he finds it easier to inspire confidence in himself than in those with whom he must act if in power. On the other hand, if it is to be his fate to remain out of office, it is a gain, not only to his party, but to the country, that he should personally win general confidence and give something like coherence and dignity to the Opposition.

PRINCE ORLOFF AND THE FRENCH GOVERNMENT.

THE French Government has had an awkward business to manage in the demand for the extradition of HARTMANN. The Advanced Left, on whose support M. DE FREYCINET's Administration rests, has no particular love for the Nihilists, but it cherishes a kind of official sympathy for revolutionists everywhere. Probably, if it had been asked to say positively whether it wished a man who had attempted to murder the Emperor of RUSSIA to find sanctuary in France, it would have proclaimed its readiness to surrender him; but it would be exceedingly unwilling to admit that any such person was in France at any given time. Considering that, if the HARTMANN lately in custody in Paris was really the HARTMANN implicated in the Moscow conspiracy, he was not very likely to return to Russia, and that his absence from the country was not a matter to cause the authorities any regret, it would have been wiser if the Russian Government had never asserted the identity of the two men, or founded thereon any demand for extradition. They must have been very well aware that M. DE FREYCINET would not give up the alleged criminal unless very strong evidence both of his identity and of his complicity was laid before him, and they must also have been aware that the proofs they had to offer were not of a very conclusive kind. Documentary evidence of identity can rarely be very satisfactory, and it does not appear from the precise and detailed account furnished by the Paris Correspondent of the *Times* that any other evidence was brought forward. The Russian Government furnished in the first instance a photograph and a description; but the PUBLIC PROSECUTOR reported, after an examination of the prisoner, that he was not particularly like the photograph, and did not very well answer to the description. Before M. DE FREYCINET had received this report, Prince ORLOFF, according to the *Times*' Correspondent, had indicated a means of escape for the French Government, supposing them to be in difficulties. If you have to refuse our demand, the PRINCE had in effect said, refuse it on strictly judicial grounds. Do not tell us that the Left are so much in love with murder, when the victim is a crowned head, that they will not hear of HARTMANN being given up; but say that the French law requires such and such proofs of identity, or what not, and that this indispensable minimum has not been furnished to you. Accordingly, M. DE FREYCINET, at his next interview with the PRINCE, dwelt much on the necessity of having better proofs than any that had yet been brought forward, and was told that M. MORAVIEFF, the Russian Advocate-General, was on his way with additional evidence. When M. MORAVIEFF reached Paris it turned out that he had no fresh evidence to offer. All he could do was to explain why Russian procedure did not admit of any fresh evidence being offered. Accordingly, when the Cabinet met and were informed by the KEEPER of the SEALS, the PROCUREUR of the Republic, and the PROCUREUR-GENERAL of the Paris Court of Appeal that neither the identity of HARTMANN nor his complicity in the attempt to destroy the Imperial train had been proved by the documents already supplied, and heard from the PRIME MINISTER that no further documents were forthcoming, they had no choice but to set HARTMANN free. This decision was communicated to Prince ORLOFF in a private note from M. DE FREYCINET, in which it was expressly stated that he would be informed of the Ministerial resolution in an official letter. Unluckily Prince ORLOFF seems to have disregarded this intimation, and to have treated M. DE FREYCINET's note as official. At all events he sent it on to his Government, by whom it was taken as official, and, viewed in this light, it was discovered to contain two very grievous aggravations of the original offence. The first was that M. DE FREYCINET said that the decision of the Cabinet had been unanimous, thus implying that the Russian demand

had found no advocates among the Ministers, and had, in fact, been treated as utterly inadmissible. The second was that M. DE FREYCINET had expressed the indignation of the Cabinet at the horrible outrage to which His Majesty the CZAR had been exposed, thus referring to the august object of these outrages in too familiar and informal a manner. The arrival two days later of the formal notification did not mend matters. Prince ORLOFF has been recalled to St. Petersburg, General CHANZY is expected at Paris, and apparently the two countries may for some time to come have to carry on such negotiations as are necessary through a Chargé d'Affaires.

There seems no reason to suppose that M. DE FREYCINET could possibly have done otherwise than he did. The extradition of criminals whose acts may be variously regarded as political or non-political is always a very delicate matter. The general disposition of Continental lawyers is to regard the murder of sovereigns as a political crime in virtue of the dignity of the person against whom the attempt is directed; but in extradition treaties between France and other countries the term "political" has been interpreted so as to exclude the murder or attempted murder of the Chief of the State. With Russia, however, France has no extradition treaty; and it is easy to see how variously this absence of a treaty would be taken according as the persons concerned in the argument did or did not wish HARTMANN to be given up. In the one case it would be maintained that the French Government had given their own definition of a political crime in the treaties they had repeatedly made with foreign countries, and that by this definition they would be bound, even though they happened not to have communicated it to the Russian Government. In the other case it would be urged that the general definition of a political crime must be held to remain in force except in cases where it had been modified by a specific treaty, for, it must be presumed, specific considerations. No such treaty had been made with Russia, and an attempt on the life of the Russian sovereign must therefore still be regarded as a political crime. If HARTMANN had been given up, the question would certainly have been raised in the Chamber of Deputies, and the debate that must have arisen, besides being exceedingly embarrassing to the Government, might have been very injurious to the maintenance of friendly relations with Russia. It is at least possible that the Chamber might have interfered in time to stop the Executive from surrendering their prisoner, and if extradition had after all been refused as the result of a Ministerial defeat, matters would have been in a very much worse position than they are at present. The happy absence of adequate proof of HARTMANN's guilt, made the more telling perhaps by M. DE FREYCINET and M. CAZOT's convenient inability to satisfy themselves that the proofs actually furnished were adequate, has certainly got the French Government out of a dilemma without, so far as yet appears, any real breach of diplomatic propriety.

It is true no doubt that M. DE FREYCINET's Government will have to pay the costs of his escape. There will be a coolness probably between France and Russia until such time as the interest of the latter in being on good terms with the French Government shall get the better of the irritation which at present leads her to regard M. GRÉVY and his Ministers as so many protectors of assassins. But this coolness will be very far from being an unmixed evil for France. The friendship of Russia has of late perhaps been rather an embarrassment than an advantage. There are overtures which cannot be rejected without risk, or accepted without still greater risk; and if a temporary estrangement relieves France from all immediate chance of these overtures being repeated, M. DE FREYCINET may not have cause to regret HARTMANN's brief sojourn in Paris. There seems now to be a disposition to throw the blame of the misunderstanding on Prince ORLOFF. Whether to do so be just or unjust, it is plain that, if the Russian Government has already repented of its demand, the Ambassador through whom it was presented will make a very convenient scapegoat.

THE BUDGET DEBATE.

THE last financial debate of the Session and the Parliament was conducted under singular conditions. At one time the SPEAKER was the solitary hearer of Sir G. BALFOUR's eloquence. The CHANCELLOR of the EXCHEQUER and Mr. GLADSTONE himself could only command a limited audience. The great majority of members had dispersed to attend to their own interests in the impending elections; and the few who remained were more or less consciously engaged in the same occupation. Mr. GLADSTONE warned Sir S. NORTHCOTE that in the next fortnight he would hear more of the alteration of the Probate duties, and there is not the smallest reason to doubt that the promise will be amply fulfilled. From the same quarter the Ministers will hear many other assertions and arguments, and none that will be in any way pleasant. If the House had been at leisure to consider the question of Probate on its merits, some of the criticisms made by various members would have deserved attention. The CHANCELLOR of the EXCHEQUER could only have excused the imperfections of the measure on the ground that he also was pressed for time. It is, as Mr. GLADSTONE said, monstrous that the representatives of the deceased should be required to pay full duty on assets, without allowance for debts which may in some cases be of equal amount. The arrangement was not less monstrous during the many years of Mr. GLADSTONE's financial administration. The sole motive for the change in the duties proposed in connexion with the present Budget was that the CHANCELLOR of the EXCHEQUER required 700,000*l.*, and would be glad of a larger sum, which he may probably receive. A correction of the anomaly which was justly denounced would both have taken time and have involved a considerable sacrifice of revenue. With still better reason the CHANCELLOR of the EXCHEQUER abstained from dealing with the fiscal distinction between personal and real property. It would have been impossible to deal with so complicated a matter on the eve of a dissolution. The imposition of Probate duty on land, and the equalization of the Legacy and Succession duties, would promote a result which a popular school of economists holds to be desirable, by compelling many heirs and devisees to sell their estates.

The establishment of uniformity between Probate and Administration duties was not urgently necessary, although it is perhaps defensible. Mr. DODSON indeed contended that the existing practice had the advantage of inducing owners of property to make wills, instead of trusting to the law of distribution; but in most cases the division of assets under the statute is reasonable and just, and it is not the business of financiers to inculcate by penalties or exemptions rules of virtue and prudence. Sir STAFFORD NORTHCOTE's object was not the production of symmetry, but the increase of the whole produce of the tax. Equality might have been not less effectually and more satisfactorily accomplished by lowering the duties on intestate estates instead of raising the Probate duties. Great and just objection was made to the capricious scale of taxation, and to the sudden jumps of percentage when the property reaches certain amounts. The technical excuse that an *ad valorem* duty could not be levied because it would require a large stock of stamps was scarcely worthy of Sir S. NORTHCOTE's good sense and candour. It is far more easy to charge a fixed percentage on property liable to probate than on incomes, which are nevertheless all equally taxed. The new scale of duties will be in some respects less anomalous than the old; but the total charge on personal property will be increased by the exact amount which is added to the revenue. As the greater part of the accumulated deficits is to be covered by the diversion of the Sinking Fund and the expected surpluses of the next five years, it would perhaps have been better to dispense with any additional taxation. The increase of the Probate duties is only less objectionable than another penny of Income-tax, or than an increase of some existing duty which would have deranged special trades. By complying to a limited extent with the remonstrances and demands of his opponents, the CHANCELLOR of the EXCHEQUER will not modify a single paragraph in Mr. GLADSTONE's indignant speeches, or blunt the point of one of Sir W. HARCOURT's epigrams.

The discussion on the Probate duty naturally widened into a debate not so much on the Budget as on the financial policy of the Government during the last six years. Of the Budget itself, the additional Probate duty, which was a concession to the clamour of the Opposition, was the most objectionable part. According to hostile critics, the whole floating debt which has been incurred during three years ought to have been paid off by means of new taxes imposed at a time when they would have been most inconvenient and oppressive. Such a policy would

have [illegible] the double merit of conforming to an arbitrary doctrine, and of rendering the Government as unpopular as possible on the eve of the election. Mr. GLADSTONE has always been consistent in the opinion that the costs even of war ought to be paid out of the revenue of the year. His admirers have lately often quoted an opinion expressed by Prince ALBERT at the beginning of the Crimean war, that "GLADSTONE's proposal is wise and "courageous." At that time the PRINCE could have known little of finance; and he had not observed that Mr. GLADSTONE frequently hinted, as a reason for his policy, that heavy taxation would disgust the community with the war which he was nominally and grudgingly promoting. There are indeed sometimes strong financial reasons for contributing out of revenue to extraordinary expenditure. After several years of war PITT deeply regretted that he had borrowed lavishly, instead of meeting the costs as far as possible out of revenue; but his reason was that he had expected to finish the struggle in two or three campaigns. A costly diplomatic crisis which is now at an end requires no sudden and extraordinary exertion. Notwithstanding all the strong language which has been used for the last eight months, and which will be repeated again and again in the next fortnight, it was more prudent to spread the burden over five years than to make an enormous temporary addition to the burdens of the country.

It was hardly worth Mr. CHILDERS's while to discuss once more in detail Sir STAFFORD NORTHCOTE's six or seven Budgets. It is true that a larger sum has been spent than in the previous six years, and that a smaller amount has been received; but neither Mr. CHILDERS nor any other competent critic either charges the Government with extravagance or holds it responsible for the depression of trade and the consequent decline of the revenue. When Mr. GLADSTONE in his autumn Midlothian speeches undertook to expose the prodigality of the Ministers, he could only think of a statement, which he afterwards partially retracted, that an office of 2,000*l.* had been improperly created for the benefit of a partisan. It was a more expensive proceeding to call out the reserves, to bring the Indian troops to Malta, and to prepare for a war which at one time seemed imminent; but the large expenditure for these purposes, incurred with the approval of a respectable section of the Liberal party, raises an issue not of finance but of political expediency. The leaders of the Opposition contend that all the measures of the Government were inexpedient, and that some of them were illegal. On the other hand, the Ministers allege, with at least equal plausibility, that the display of readiness for war had the intended effect of preserving peace. If they were wrong, their error was not financial. A man who goes to the expense of underpinning his house may possibly have been unnecessarily alarmed as to the insecurity of his foundations; but it would be absurd to accuse him of extravagance. It is not surprising that the Opposition should triumph over the suspension of the Sinking Fund. Mr. GLADSTONE and Mr. LOWE from the first objected to Sir S. NORTHCOTE's plan for reducing the National Debt, on the ground that the annual payment appropriated to the purpose would be always liable to diversion. The more complicated and more expensive system of Terminable Annuities has the advantage, as its advocates remark, of being automatic. It is to be regretted that the CHANCELLOR of the EXCHEQUER consented to the suspension which he seemed to be inclined to explain away. It is generally thought that his estimates of revenue for the next year are unduly low, and it may be hoped that a considerable surplus will be applicable to the reduction of the floating debt. On the whole, he may be content to have had no more formidable attack to meet in the House of Commons. His chief opponent has reserved himself for a provincial audience before which he cannot be answered.

ITALY.

ENGLAND, the august mother of Parliaments, has lately had the satisfaction of seeing that her youngest daughter already knows how to follow with almost startling fidelity in her venerable footsteps. Italy has been having a grand debate on foreign affairs, and the Italian debate has been an exact copy of the debates on foreign affairs to which our recent Parliamentary history has accustomed us. The debate has been very long, even longer if possible than an English debate. It has been furious and impassioned. It has been full of personalities. The past, even the remote past, has been ransacked in order to furnish materials for stinging retorts and damning accusations. And yet, after all, there is nothing like a clear difference of opinion between those who attack and those who defend. Uphold the dignity of Italy, is the cry of the Right. We are upholding it, replies the Left. Strive for peace, say the critics. We are striving for it, say the occupants of power. Be friendly with all, but specially allied with none, is the advice given to the Government. What with you is advice is with us practice, is the Ministerial retort. To abuse the Ministry for everything it does or does not do is the simple strategy of the Opposition, and the maxim is carried out with an earnestness that leaves little to be desired according to the English standard. Italy must not allow herself to be effaced, is the standing cry; but when the Ministry modestly urges that it has tried to make Italy act on its own account, this is said to have been the grossest of blunders. Signor VISCONTI VENOSTA described the humble attempt of the Italian Ministry to settle the dispute about the frontier of Greece as an "odious initiative." To interpose in any way so that the tiny grievances of Montenegro may be amicably redressed was, in his eyes, a gigantic blunder, amounting almost to a crime. Signor CAIROLI made an excellent speech on behalf of the Ministry. He spoke the language of reason and common sense. He did not for a moment admit that Italy had come from Berlin humiliated or isolated. He stated that the Government had used, and would use, all its legal powers to discourage and repress the ambition of the fanatics who shriek for "Italia "Irredenta." He congratulated Italy on the excellence of its relations with Austria, and expressed a firm determination to keep these relations as good in the future as they are now. Where Italy has recognized and special interests, as in Egypt, Turkey, and Tunis, he will do all he can do to uphold these interests intact. Otherwise, he wishes to be quiet and friendly with all the world. There is only one reply to such a speech, and that reply is embodied in the order of the day, moved by Signor MINGHETTI. "Your policy may be good or bad," is the gist of this order, "but you are not the right man to carry it out. "We want to get rid of you and to come in ourselves. Very "likely we shall do exactly what you are doing; but then "it will be we, not you, who do it, and this will be eminently satisfactory to us." Scarcely anything could show more decisively how completely our system of Parliamentary government can be copied by those who pay us the compliment of imitating our institutions.

At a late stage of the debate, or at what would here be thought a late stage, for it was the sixth day of discussion, a representative of Italia Irredenta arose, and at least saved the Italian Parliament from the reproach of so incompletely representing the nation, that the feelings of one section of the people could find no expression in the Chamber. Signor BOVIO and those who acted with him were, he said, perfectly aware that nothing could be done at present to satisfy the national aspirations for Trieste and Istria, but they should feel happier if the Government would place on record that all Italy had those aspirations, and looked to time to bring with it the fulfilment of their hopes or claims. Signor BOVIO must have known that no Italian Government could put anything of the sort on record without preparing to face a war with Austria and Germany; but he had had his say, and that was enough for him. It is not in the direction of Trieste and Istria that an Italian Government, however it may be composed, has to direct its thoughts. Italy has difficulties to encounter in the determination of its foreign policy. These difficulties are not very great; but they are real. It must be allowed that it is puzzling for an Italian statesman to know what his country can fairly demand that he should do with regard to Egypt. There are more Italians in Egypt than any other class of Europeans, and Italian enjoys with French the distinction of being the recognized language of the tribunals. If Egypt is to be nursed by foreign Powers, it seems natural to Italians that Italy should have its share in the nursing. Italy has at different times tried to get its share, but has failed. It first tried to get an Italian Minister appointed when the late Khedive appointed an English and a French Minister, and if the attempt had succeeded, Egypt would now be under a triple

protectorate. France positively refused to let Italy come in as a partner in the management of Egypt, and England acquiesced in the decision of France. The system of governing Egypt by a protectorate may be bad or good, but it would be utterly impracticable if three Powers had to decide on every detail of a joint method of action. The Italian Opposition, after taunting the Left with its weakness in not insisting on a share in the management of Egypt, now adopts a totally different policy, and insists that Italy should uphold the independence of Egypt. By this is meant something very different from what is generally understood by the independence of a foreign country. It means that all Europe should have a finger in the Egyptian pie, and that Italy should join Germany and Austria in the endeavour to break up the Anglo-French Protectorate, and get Egypt under the tutelage of all the Great Powers. This policy is directed to a certain extent against England, but much more against France; for it was France that excluded Italy from the share she claimed in the arrangement of Egypt, and it is not in Egypt alone that France endeavours to prevent Italy from asserting herself as a Mediterranean Power. France has instantly interfered when Italy has shown any wish to occupy a position of exceptional influence in Tunis; and, as one speaker observed, France has actually the cruelty to impose a tax on fishermen plying their trade off the Algerian coast. This is a very small matter, and it did not need this humble argument to prove that it is now a settled part of French policy that, if the Mediterranean cannot be altogether a French lake, it shall be at least a French lake as far as Italy is concerned.

So far, then, as her position in the Mediterranean goes, Italy is drawn towards Austria and placed in antagonism to France. In her struggle with the Papacy Italy has no more to fear from Austria than from Republican France, and in this light she may regard both Powers impartially. But there is a third element in Italian politics which her statesmen cannot ignore. She cannot be indifferent to what may take place in the Balkan Peninsula. If she did not uphold the cause of the Christian nationalities, she would be faithless to the principles to which she owes her existence. And then, again, she naturally dreads the extension of Austrian territory. Italy has cheerfully acquiesced in the acquisition of Bosnia and Herzegovina by Austria; but she is most anxious, and every Englishman would, if he were an Italian, be most anxious, that Austria shall not go further. The prospect of an Austria holding Trieste on the one side, and coming down to the Egean on the other, is not a very cheerful prospect for an Italian. He cannot even extract any comfort from the calculation that Austria might break up under the dangerous process of extension. For he knows that, if Austria did break up, it might be the dreaded German who would become the neighbour of Italy at the head of the Adriatic. It is Prince BISMARCK under whose auspices the extension of Austria southwards is supposed to be likely to take place, and it is Prince BISMARCK who has informed the world that Pesth, not Vienna, is the true centre of Austrian gravity. Italy, however, finds that here France works with her, not against her. It is France that has done most for Greece, and if France finds courage to oppose Prince BISMARCK in anything, it will certainly be in the question of the future settlement of the Balkan peninsula. It may be hoped that no new settlement will be required for some time; but the incurable folly of the Turks makes it impossible to reckon with confidence on the peace of the East. There is an uneasy feeling through all Europe that Turkey may collapse any day, and that Prince BISMARCK may any day propel Austria forwards. Italians who share this feeling naturally consider to whom they are to trust when the hour of danger comes, and they cannot fail to see that their wishes and fears are precisely the same as those of France. Drawn away from France when they think of the Mediterranean, they are drawn to her when they think of the Balkan peninsula, and of the aggrandizement or disruption of Austria. For the present they wisely think that the best thing is to keep very quiet, and not to commit themselves for or against any one Power. But, however quiet they may be, they know that there may be difficulties before them, and their attitude is therefore necessarily that of an uneasy passivity.

LORD GRANVILLE AND THE GOVERNMENT.

LORD STRATHEDEN may claim the credit of having enlivened one of the last sittings of the House of Lords before the dissolution by giving occasion for a general political debate. The motion which furnished the nominal subject of discussion was not seriously noticed; and indeed it appeared that SHERE ALI's celebrated letter to the SULTAN is no better than a forgery. It had already been observed that the style and composition were not those of an Asiatic writer, and it was inferred that the Russian Envoy at Cabul was the author of the document. If the letter had been genuine, it had long ceased to be interesting, and indeed it merely served as an excuse for a speech expressing opinions held only by one person. Lord GRANVILLE professed to admit that Lord STRATHEDEN had a right to blame the Government for not accomplishing all the objects which were, in his opinion, desirable; but, as Lord BEACONSFIELD remarked, Lord STRATHEDEN is the only member of either party who can be described as a man of war. If he had had his will, the English Government would have quarrelled with Russia on every point of difference which arose in the course of a long negotiation. The Government, on the other hand, sought peace and ensued it. When Lord GRANVILLE asked whether peace had been maintained in Europe, Asia, or Africa, he knew that, although other Powers engaged in war, England had remained at peace in Europe. The short African war had nothing to do with general policy, and the Afghan war depends on special circumstances. Both conflicts were unwelcome and burdensome; but a war with Russia would have been an evil and a danger of very different magnitude. Between antagonistic Powers actually or approximately equal in force, compromise is the indispensable condition of peace. The Government gave up several claims which it might have willingly asserted; but, on the other hand, it obtained substantial concessions. Lord STRATHEDEN holds that all its demands were just, and hastily concludes that they ought all to have been enforced. Lord GRANVILLE would certainly not contend that the Government ought to have resisted by force the Russian acquisition of Kars, of Batoum, or of Bessarabia.

The debate, which took its rise in a spurious letter from SHERE ALI to the SULTAN, turned principally on an authentic letter addressed by Lord BEACONSFIELD to the Duke of MARLBOROUGH. No composition could be more obviously open to adverse criticism; and yet Lord GRANVILLE would perhaps have been well advised in leaving it as it stood. There was an undoubted impropriety in claiming for England ascendency in the councils of Europe, if supremacy or superiority was intended by the phrase. As a political term, ascendency is most familiarly associated with the former privileges which the Irish Protestants enjoyed at the expense of their Roman Catholic countrymen. Whatever may be the meaning of the word, it would have been more prudent not to advance a pretension which might have offended foreign communities, though it seems luckily to have escaped their notice. As Lord GRANVILLE said, Lord BEACONSFIELD could not be well advised in proclaiming the ascendency which he in fact possesses in his Cabinet and his party. If a verbal error had been committed, it was not the business of the Opposition to enable the Ministers to explain it away. Lord BEACONSFIELD himself, Lord CRANBROOK, and the LORD CHANCELLOR denied that any invidious claim had been made, and contended that the whole sentence was a protest against the tendency of Opposition speeches to impair the influence of England abroad. The author of the inculpated phrase was not especially luminous in his apologetic interpretation. "The word ascendency is one which involves important moral actions, and is not a word of offence, but one which will always be accepted in a liberal and generous spirit." As MERLIN said of his magic book,

> None can read the text,
> And none can read the comment but myself.

Yet, on the whole, the sage perhaps acquires some advantage by substituting the gloss for the original text. It is remarkable that no inquiry was made as to the meaning of "light and leading," which is said to be a quotation from BURKE.

Whatever doubt might attach to the interpretation of Lord BEACONSFIELD's letter, its general purpose was sufficiently clear. One of the most skilful masters of party tactics judged that it was desirable to concentrate the attention of the constituents on two or three prominent

issues. If they were not fairly raised between the Government and the Opposition, argumentative objections might perhaps not destroy the effect of general denunciations. In substance the leaders of the Opposition were accused of having impaired the influence of England abroad, and of having actively or passively encouraged Irish Home Rule. Lord BEACONSFIELD and Lord CRANBROOK have since explained that the low estimation in which at their accession to power English policy was held by foreign Governments was first disclosed when the Eastern troubles rendered intervention necessary. The composition of the Berlin Memorandum, and the manner in which it was prepared, certainly indicated a belief on the part of the three Imperial Courts that England had retired from the European concert. The refusal of the English Government to accept the dictation of the EMPERORS was regarded throughout Europe as a proof of the revival of national spirit, though it was communicated by Lord DERBY. There may be some difference of opinion as to the importance of foreign judgments of this country; for, as Mr. LOWE has justly remarked, the power of England is independent of the opinions which may be held at Berlin and St. Petersburg; but the inconvenience of an unduly modest and retiring policy is that vigorous demonstrations become the only methods of satisfying other Powers that it is necessary to reckon with England. It has fallen to the lot of Lord BEACONSFIELD in more than one instance to repair the shortcomings of Mr. GLADSTONE. The Cabinet which submitted to the modification of the Black Sea Treaty, and to the iniquitous terms of the *Alabama* arbitration, was at least liable to be misunderstood. The Prime Minister of the time seemed to delight in opportunities of advertising his own indifference or ignorance in matters of foreign policy. Mr. GLADSTONE professed not even to have heard of the indirect claims of the United States when they had become both irritating and dangerous; and on one occasion he expressed a doubt whether the kingdom of Prussia still existed after the establishment of the German Empire. Nearly all Continental politicians hold, not without partial inaccuracy and exaggeration, the comparative opinion of the character of the two Administrations which Lord BEACONSFIELD desires to inculcate on the constituencies. A proposition which has obtained wide acceptance may be unsound, but it cannot be incredible. The Government has achieved a certain triumph in the change which has lately taken place in the language of Liberal orators. Charges of the vague crime called Imperialism have entirely disappeared; and the Opposition candidates anxiously assure the electors that they will be as patriotic, and, if necessary, as warlike, as the Ministers whose turbulence they had habitually denounced. Liberals who have consistently differed from their party on foreign policy have displayed additional courage, and Mr. GLADSTONE himself in one of his railway speeches exhorted the electors of Newcastle to elect Mr. COWEN, knowing probably that, though he is a voluntary accomplice of the worst of criminals, his seat is safe.

A similar change in the tone of the Opposition has been effected in reference to Home Rule. Since the Liverpool election, Liberal speakers have been anxious to guard themselves against all suspicion of complicity in Lord RAMSAY'S ill-judged submission. They show a laudable simplicity when they exhibit surprise and indignation at Lord BEACONSFIELD'S assumption that his own party represents the unity of the kingdom. If they expected to be attacked on their strong points, they entirely misconceived the character and tactics of their assailant. The Irish political managers have themselves found it necessary to alter their whole system of operations in England. During the autumn and early winter they publicly tendered the votes at their disposal to the candidate who might be willing to make the largest concessions. Mr. PARNELL boasted to his American admirers that he could return forty members in Great Britain; and it was thought that some portion of his statement might possibly be true. At Liverpool it appeared that more was lost than gained by an alliance with a faction which ostentatiously professed to be alien in blood and indifferent to the contests of English parties. It is now believed that the Irish voters have been instructed to vote in all instances for Liberal candidates, on the ground that they may be expected to be more pliable than their adversaries. Lord BEACONSFIELD is not inclined to lose any advantage which his party may derive from even a one-sided alliance between two sections of his opponents. If the Irish Home Rule voters support the Liberals, it is a reasonable or plausible inference that, if they have not stipulated for an equivalent, they feel certain that they will obtain it. Lord GRANVILLE was perhaps well advised in restraining his apparent inclination to introduce a discussion on Home Rule into a debate on the Eastern question.

THE FRENCH GOVERNMENT AND THE SEVENTH CLAUSE.

THE French Left have been busy for the last ten days in flogging a dead horse. In the debate on the 7th Clause, the speeches of their representatives in the Senate showed a decided desire to prove that it was essential that the clause should be carried, and that it did not matter the least whether it was carried or not. At one time the Senate was assured that nothing but this invaluable product of M. JULES FERRY'S ingenious brain stood between France and a counter-revolution. At another time the clause was described as a compromise which the Left had offered the enemy out of pure charity, and which they would not be sorry to see refused. In that case they would be at liberty to show what terrible stuff they are made of. Hitherto the religious orders had only seen the ocean in its calm. If the Senate refused to turn them out of the schools, they should see the ocean in tempest. Since the rejection of the clause this last spectacle has been daily on view in the columns of the newspapers of the Advanced and Extreme Left. It cannot, however, as yet be said to be very terrible. The *République Française* in particular writes as though the end of the world were at hand. The battle of Armageddon was never painted in gloomier colours than is the contest between the Republic and the Church upon which France is now entering. Except in highly-strung leading articles there seem to be no traces of these tremendous possibilities. Worldly Paris and religious Paris go their several ways pretty much as though their hands were not to be at one another's throats in a few days' time. The means by which they are to be brought into contact is the enforcement of certain rusty decrees which have at various times from the reign of LOUIS XIV. onwards been made against the Jesuits. It was to these, under the modest name of "existing laws," that M. DE FREYCINET referred in his speech in favour of the obnoxious clause, and since its rejection a great deal more has been said about them. The position of the Government may be best explained by an imaginary English parallel. Supposing that the House of Lords in 1851 had thrown out the Ecclesiastical Titles Bill, and Lord RUSSELL had thereupon declared that the Government would fall back upon the unrepealed penal laws which had been suffered to fall into disuse, it is easy to imagine with what rapture this announcement would have been welcomed. The *Times* would have drawn solemn pictures of the evils that must come upon England if the Papal aggression were allowed to go unavenged. The Lords would have been warned that any inconvenience that might follow upon the application of the existing laws would lie at their door. Had they been so minded, they might have armed the Executive with more serviceable, because less formidable, means of defending the State against the Roman Church. Their refusal to do this had forced the Government to go to extremes. As Roman Catholic bishops were not to be forbidden to take territorial titles, the Executive had no choice but to examine whether it had not still the power to hang, draw, and quarter them. If it should prove that it had this power, it would now have no choice but to use it. The Lords had rejected mild measures, and they would be responsible for anything that might happen from the application of stronger measures. This is precisely what the Left are now saying in France. Though France is a Catholic country, there is a large armoury of obsolete legislation against any phase of Catholicism which the BOURBON monarchs happened to dislike, and the Left are not at all above using one enemy to hurt another. Their organs are wisely silent upon the question how much of this legislation is still available. If they were really resolved upon trying the experiment, this would be a very important point to consider; but, as in all probability they are only making believe very much, it does not greatly matter. The "existing laws" will do to supply a text for articles until such time as some newer subject presents itself; and then, having answered their purpose, they will be restored to their congenial obscurity.

M. DE FREYCINET is just the Minister to handle this

frame of mind judiciously. There is not the slightest ground for believing that he shares in any degree whatever the alarms which are attributed to the Left by their favourite journals. Probably, indeed, there is no member of the Cabinet who does share them. Hope of doing a good turn for himself had much more to do in inducing M. FERRY to frame the 7th Clause than fear of any bad turn that the Jesuits were likely to do him. M. DE FREYCINET, in particular, has given abundant indication of being in his sound mind upon this question. When he made his oratorical tour some time back, the text upon which he most dwelt was, not the necessity of protecting the Republic against the Church, but the necessity of not giving the Church any cause to be frightened at the Republic. At least the theme of every speech was the importance of winning converts to the Republic, and in a Catholic country converts are not likely to be won to the Republic if the Republic takes to proscribing religious orders. M. DE FREYCINET'S speech in defence of the 7th Clause pointed in the same direction. A Ministerial measure was never advocated by a Minister with so little enthusiasm. He did not pretend to think it necessary; he did not pretend to say that if it was passed he meant to put it into execution. The one reason he assigned for asking the Senate to vote it was that it would come to nothing, and that the Chamber of Deputies would be kept in good humour. Leave it to me, he said in effect, and you will see that the Jesuits will be in no way the worse for the clause, while I shall be in a much more comfortable position as regards my supporters. The Senate declined to look at the question in this easy-going way; but it is not likely that the rejection of a clause for which he cared so little has made M. DE FREYCINET a fanatic.

What he has done since is quite consistent with the tone he then adopted. When the 7th Clause was offered a second time to the Senate, M. DE FREYCINET declared that he had nothing more to say, and that the Government had accepted the duty of applying the existing laws. On the following day he made a similar statement to the Chamber of Deputies, and the next thing to be seen is how he will set to work to perform the duty he has accepted. We shall be exceedingly surprised if he really performs it at all. A circular may be addressed to the prefects or to the magistrates telling them that certain laws against religious congregations, though they have been allowed to fall into disuse, have never been repealed, that it has become necessary to consider how they may best be put in force, and that the Government desires to hear what are the numbers and position of such and such orders in the department. What hints will at the same time be given to the officials entrusted with the preparation of these reports is another question, and in a matter of such moment it will obviously be impossible for the reports to be produced. The public attention will be kept on the stretch until such time as it finds something more amusing to occupy it, and a large number of nervous ladies will be continually expecting to see their favourite preacher carried away to gaol, or shipped off to Cayenne. By degrees the whole affair will be forgotten, and at last the journals of the Left will solemnly assure their readers that the mere dread of the laws being applied has proved sufficient to bring the religious orders to their senses, and that they have wisely abstained from doing anything which could force the Government to proceed against them. After every allowance has been made for the folly and the fanaticism which have traditionally distinguished French Radicals, we cannot believe that they would have the strength to push any Government into so disastrous an enterprise as a conflict with the Church would certainly prove. The Republic under which the French nation wishes to live is a Republic framed on modern ideas, not on the doctrinaire extravagances of 1793. In such a Republic the religion of the majority of the people must be taken into account just as much as their land or their family life. To ask them to abandon the Church is like asking them to give up the principle of private property, or to make the marriage contract terminable at the pleasure of either party. It is true, no doubt, that the existence of religious orders is not indispensable to the existence of Catholicism as the religion of the majority of Frenchmen; but, if the Catholic Church chooses to treat the connexion as indissoluble—if, that is to say, she insists upon doing a great part of her work by the instrumentality of religious orders—it comes to very much the same thing. The POPE is not likely again to throw the Jesuits overboard, though, if he is temperately dealt with, he will probably be quite willing to moderate a zeal which, in his estimation, is not invariably according to knowledge. The practical politicians of the Left are not likely to lose sight of these simple but pertinent facts, and the execution of the penal laws will, in that case, gave occasion for much declamation and for very little else.

LONDON WATER AND LONDON RATEPAYERS.

MR. CROSS has succeeded in contributing a paving-stone of extraordinary size to the region of which good intentions make the floor. It is perfectly easy to trace in imagination the steps by which he conceived his too famous bargain with the London Water Companies, and, taken by itself, each step seems highly natural and proper. He began, no doubt, by reminding himself that a friendly arrangement, if it could be arrived at, would be in every way better than an arbitration. Arbitrations mean arbitrators to arrive at conclusions, and counsel to provide materials for conclusions, and both are expensive luxuries. On the other hand, the Water Companies would naturally not consent to forego arbitration unless the terms offered them were fairly favourable. Thus Mr. CROSS began his investigation under a bias—an inevitable and reasonable bias—but still a bias. Every step in the negotiation was regarded as affecting the question, Will the Water Companies care to accept this? The first consideration that offered itself was the income the shareholders were actually making. The form in which the value of an investment presents itself to the ordinary English holder is that of a half-yearly dividend; consequently, if Mr. CROSS had offered to buy the stock of the Water Companies at the price which it would have fetched before it was known that the Government had such a purchase in their heads, the shareholders would naturally have objected that, as long as their shares went on paying them a large percentage, they had no intention of taking a much smaller percentage in exchange. By meditating on this Mr. CROSS arrived at the conclusion that the shareholder's income must be taken as the basis of the bargain. If a certain stock brings its holder 100*l.* a year on what he thinks fairly good security, he will not be inclined to take 50*l.* a year in exchange for it on a better security. If Mr. CROSS had stopped here all might have gone well. But, unfortunately for the Government, the actual and immediate dividend is not all that a holder of Water Company stock has to look to. The Legislature has been extraordinarily kind to this class of investors. While the Gas Companies have to content themselves with charging for the amount of gas consumed, and contrive to make a not despicable profit by doing so, the Water Companies occupy a far more dignified position. They stand on the same level with the municipal authorities, and take payment not as the price of water supplied, but in the shape of a percentage on the rateable value of houses. The consumer may be a man who never uses water except for cooking and washing, or he may be the President of a Total Abstinence Association, but neither fact will be considered in his water rate. Even empty houses are supposed to be water drinkers to the extent of half the rate. It further happens that the value on which the rate is assessed is not merely a very various quantity, but in many parts of London a very growing one. Not only does the same man pay a very different sum for precisely the same quantity of water, according as he lives in one house or another; but, if he happens to live in an improving neighbourhood, he will pay a larger sum for the same quantity of water every time that his house is revalued. In the natural course of things, therefore—assuming the maintenance of this absurd regulation to be the natural course of things—the Companies would be entitled to charge more and more for their water as time went on, and presumably in future years to divide a larger dividend than they have ever divided yet. Mr. CROSS was evidently impressed by this reflection also; and, under its influence, he devised the scheme of a deferred stock. The shareholders were to be paid, not only the full amount of what they now receive, but also a certain further sum in lieu of what, if the Government had not interfered, they might have looked to receive at some future day.

This is the element in the transaction that has broken the ratepayers' backs. Had the shareholders only been paid a price which would have given them the income

they are now receiving, we question whether the terms would have excited much opposition. No doubt the position of the shareholders would have been immeasurably improved. They would have got the same income, on first-rate security, as they had been getting on security which, though it bore a fair character in the market, was still very inferior to the water-rate created by the Bill, plus the general rates of the metropolis. But it is so much the custom of Englishmen to look at the amount of income rather than at the quality of the investment, that this would not, we fancy, have struck people as an unfair bargain. They would have argued that the shareholders were not anxious to sell their property; that the Government, acting as the representative of the London ratepayers, was tempting them to sell; and that, so long as the security they possessed was good enough for their purpose, they could not be expected to exchange it for a better if the exchange involved a considerable loss of income. But when the Deferred Stock came into view, the whole aspect of the question was changed. The present arrangement about payment for water is so obviously and absurdly unfair, that the ratepayers had a perfect right to challenge Mr. Cross's assumption that it was going to endure for ever. Supposing the Act which enables the Company to charge more and more for precisely the same article were to be repealed, the claim to a Deferred Stock would melt into air. To offer such terms to the Water Companies as were offered in the Government Bill would have been to saddle the ratepayers for ever with the cost of a blunder which might any Session have been put right by a stroke of a draftsman's pen. When Mr. Cross said on Tuesday that, if time had allowed, he would have been able to show clearly what advantages the ratepayers would have received under the Bill, he left out of sight the real pinch of the controversy. No one denies that the ratepayers would have received advantages under the Bill, and merely to get rid of the Water Companies would have been a very great advantage indeed. But the question is whether the ratepayers could not have received the same advantage from a very much smaller outlay, and unless Mr. Cross had been able to show this also, he might as well have held his peace.

The truth is that Mr. Cross began the negotiation at the wrong end. Instead of setting to work to consider what terms the Companies were likely to accept, he should have considered what he could do to place himself in a commanding position with regard to the Companies. The London Water Companies have no guaranteed monopoly of the water supply. A rival Company, proposing to supply London with better water and on a better system, might at any moment have been set up if Parliament had chosen, or the metropolitan local authorities might have been authorized by statute to furnish such improved supply either by buying up the present Water Companies or otherwise. A hint that the Government had either of these plans in contemplation would have been sufficient to bring the Water Companies to their knees. The quality of the present supply is certainly open to question, even if we allow, as we are quite ready to do, that it is better than much of the apparently purer water which people drink in the country. The machinery by which it is introduced into houses is often exceedingly faulty. The price charged for it seems large enough to give the purchaser a right to something better. All these considerations pointed to an intimation on the part of the Government that they would be disposed to give a favourable hearing to any scheme for giving London a better supply of better water, either by means of a new Company, or by entrusting the power of obtaining such an improved supply to the Corporation of London and the Metropolitan Board of Works. After such an intimation as this, Mr. Cross would have found the Water Companies very much more easy to deal with. If, after all, he had wanted to buy their stock, he would have been able to buy it at something very much nearer a fair price than the exorbitant sum which he actually offered.

ANOTHER EGYPTIAN QUESTION.

It is a curious fact that hitherto so-called classical scholars have neglected Egypt. English historians of the new school, using the light of scientific knowledge, have one by one attacked the old strongholds of Greek, Roman, English, and other traditions, and have placed the history of Europe on a fairly sound foundation. We know how cultivation and learning spread. We have the codes of various schools of law. We have traced architecture to a very remote period. We have applied our scientific methods even to the Bible, and it cannot be said that the result—so far as any result has been attained—is unsatisfactory. But there is a point beyond which none of these investigations go. It is sometimes objected to Egyptian research that so much must in any case remain uncertain, such long periods of years must after all be left in the obscurity in which we find them. This is an imbecile objection; but we do not wonder, when we look at the most popular books on Egypt, that scientific and classical scholars of history refuse to enter the labyrinth. The interest truly is great. We find a civilization in Assyria at a very early period. But the civilization of Egypt is older by far. We find the Greeks great in art and writing at a period which may be placed at half a millennium B.C. Where did the Greeks get the Doric column? Where did they learn their letters? In Egypt. We find the Etruscans burrowing into the rocks of Italy and painting on the walls of their grottoes representations of feasts and merrymaking for the entertainment of their souls deceased. Whence did the Etruscans learn the immortality of the soul and imitate these strange pictures? The only possible answer is, From Egypt. There are some among us who would give the same answer if asked for the origin of much of the Mosaic law, or the origin of glass-making, or the costume of mediæval priests, or the divisions of the solar year, or the measure of feet in verse, or the invention of harmony in music. In fact, if we go far enough back into the history of any art or science, we come to Egypt. There, for the most part, we stop. The further prosecution of inquiry is made disagreeable or impossible because of the unscientific method which has been applied to it. The business of investigating the remains of the three great civilizations which at different times flourished in the Nile valley has been left to foreigners, almost entirely—the few Englishmen who have pursued the study of hieroglyphs and the ancient language of Egypt being for the most part, or altogether, voluntary students already engaged on some other subject. So far the greatest masters of interpretation in England have been content to follow the systems of foreign decipherers; and the idea of distinguishing between the different periods of the history and language has been almost wholly set aside. Some months ago we had occasion to complain of this confusion in the arrangements of our great national collection. We cannot say that this confusion is not equally apparent in the department of literature. We have no professors of Egyptian literature, yet it might be supposed, antecedently to experience, that all literature turns on it. We have no professors of Egyptian history, yet there can be no doubt that the obscurities of early European and Asiatic history might be removed if we knew something of it. We talk of the Pelasgic, the Etruscan, the Phœnician migrations. Yet we never attempt to connect them with the revolutions which caused them; we cannot identify with any certainty the names of the Mediterranean nations mentioned in the inscriptions of the second Egyptian Empire; and so much the more are we ignorant of the peoples mentioned and described by the scribes and artists of the first monarchy. It is absolutely certain that a large number of the most difficult problems which at present puzzle investigators into the early history of the Italian and Greek peninsulas might be solved by an intelligent reference to Egypt. To take a single example of the neglect of this branch of classical study—or study which should be classic—let us suppose an examination in which a student of Greek is asked to trace the letters of the Greek alphabet one by one to their origin in the hieroglyphs. Not one student in twenty thousand could give a reply—not one examiner in twenty—or shall we say a hundred?—could judge of the correctness of the answer. Yet what a number of important literary questions must turn upon such knowledge it requires only a moment's thought to estimate.

The diggings which for a number of years were carried on in Egypt, under the superintendence of a French antiquary appointed by the Government of the Khedive, resulted in unexpected discoveries. No book, even the best, on Egyptian history or art, written above ten years ago is now of absolute value. Everything has been revolutionized. We have had revealed to us a world of which we knew nothing. The mist which hangs so darkly over what we talk of as the Bronze age or the Stone age, or what not, has been partly removed, and a vista, long distant, like that which Christian had through the perspective glass, has been opened to us of a primitive people, dwelling in a happy valley bathed in sunshine, where the seasons changed regularly, where the earth yielded its increase in plenty, "where never wind blew chilly," where never drought scorched, where the arts were in perfection, painting and architecture and sculpture, where writing recorded events, where law regulated deeds, where religion comforted the sorrowful. All this and much more we have had revealed to us of an epoch so remote that we cannot date it—an epoch as long before that which most English writers intend by the phrase "Ancient Egyptians" as that is from the Christian era. These researches, so important to the history of all mankind, have been now for several years discontinued. The want of money, from which every one in Egypt, except the late Khedive himself, suffered during the last years of his reign, put an end to the diggings, even though they had been in too many cases carried on by the help of labour which, if it was not forced, was at least not voluntary. There were some who rejoiced at the cessation of these works. Enthusiastic lovers of the fellah, when they heard that golden orna-

ments had been added to the Museum, used to inquire much too inquisitively whether the peasant who found them had been paid a fair price for them. In too many cases, unless the French and German directors of these researches are terribly maligned, the feelings of the people were not considered. Several students of old Egypt and its remains have nevertheless been engaged in advocating the formation of a fund for the purpose of continuing the search for records of the early history. We sympathize with them, but only to a certain length. We should be glad to see an English society of the kind organized. The French—at the least those Frenchmen who have hitherto shown themselves interested in Egypt—have not conducted their operations in a way to conciliate the people. There is a very curious passage on this subject in the book of a French author (M. Rhoné), who is one of the most pleasing of modern writers on Egypt, and enjoys the confidence of the French authorities at Boolak. He says, after speaking of the universal Oriental phrase "sa parole Anglaise" as a guarantee of good faith, that an Englishman has the tact to respect the dignity of an Eastern, to humour his susceptibilities, and to treat him as an equal. He can sustain cordial and honourable relations with him, and "hence, in great part, the preponderating influence which England enjoys in the East takes its birth." M. Rhoné does not stop here. He also puts the other side of the question. "The French, and even those most distinguished by education, make, it is said, the mistake of disdaining Orientals in general, whatever their rank and personal standing. They look upon them as barbarians from whom they have the right to demand obedience, and whom they can treat as revolted slaves when their services are refused or ill rendered." Those who know Egypt best will dread giving countenance to any movement calculated to put Frenchmen of a scientific turn into authority over Egyptians.

The regret with which such observations as the above are made is increased when we reflect on the importance of the objects to be gained by further researches, and the difficulty of obtaining either the financial or political sinews for the employment of competent English investigators. An expedition to the North Pole which can add little, perhaps nothing, to our knowledge, will cost more than ten years of such diggings as we would see undertaken. Forced labour in any shape or form whatever would be intolerable to the English mind. Labour is cheap enough in Egypt to enable magnificent works to be carried on at a very moderate expense. There might be further researches on the site of This, further inquiry for papyri, special investigations of the obscure period of the Foreigners after the Sixth Dynasty, and the so-called Hyksos, after the Twelfth. It is rather in Egypt than from surveying remote quarters of the land of Canaan that information as to the Israelites may be obtained. The study of the oldest of all documents can never be properly carried on until we know where each scarab bearing an inscription was found; and to this end it would be necessary to have a competent scholar on the spot during the summer months. It is then that antiquities are uncovered in digging away old mounds, and dealers in such things collect them at the country fairs, week by week, but keep no record of whence they came. Antiquities so discovered should be left in the country, as the German Government has left the antiquities of Olympia, and as Dr. Schliemann has left what he found in Mycenæ. The Khedive is not likely to refuse his sanction to a scheme which would mean the spending of money in remote parts of his country. The Boolak authorities could hardly object to an expedition which would so greatly add to the number and value of the objects in their collection. The difficulty would be, not so much the financial one—for money would surely be forthcoming—as the men. The scheme is one which can only be worthily taken up by the Universities, and research should be directed, in the first place, not to the manners and customs of the three or four different nations whom we class ignorantly together as Ancient Egyptians, but to some one point at a time, as the object to be aimed at. The number of such points is so great, and their relative importance so difficult to assess, that we must postpone their consideration for the present.

CHESS.

THE question has been over and over again argued whether chess or whist be the more scientific game. We generally find that those who play whist well and chess indifferently think more highly of the one in which they excel; but we invariably find a good chess player who is also a poor hand at cards maintain the great superiority of his own game, on the ground that the element of luck has no place therein. This argument is not, however, conclusive. It should be remembered that luck, like water, finds its level in the long run. How often one hears a man exclaiming against "my luck"; "I am never lucky at cards"; or, "I have put ten years running into a Derby lottery, and have never won anything yet"—quite oblivious of the fact that numbers of people have been competing with him on perfectly equal terms. The true answer to all theories about fortune at cards is, of course, that in due time one colour or number will win just as often as another, and that every player in games of pure chance is consequently on the same footing. But successful whist-players do not win by luck. We are not about to make a detailed comparison between the two games, and indeed we are disposed to hold that there are far more differences than likenesses between chess and whist. In the former the battle is fought on an open plain where thirty-two combatants are all visible to each other; in the latter only four out of the fifty-two fighting men are at any time engaged; the rest are ambushed in reserve, and their quality can only be divined by watching the result between the actual combatants. In the former game the plans of a player cannot be frustrated by any freak of fortune; in the other the best calculations may be fatally disarranged by unforeseen contingencies, or through the blunders of a partner. Again, a different kind of talent, or the same talent in very different degrees, is called into exercise; whist demands delicate *finesse*, chess more caution or circumspection; whist makes a greater tax upon the memory, chess upon the faculties of observation and concentration; in the first there is more calculation of probabilities, for deductions must be drawn in great part from uncertain *data*; in the last there is more calculation of visible possibilities. The probabilities are here far more easily ascertainable than in whist, for a skilled performer can at any rate see pretty clearly in what direction and with what force his antagonist is pushing, and far oftener than not he will divine a plan which nevertheless he may not be able to forestall. But he has to reckon on a vast number of possibilities as well on his own side as against, and to remember that every one of the thirty-two combatants has a power of its own and a possible line of action both by itself and in combination. There is no divinity hedging a king at cards, who is liable to be taken by the smallest trump, or may be dragged in the wake of the winning card of another hand; in chess a piece may become useless through being blocked, but its power is only suspended by circumstances and may be fully recovered. Lastly, chess demands, on the whole, in a larger degree than does the other game, the instant seizure of the right moment for the right move: the effect of a wrong lead may often be partially recovered, but against equal play the effect of a false move is not to be undone; and, in the former case, the penalty may be only the loss of a point, whereas in the latter, unless error answers error, the first mistake must lead to the loss of the game. We need not dwell on such features of resemblance as may exist between these two favourite pastimes, merely remarking that in both book study should be made the groundwork by all who aim high. We know that this opinion will be called in question by many practical whist-players, who deride book theories as never fitting in with the experience of actual play. All that is wanted, they will tell you, is to remember the cards that are out, to watch the cards as they fall, and to use a little ordinary common sense. Perhaps the race of warriors is not even yet extinct who look down on book study as a means of developing military capacity. But how true does the experience of every succeeding war prove the *dictum* of Napoleon to be, when he says, "Study the campaigns of Cæsar, Hannibal, Alexander, Gustavus Adolphus, Turenne; penetrate yourself with the spirit of those great men. That is the way to become a leader and to understand war." The advice applies in every pursuit of art or science; but it is only an intelligent minority who, entering into the spirit of a theory, are able or will take the trouble to suit the rule to the occasion and not the occasion to the rule. If, as we hold, book study is profitable at whist, it is in chess quite indispensable to such as have the ambition to be masters.

There are in England, as in nearly every other country, a vast number of chess amateurs. A few choice spirits stand not so very far from the top of the ladder, while every lower step is more thickly peopled, and a large crowd is gathered at the bottom. Why is this the case? Some will say that most persons cannot afford to give up sufficient time to become proficients at what, after all, is only a game. No doubt this is partially true; but it does not explain why so many never rise from the ranks who day after day, or night after night, may be found poring over the board. There are two other reasons for the very general mediocrity; one is that, to excel, a man must have good brains and a taste for exercising them in this particular line; another, that the art of opening a game is neglected. We remember that the late Mr. Staunton, himself an eminently scientific student, as also a brilliant executant, used to insist on the necessity of studying "that most important feature in chess—the art of opening the game." What would be thought of a general who did not know how to commence an action? or of a battalion leader who could not dispose his men in suitable fashion for attack or defence? On the tiny field of chess the same combinations are required as on a theatre of battle. In both the first consideration is the disposition of the lines of operation in the most advantageous manner; the second, the skilful concentration of the forces with the greatest possible rapidity upon the vital point of the enemy's line; the third, the simultaneous employment of these forces upon the point aimed at. How can all this be brought about against science but by opposing science? Not the most assiduous porer over abstruse variations will necessarily develop into a Morphy or a Staunton; but familiarity with the openings will often enable a player to obtain such initial advantages of position that his more dashing but less scientific opponent will fail to recover subsequently the lost ground. The great secret of obtaining this initial success may be learnt entirely and solely from books. The acknowledged authorities on the art, such as Salvio, Lewis, Staunton, La Bourdonnais, Philidor, Ghulam Kassim, Jaenisch, &c., are sufficiently agreed in most cases as to which are the best ten or twelve moves for either side in the different openings to make any one of them a trustworthy guide.

There are also several ably conducted chess periodicals in England, Germany, France, and Italy, which may be profitably consulted. Noticeable amongst these is the *Chess Monthly Magazine* (Dean and Son), lately started by the eminent professional Herr Zukertort. We can from diligent perusal strongly recommend this publication to all players who like to go over games fought between masters of the art, and to learn from the sound criticism given the why and wherefore of the moves. Without such detailed criticism it is often difficult to follow the intentions of the players. After the first ten or twelve moves we begin to find our authorities differing widely as to the best course to follow. When we consider that the advance of a simple pawn may give rise to variation upon variation, and that any move in any direction modifies more or less the general situation, it will readily be seen how manifold are the complications which arise, and what demands are made upon the intellectual and moral, and even the physical, qualities of the performers. There are the *pros* and *cons* of various courses to be rapidly summed up, *ruses* and false attacks to be guarded against, and means devised for entangling the foe. There is a call for perseverance, coolness, or, it may be, for courageous initiative. And few who have not a *mens sana* encased in *corpore sano* can hold their own in the acute phases of a long ordeal.

We can trace the existence of the game of chess as far back as some two thousand years ago. Whoever was its inventor—he probably hailed from China—had the game of war in his mind's eye. And it was an Asiatic army which was represented, as we gather from the composition of the forces. For aught we know, it may have been the *kriegsspiel* or war-game designed to give, in miniature, instruction in the then theory of war. During the last few centuries the power and scope of the pieces have undergone marvellously little alteration when we consider that the game is in vogue in almost every country throughout Asia, Europe, and America. Revolution has penetrated everywhere else the thresholds of sovereigns and of feudal nobles; but here the kings, queens, bishops, and knights have preserved their conservatism intact; and the "peasants," as the Germans now designate the pawns, though they have been conceded some small privileges, have never clamoured for radical changes in their estate. It is curious to note how some of the pieces are differently named in different countries. What we call "knights" are in Germany "leapers," so termed, of course, on account of the faculty they possess, and which is peculiar to them, of leaping over the heads of friends and foes alike. The "castles" were formerly "war-chariots," but are now called "rooks," after the Indian *roth*. The pieces we call "bishops" the French call "fools." Formerly these were elephants, carrying in their howdahs warriors of renown. In the East the "queen" of European boards is designated "vizier," which would seem to be a more appropriate appellation for a powerful combatant. Before the pawns were styled "peasants" the Germans had dubbed them *Wenden*, or Vandals, a term of contempt or expressive of their feeble action. The French call our "castle," which goes equally by the name of "rook," a "*tour*." We do not know that we have anywhere met with the observation, but it has doubtless struck many persons that national characteristics find, comparing small things with great, as much their expression in combats at chess as on theatres of war and enterprise. In the great match between England and France, fought some thirty or thirty-five years back by Mr. Howard Staunton and M. St. Amant, an examination of the numerous games shows on the part of the latter greater *finesse*, more inventiveness, more dash, combined with uncertainty of aim; on the English side, more judgment, less speculation, more determined "hard pounding" on a definite point. But, not to judge from an isolated instance, if we search the voluminous military history of chess, we shall find in the performances of such Frenchmen as La Bourdonnais and Philidor more of genius and brilliancy; in those of such Germans as Anderssen (who, however, is credited with the "most brilliant game on record"), Von H. der Laza, and Jaenisch, more of science and depth; in those of Englishmen, such as Staunton, Lewis, Cochrane, more of sound practical judgment. Every quality has of course its value in its proper place; and genius has sometimes stolen a march upon the slower judgment. Some twenty years back America sent over to Europe the youthful, but peerless, Paul Morphy. He came, he saw, he conquered. Such an exhibition of skill was never before seen, and has not been seen since. The most accomplished players in the Old World were vanquished one after another; and, if ever genius and judgment, boldness and caution were duly combined, they were so in this wonderful player. It has always been matter for regret with patriotic chess enthusiasts that our own great champion, Mr. Staunton, was unable to arrange for an encounter with the conquering American. The Eastern world has produced first-rate players, one of whom, Ghulam Kassim, of Madras, was a distinguished writer on the subject. Italy had sent forth redoubtable performers and excellent critics at a time when chess was almost unknown here. As scientific and thoroughly exhaustive critics, however, the Germans, it may well be believed, more than hold their own.

We should be making a grave omission did we not refer to the fact that, as in every other department of intellectual activity, so in chess, the ladies are resolved not to leave man alone in his glory. Ladies' clubs have been formed in this country, and their members contest with men on even terms. But America has thus far produced the best lady player. Mrs. Gilbert, of New York, in a recent match with a well-known gentleman performer has been astonishing the chess world by her feats of prescience, doing what we never knew done before—namely, announcing, twenty or thirty moves beforehand, the exact process by which she intends compassing the destruction of her antagonist, and carrying out her threat at the point indicated to the very move. But, as a rule, the physical strength of women is not equal to a prolonged struggle. We fancy a good many ladies would like for the nonce to enjoy the imperial prerogative of Napoleon, who, according to Mme. de Rémusat, insisted upon moving his own pieces as he liked, crediting them with exceptional powers in cases of urgency. We can easily believe he always won. He most undoubtedly used to cheat at cards; but then, as he frankly explained, was it not his object to win? How these little circumstances illustrate the later phases of the man's career who had come to regard every moral and physical obstacle, fortune and time itself, as so many things to be made subservient to his own iron and reckless will. Half the catastrophes inducing his downfall were due to his ignoring the existence of a law of nature superior to himself. There are curious, but well authenticated, anecdotes showing what fascinations chess possesses for some minds. We have heard of one of Her Majesty's ships being nearly run ashore through the captain, absorbed in his combinations, not heeding the repeated representations of his lieutenant that they were getting uncommonly near the land. There was once a caliph of Bagdad who would not be disturbed in his game, though his city was being carried by assault. And Charles XII. of Sweden, when hardly beset by the Turks in his house at Bender, was at least as much interested in beating his antagonist across the board as in beating off the Turks. Again, an Elector of Saxony, taken prisoner at the battle of Muhlberg by the Emperor Charles V., was playing chess with a fellow-prisoner when tidings were brought to him that he had been sentenced to death. He looked up for a moment to remark upon the irregularity of the proceeding and then resumed the game, which, to his great delight, he won. When we add that Frederick the Great and Marshal Saxe were enthusiasts for the game, who will say it is not a pastime in which it is worth while to excel? Though many persons are debarred by other occupations from devoting to it sufficient attention, those who have the leisure may remember the dictum of the Duke of Wellington, which is applicable to all pursuits, that "what is worth doing at all is worth doing well."

INSTRUCTIONS TO A PAINTER.

TWO very well known passages of two very different poets, Burns and Professor Wendell Holmes, have expressed happily enough the difference between men's views of themselves and other men's views of them. There are certain of the latter class of character-studies which would, just at the present moment, be decidedly interesting if they could be got at. Last Saturday, for instance, Lord Derby completed the series of strategic movements by which he has retired from connexion with the Conservative party and declared himself to belong to the enemies of that party. What does the Opposition think of its new ally? and particularly what does Mr. Gladstone think of Lord Derby? Probably Mr. Gladstone would decline to answer that question, even as, with remarkable judgment, though contrary to Scotch practice, he declined to answer some inconvenient questions of his Conservative hecklers at Edinburgh. But, supposing Mr. Gladstone to be an inmate of the Palace of Truth, and to be interrogated in that less convenient abode, what result should we get? There is proverbially joy over one sinner that repents; and, as Mr. Gladstone more than once in his life has been in the position of a person who finds it advisable to change parties, he is not likely to be, in the abstract, hard upon Lord Derby for this act. Besides, he has left the wrong side and come over to the right, which, to persons of Mr. Gladstone's temperament, makes a vast difference. His plaintive expostulation with Providence at Hawarden not long ago as to its strange conduct in allowing men of virtue and intelligence to be Conservatives, may be thought to have received a partial but gracious answer in this distinguished conversion. But is Lord Derby, from Mr. Gladstone's point of view, a person of intelligence and virtue? That is the question. Certainly there are difficulties in the way of an affirmative solution. In one of those remarkable wayside speeches, in which Mr. Gladstone puts his head out of the window of a carriage and shakes his fist at the Government like the comic father pursuing a runaway couple to Gretna Green, the following passage occurs:—"For the last six years England has been principally employed in promoting the interests of arbitrary power." Now, for at least four of those years Lord Derby was a prominent and active agent in this promotion, and he has not, as far as we know, purged his offence by any apology or penance. In no one of the remarkable series of confessions which relieved his mind two years ago did he hint that anything in the policy of the Government up to the time of the active measures taken to check Russia was contrary to his views. The whole earlier course of that policy which, far more than the later, attracted Mr. Gladstone's wrath and denunciation was accomplished with Lord Derby's consent and (as far as direct agency went) by himself. The points of contact between the two statesmen are therefore few and comparatively unimportant, the points of difference many and grave. How does Mr. Gladstone reconcile himself to this? Probably with the aid of the invaluable *distinguo*, of the excellence of which his philosophical and casuistical studies must have convinced him. Just as at Edin-

burgh the other night, Mr. Gladstone with great *naïveté* observed in effect that he objected to the faggot votes created against him, but had as yet seen nothing to object to in those created on his side, so it is probable that he has distinguished between the Lord Derby of two years ago and the Lord Derby of to-day. The latter is too valuable a friend to be slighted, the former is buried in a magnanimous oblivion. Yet Mr. Gladstone has not always shown himself possessed of a bad memory or a forgiving one. So that we shall probably be safe in assuming that Mr. Gladstone's Lord Derby (to use the phrase of the American poet and essayist) is a person with considerable influence in Lancashire, who has been induced to give that influence to the Liberal party. This leaves the distinguished proselyte but a faint personality, and perhaps not a very dignified attitude, but more than this we can hardly attempt to fill in. At one period of the seventeenth century it used to be fashionable to couch satire and flattery in the form of instructions to painters, who were charged not to forget this and that feature of the subject. Our painter would have rather a difficult task in this instance, yet, if he could accomplish it, it would be an interesting contribution to an interesting gallery.

A companion portrait would be much less difficult to paint. What does Mr. Gladstone think of Lord Hartington? The general outline of the picture is easy enough to indicate. The heir of the House of Devonshire doubtless seems to Mr. Gladstone a good young man sent down from heaven to raise the hopes of the Liberal party at a difficult moment, and to keep his own place warm for him. The details of the representation may be a little more conjectural. From Mr. Gladstone's well-known and frequently enunciated contempt for the House of Lords, which can only pass decently good measures by the aid of special Divine interposition, he can hardly fail to entertain something of a similar feeling—mixed, doubtless, with compassion—for one who is destined, unless accident forbids or Mr. Gladstone himself thinks his three thoughts with unusual rapidity, to figure some day in that unfortunate assembly. This element of weakness in Lord Hartington's character our painter will have to take account of, as also of another. Mr. Gladstone ought to have sympathy with his follower, or leader, or rival, or colleague—all the terms being more or less appropriate—for his dexterity in shifting sails to suit the wind. But the late Premier can hardly think altogether approvingly of the manner of Lord Hartington's performance of this nautical manœuvre. In the matter of the Army Discipline Bill, as in that of the Liverpool election, Lord Hartington showed himself slightly susceptible to bullying. It is only fair to Mr. Gladstone to say that he himself is not a good subject for that process. You may gently lead him either by blowing up a gaol and murdering a policeman, as is the Irish manner, or by peppering the highest in a contest of highly-spiced flattery, as is the manner of Scotchmen and of the English Nonconformists. But for direct brow-beating *à la* Chamberlain, Mr. Gladstone has, to do him justice, too proud a stomach, unless it comes from foreign Powers. It is also probable that Lord Hartington's tendencies towards common-sense argument slightly revolt his late chief. The sometime Postmaster-General, he must think, is fatally deficient in superlatives. He does not refer sufficiently often to the "last drop of his blood" and the "last breath in his body," according to the picturesque but harmless vocabulary which in Mr. Gladstone's mouth replaces the still more picturesque, but not so harmless, expletives of the streets. Still we cannot doubt that the portrait of Lord Hartington, drawn according to Mr. Gladstone's instructions, would be on the whole complimentary. It might be described in the catalogue as "Portrait of an Amiable and Judicious Young Nobleman," and there would be great scope for an inscription such as that to which some exhibitors at the Royal Academy are prone. If this inscription, like the character of Lord Derby, were composed in the Palace of Truth, it would probably run as follows:—"He is a useful piece of furniture, never out of the way (except sometimes when the frivolities of hunting and racing allure his young mind), and seldom in it. I put myself in his place when I choose; and when I don't choose, he occupies mine, with a sufficient absence of shining qualities. In fact, he combines the advantages of a foil and a substitute, and can be trusted to discharge the duties of the former admirably, and those of the latter as well as could be expected."

These two sketches, and especially the last, seem to invite the composition of a third, to be hung upon the same line, and necessitating a similar inquiry. What does Lord Hartington think of Mr. Gladstone? It is probable that in general he thinks of him very much as an enlightened Roman or Carthaginian general did of the elephants which accompanied his army. They were very large, very imposing, and tremendously strong, but painfully uncertain in their operation, and quite as likely to upset friends as to trample down foes. Lord Hartington, however, is not allowed the benefit of the device of which the strategy of the period referred to availed itself. He cannot place a mahout with a sharp chisel and mallet behind Mr. Gladstone to put a stop to his inconvenient exploits as soon as he shows signs of denouncing the House of Lords, or inviting Home Rulers to convert him to Home Rule, as their predecessors converted him to disestablishment, or charging a whole Continental nation with being in alliance with the evil one. He has to grin and bear it, and very hard it must be to do both. Lord Hartington can scarcely help imagining himself, with a shudder, called when in power to face an Austrian Ambassador after such an escapade of his leader-follower as last Wednesday's. It cannot be wholly pleasant to read declarations of fervent Liberals that Mr. Gladstone, and nobody but Mr. Gladstone, shall be their leader, and to look forward to a relapse into Postmaster-Generalship, or some more gilded slavery, after bearing the heat and burden of long years of Opposition. It is probable, also, that Lord Hartington would prefer to be informed beforehand of the peculiar direction which Mr. Gladstone's boomerang flights are likely to take. It might then be possible, if not to guard against them, at any rate to adjust the position beforehand. All these circumstances might well make Lord Hartington hesitate in giving his instructions to our artist. In public, of course, these instructions would not be difficult; and terms of almost filial veneration would doubtless flow from the lips of the leader of the Opposition, especially if he had not yet seen the morning papers, or if, for a wonder, Mr. Gladstone had not been speaking anywhere or writing anything. In private, and with the limitations proposed *ex hypothesi*, the task might be more difficult. It is almost alarming to think of the colours in which Lord Hartington, especially with Mr. Adam at his elbow, would have drawn his late chief just after the last Midlothian campaign; and everything goes to show that the same tints will be required again. Perhaps, on the whole, allegorical portraiture would be most satisfactory to the complicated and overcharged feelings of the chief of that Opposition which Mr. Gladstone has just pronounced sacrosanct. The already suggestive picture of the elephant slaying its foes by thousands and its friends by tens of thousands would make a fine picture of its kind. If, however, this be thought too distant, historical, and foreign, another trope of the same kind presents itself as not inappropriate. A bull in a china-shop is an object rarely seen in nature, though frequent in the mouths of men. It is not known, we believe, who first crystallized the idea and put it into effective phrase. But, whoever he was, he could hardly have had before him a more striking exemplification of his thought than the activity of Mr. Gladstone as it must present itself to the sorely-tried eyes of Lord Hartington's mind.

THE POPE AND THE *CULTURKAMPF*.

FROM the time when he succeeded to the Papal throne Leo XIII. has manifested, as indeed he had done previously in his offices of Nuncio and afterwards of Archbishop, that statesmanlike temper and capacity in which his predecessor was so signally deficient. The pastoral he issued only a few months before his election, as Archbishop of Perugia, though dealing largely with religious subjects and written throughout in a religious spirit, reads more like the work of a statesman than of a theologian. It reminded one of the tone of the Hildebrands and Innocents of a former age rather than of the compiler of the Syllabus, only that the future Pope contemplated the relations of the Church and civil society from the standpoint not of the thirteenth century but of the nineteenth. It has been from the first his avowed aim to bring about that reconciliation of the Church with modern civilization which the Syllabus, taken in its natural and obvious sense, pronounces to be impossible. To a pontiff thus minded it was of course peculiarly embarrassing to find that the policy of his predecessor, consistently pursued during a reign of unprecedented length, had left him the inheritance of something like an internecine feud between the civil and spiritual powers in almost every European country. In Italy, France, Switzerland, and Germany the state of tension was most severe, and in three of those countries it was such as actually to impede the ordinary routine of ecclesiastical work, and in some places to bring it to a deadlock altogether. Several sees in Italy and Germany, and hundreds of parishes were vacant, while in Switzerland the State had in many parishes substituted "Christian Catholic" pastors for those in communion with Rome. In France the contest had begun which has issued in the Ferry Bill, and of which, in spite of the rejection of the seventh clause by the Senate, we have by no means as yet seen the end. That in many of these cases the State was partially or entirely in the wrong, if judged by any standard of even-handed justice which English public opinion would recognize, is perfectly true; but if the State was in the wrong, it cannot fairly be maintained that the Church, as administered under the Ultramontane autocracy of Pius IX., was in the right. The Falk Laws were a clumsy and impolitic reply to the challenge of the Vatican Council, and even so zealous an anti-Vaticanist as Father Hyacinthe made no secret of his disgust at the illiberal partiality of ecclesiastical statesmanship at Geneva. But these procedings, just or unjust, were provoked by the Vatican decrees, and by the long course of studiously irritating and aggressive policy which culminated in the infallibilist triumph. Hard words, to be sure, break no bones, but such words as had for many years past emanated periodically from the Vatican itself, and from the various official or officious organs—such as the *Civiltà Cattolica* and the *Univers*—which were known to speak its mind, amounted to little short of a declaration of war against the whole framework and constitution of modern society; and such a declaration could hardly be ignored, when coming from an authority which aspired to "tune the pulpits" and the confessionals of half Christendom. An idea was growing up on both sides throughout the Continent that clergy and laity were natural enemies, and that there could be no enduring peace till one party or the other had gained the ascendency. The *Non possumus* of the Vatican was met in Germany, and elsewhere, by the defiant response, "We won't go to Canossa." The ecclesiastical authorities wholly failed to comprehend the temper of the age, while statesmen like Prince Bismarck

failed—as "men of blood and iron" always do fail—to appreciate the strength of moral forces, and imagined that consciences, enlightened or otherwise, could be crushed under the letter of the law. The result, as we observed just now, was a deadlock injurious to the best interests of all concerned.

This was the state of things two years ago, when Leo XIII. ascended the Papal throne, but he has already within that short period succeeded in effecting a considerable improvement, in spite of serious hindrances caused quite as much by his own side as by its opponents. Even in Italy some approach has been made to a better understanding between the rival powers, but there of course the difficulties are exceptionally grave, and it would greatly try the capacities of a consummate statesman, with the best will for devising an equitable arrangement, to discover a *modus vivendi* that should satisfy the reasonable requirements of both parties. In Switzerland, where the quarrel was very much of the Pope's making originally, though the Government showed itself more than ready to take up the gauntlet he had thrown down, matters appear to be satisfactorily adjusted. But in Germany, where more than a thousand parishes are reported to be now vacant, besides about half the bishoprics, the task of reconciliation was at once more urgent and not so easy. But here too, if we may trust the latest information, the tact of Leo XIII., and probably still more the confidence he has inspired—in place of the deep distrust created by the language and acts of Pius IX.—have proved equal to the occasion. He may have felt that he could afford to be generous, because in the main he had justice on his side. The provocation caused by the policy of the Curia, and the very natural suspicion it engendered of a radical hostility to German unity on the part of the Church, goes far to explain, though it does not excuse, the assumption on Prince Bismarck's part—as a distinguished English Liberal worded it—of the attitude of "a Pope in jackboots." We have often before now criticized in detail the provisions of the May Laws, some of which merely constituted a sentimental grievance, while others must be regarded as a direct intrusion into the spiritual sphere, and were resented accordingly by the Protestant as well as the Catholic clergy, many of whom were fined or imprisoned in consequence. The concession on what the *Times* Correspondent calls "the main point in dispute," contained in the final clause of the Pope's recent letter to the Archbishop of Cologne, deals with what was a sentimental grievance only. The passage in the English translation runs as follows:—

> The second year is now elapsing since we ordained that thou mightest unite thy prayers and those of thy believing flock with ours, that God, who is rich in mercy, might hear our supplications and haply restore that freedom, to the fulfilment of our wishes. This was not granted, but still firmly hope that, with the Divine aid, our efforts in this respect will meet with the desired success. Gradually, and little by little, hollow suspicion and its invariable accompaniment, unrighteous envy towards the Church, will cease, and the chiefs of the State, looking at facts in a favourable and appreciative light, will easily come to see that we do not interfere with the rights of others, and that between the ecclesiastical and political powers a lasting understanding may exist, provided only there does not fail on both sides the will and the inclination to maintain peace, or, if need be, restore it. That we are animated with this spirit and this will must be the firm and unflinching conviction of thee, reverend brother, and all believers in Germany. Yes, we cherish this will so decidedly, that in view of the advantages likely to result therefrom for public order, we make no scruple of declaring to thee that we, in order to hasten this understanding, will permit the name of those priests chosen by the Bishops as fellow-workers in their diocese in the cure of souls to be primarily submitted for approval to the Prussian Government.

This submission to the Government of the names of priests appointed to parochial cures had long been allowed in other parts of Germany, and although the right claimed might easily be used in a vexatious manner, it is hard to see how any question of principle can be involved in the mere formality, and the Prussian Government has all along had a veto on appointments to bishoprics.

The interference of the Falk Laws with clerical education was a matter of much higher practical importance, and here it is evident that the Government are prepared to make important concessions. The Bishop of Strasburg has already been permitted to reopen his seminary, and it is further reported that "a Bill repealing some of the more oppressive clauses of the ecclesiastical laws is being drawn up by the Prussian Government, and will no doubt be passed by Parliament." The same correspondent adds that all parties are agreed on there being no need to control the religious action of the clergy, if the Pope no longer objects—as Leo XIII. obviously does not object—to German unity under a Protestant sovereign. The Government will however reserve "the right to confirm the nomination of priests, to punish political agitation in the pulpit, and to supervise elementary education." On the first point we have already spoken. The second sounds strange to English ears, but all Continental Governments are more exacting in such matters than our own, and in practice everything would depend on how the right was exercised. Many clergymen in England have preached strongly against *e.g.* the divorce law, and the proposal to legalize marriage with a deceased wife's sister, and we should feel it to be a monstrous injustice if their liberty of speech were made penal; but the Government would—at least on Continental principles—be within its right in restraining attacks from the pulpit on the whole existing order of things, and "punishing political agitation" need not mean more than this. It would be felt in this country to be a grave impropriety, though not a ground for judicial interference, if a preacher were to tell his congregation what candidates they ought to vote for in an election to Parliament. The third right claimed by the Prussian Government, supervision of elementary instruction—that is, we presume, in its secular aspects—is not only exercised by our own Government, but universally admitted to be just and beneficial. No one can speak more distinctly on this point than Cardinal Manning in his recent Lenten pastoral, and what Cardinal Manning openly approves the most Ultramontane of German bishops need not hesitate to admit. His words are worth quoting. "No schools are under a more rigorous inspection than ours. . . . *This is a great benefit to us*, and a great security for good management. For anything and for everything we are liable to censure from the Government, from the Guardians, from the public newspapers. The censures are at times overstrained, and sometimes unjust, but their effect upon us is good. They keep us from careless or superficial management. We are forced to do our duty thoroughly and with all our might." Of a similar compulsion the German Catholics, if they are wise, will not complain. And meanwhile, as far as religious education is concerned, the new Minister who has succeeded Dr. Falk has already largely modified his policy in a denominational sense. The settlement of the controversy therefore will not be a triumph for either party, but a compromise in which each surrenders something, while securing all that its real interests demand; and this is in itself a guarantee for its permanence. There is no "minting of Canossa coins," but the *Culturkampf* seems to be coming quietly to an end. If it still leaves the German hierarchy under some restrictions unknown before 1870, for that they have to thank their own sudden change of front in view of the arbitrary Roman pretensions to which, after an illusory show of resistance, they passively succumbed.

Two collateral questions are naturally suggested by the apparently approaching close of the conflict between Church and State in Germany, on which however we can only say a word in passing here. It may be asked what effect the reconciliation is likely to have on the condition of the Old Catholics, and on the religious life of the Church from which they have seceded. There can be no doubt that in the early days of the struggle the Prussian Government saw its advantage in promoting a movement which might serve to hamper the action of its formidable rival, but this patronage, never very decided or cordial, has for some time been virtually withdrawn. And the internal dissensions of the Old Catholics, to which Professor Schulte called attention in a remarkable paper in the *Contemporary Review* last August, have conspired to their disadvantage with the prestige which a little mild persecution has inevitably conferred upon their opponents, while in Germany, as in Switzerland, the conciliatory policy of Leo XIII. has done far more to impair their prospects than the curses of Pius IX. His evident desire for their reabsorption into the general body may be disappointed, but it is less likely than under the late *régime* that their numbers will largely increase. On the other hand the likelihood is proportionately greater of the growth of what may, for want of a better name, be called an Old Catholic element within the visible unity of the Roman Church. The acquiescence of German Catholics, whether clergy or laity, in the Vatican decrees was notoriously in many, if not most cases, more ostensible than real, and the loyalty to their Church evoked by the aggressive action of the Falk Laws rather silenced opposition than secured assent. When the pressure is withdrawn, they will be at leisure to review the whole situation calmly, and may find that pretensions at once arrogant and unhistorical do not become more palatable by lapse of years. To judge indeed from the language of the Belgian Bishops and other high authorities who might be named, it has already come to be the avowed object of Ultramontane apologists to show, not how great is the import of the infallibilist dogma, but how small. If an objection is raised to any Papal pronouncement, it is at once thrown overboard, not without a contemptuous smile. The Pope was only expressing his own views, not defining doctrines; or he was dealing with personal matters; or he was speaking as a private doctor, not by apostolic authority; or he was not resting on the testimony of revelation. In short, he cannot have been infallible, for he was mistaken. If this is the tone enforced by the exigencies of controversy on the very authors and advocates of the dogma, when it is barely ten years old, what inference is likely to be drawn by those who were always its opponents? Leo XIII. has afforded fresh evidence of his discernment of the true interests of his Church in seeking to bring the ecclesiastical conflict in Germany to an end. But he would confer a more lasting boon on German Catholicism if he could heal the internal malady which the policy of his predecessor has bequeathed to it.

LIEUTENANT PALANDER ON THE VOYAGE OF THE *VEGA*.

Considering what very moderate achievements in the Arctic regions have of late attracted a large share of public attention, it is certainly surprising that an account of the voyage of the *Vega*, written by the commander of that vessel, should have received so little notice. In the pages of *Blackwood's Magazine* for the present month, Lieutenant Palander, of the Swedish navy, has told how the North-East passage was made. His account, though very clear and graphic, is so simple and unpretentious, and so brief, that it scarcely seems proportionate to the importance of what he has to narrate, and perhaps for this reason it has not attracted the attention of a public which, having seen failure described in elaborate volumes, can hardly believe that success requires only a few modest pages. It is to be hoped, however, that this neglect will not continue, and that Lieutenant

Palander's remarkable narrative will be read as it deserves; for, if it is thought to merit no more consideration than the many stories of travel which appear in magazines, his countrymen will certainly be justified in thinking that Englishmen are rightly charged with insular narrowness, and that they greatly magnify what their own sailors achieve, while they give little heed to what is done by the sailors of other nations.

There is no doubt one reason why an account of the North-East passage should not excite so much interest in this country as some other stories of Arctic exploration. Owing to causes not altogether easy to fathom, English navigators have for a very long period abandoned the idea of passing from the Atlantic to Behring's Straits through the seas north of Asia, and have devoted all their efforts to the attainment of other objects. This fact, however, can scarcely excuse the singular apathy which has been shown respecting Lieutenant Palander's story; and it must be remembered that, although the Asian Arctic regions have been neglected for a great while, Englishmen have not always been indifferent to the allurements of the Kara Sea, but that when the spirit of adventure ran most high, the Eastern Ocean was sought by English seamen. At the beginning of his history Lieutenant Palander gives a short account of previous attempts to make the North-East passage, from which it appears that it has been essayed by thirteen expeditions, five of which were sent from England. The first effort ever made was in 1553, when three ships —the *Bona Esperanza*, *Bona Ventura*, and *Bona Confidentia*—sailed from England. Other expeditions made for the North-East in 1556, 1580, and 1608, after which there was, so far as this country was concerned, a very long pause. Finally, in 1676 the last British expedition was despatched, and after it "there occurs," to use the writer's words, "an interval of two hundred years without any attempt to make the North-East passage. In 1872 the *Admiral Tegetthoff* was sent out by Austria and Lieutenants Payer and Weyprecht made their justly famous voyage. Finally, in 1878 the *Vega* sailed from Sweden, and Professor Nordenskiöld and Lieutenant Palander achieved what English sailors had first attempted more than three centuries before. Surely the narrative which the latter has recently published in this country merits as much attention as those which described the summer trip of the *Pandora*, and the very cautious exploration of Sir George Nares.

Over both it certainly has one great advantage already referred to—that of brevity. It seems, at first sight, highly improbable that Lieutenant Palander should be able to tell the story of such a voyage in a few pages; but he has undoubtedly succeeded in doing so; and, as need hardly be said, his curt history is full of interest. He first describes the fitting out of the *Vega*, which had been built for seal and whale-fishing, and was therefore suited for Arctic navigation. Her two principal officers and her crew belonged to the Swedish navy, and the Swedish Government gave great assistance in her equipment and in provisioning her; but she did not sail as a Swedish man-of-war, and had to carry the flag of the Swedish Yacht Club. As is well known, she left Gothenburg in the early part of July 1878, Professor Nordenskiöld, the projector and leader of the expedition, joining it afterwards at Tromsoe. The *Vega* left this place on July 21st, with her consort, the *Lena*, a small screw-steamer destined for the navigation of the river of that name, which was to accompany her during a considerable part of her voyage.

In the first part of their arduous undertaking the Swedish explorers appear from Lieutenant Palander's narrative to have had fairly good fortune. Entering the Kara Sea at what experience has shown to be the right time, they found it free from ice. Two vessels bound for the Yenisei had previously met them, and from one of these a final supply of coal was taken. On August 9, the Kara Sea having been crossed, these vessels had to leave the *Vega* and *Lena*, which then began their slow voyage along the flat Siberian coast. At the outset they found that the charts of this coast were very erroneous, and that they must make their way as best they could without putting any trust in their maps. The difficulty thus caused was a very grave one, but it cannot have been by any means unexpected, and is indeed such as all Arctic explorers necessarily have to contend against. It is to be observed, however, that with the *Vega* the utter untrustworthiness of the charts was specially trying. During a great portion of her voyage she had to keep close to the coast, and the water on the northern shores of Siberia is exceptionally shallow. The vessel therefore was incessantly in danger of grounding, and the explorers had literally to feel their way. How extremely trying, therefore, the work of Lieutenant Palander and his associates must have been will be seen at once by any sailor who reads his narrative; but, owing to its simplicity, brevity, and to the absence of any attempt to dwell on the dangers which had to be encountered, this may not be so apparent to all readers. To make the difficulties of shallow waters yet greater, there were the constant fogs of the Eastern Arctic Ocean, which Lieutenant Palander pronounces to be "more dense than anywhere else in the world." Perhaps if he had been in London lately he would retract this statement; but it must be said that in frequency the fogs of the Siberian coast appear to exceed even those of the British capital. Despite them, however, the *Vega* made good progress, and on August 19 she safely passed Cape Tchelyuskin, the northernmost point of the Old World, which had never been doubled by any vessel before. Nature has not always given to the extreme points of continents the attention they might be thought to deserve, and from the silence of Lieutenant Palander respecting the appearance of Cape Tchelyuskin, it may be gathered that this was not remarkable. Its true geographical position, which was carefully ascertained, was found to be not a little different from that previously laid down. It is in lat. 77° 36′ N., long. 103° 25′ E. After doubling it the *Vega* made her way with fair rapidity to the south and to the east. Near the delta of the Lena river she parted from her excellent consort the *Lena*, which had to proceed up that great stream to Yakutsk. From the delta a favourable wind carried the *Vega* some distance on her way; but, though she made good progress, disappointment awaited Professor Nordenskiöld when the ship drew near Liakov Island. Here he had hoped to land and collect fossil remains; but, owing to shallow water and to fogs, a landing could not be effected, and the mammoth bones remained undisturbed. Continuing her easterly course, the *Vega* reached Cape Sholagskoi; but, after this was passed, the ice, which rapidly increased, made further progress extremely arduous. Notwithstanding, however, the difficulties caused by ice, by fogs, and by water so shallow as sometimes only to leave a few inches under the keel, the voyage was continued past Cape Yakan; past the mysterious Wrangel's Land, supposed to be inhabited by an aboriginal race; past the point absurdly called North Cape, and across Koliutchin Bay. A point to the east of this was reached on September 28th, and the *Vega* was now close to her goal—that is, to Behring's Straits. Of 4,000 miles, all but 120 had been accomplished, and for those 120 miles the course lay through waters which are usually navigable for some weeks after September 28th. To traverse this small distance, however, was, in the autumn of 1878, absolutely impossible. The ice collected early, and the unfortunate explorers, with success almost within their grasp, with the eastern outlet of the Arctic Ocean almost in sight, found themselves doomed to pass a winter on the coast. After the 28th the cold increased rapidly, the weather remained perfectly calm, and it soon became evident that until the next summer the *Vega's* chance of reaching the sea of Kamtchatka would be about on a par with that of reaching the North Pole.

The unexpected arrest of the vessel's progress—news of which, it may be remembered, reached Europe—does not seem to have in the least dismayed the hardy and patient Swedes. Preparations were at once made for rendering the *Vega* as comfortable as possible during the winter, and for carrying on those mysterious scientific observations which have so deep a charm for Arctic navigators. In this case the scientific works certainly had the merit of providing full occupation for all on board the vessel, and neither weariness nor depression seems to have been felt during the winter months. The explorers were not altogether thrown on their own resources during their captivity, for the coast off which they were icebound was inhabited, and the natives proved to be excellent people. It is a most singular fact that, of all primitive races, those who dwell in the most barren and forbidding regions are apparently the best. The good qualities of the Esquimaux are well known, and the Tchuktchis of Eastern Siberia seem to be at least their equals. Lieutenant Palander describes them as "good-natured, friendly, hospitable, and honest," and says that, though numbers of them were constantly on board the ship, during the whole winter, only two or three thefts of the most trifling description were committed. Treated with wise kindness and liberality by the Swedes, they were useful in various ways, and were able at times to supply the mariners with fresh fish or reindeer flesh. These were of course most acceptable, but were not indispensable, the *Vega* being admirably found in stores. Lieutenant Palander gives a table of the dietary, which proves how well the ship had been provisioned, and what careful forethought had been exercised. As the crew remained perfectly healthy during the winter, and as no symptom of scurvy ever appeared, this table may be considered to show the diet which is best suited for Arctic regions, and is therefore well worth attention. As might be expected, preserved vegetables figure very largely in it, and it may horrify the followers of Sir Wilfrid Lawson and Dr. Richardson to learn that a gill of rum or brandy was served out daily to each man. A small quantity of tobacco was also given, and there was of course an allowance of lime-juice every day. The variety of good food shown by the dietary is most remarkable, and since for once what was agreeable proved to be wholesome, it is greatly to be hoped that, should there be any future Arctic expeditions, the valuable experience of the Swedish explorers may be utilized, and the diet which kept the crew healthy during the worst period of the year followed as closely as possible.

The men must have needed some physical comforts to cheer them, as their utterly unexpected detention lasted nearly ten months. The vessel remained firmly bound until July 18, 1879, when Lieutenant Palander noticed that the line of the tidometer showed astern, and immediately afterwards saw the ice to landward separate from the outer ground-ice belt. Steam was got up, and at 4.30 P.M. the vessel was in motion. That evening she reached a navigable sea, having got away from the place where she had so long been held fast "as quietly and with as little trouble" as if she "had gone out to sea from a common harbour." On July 20 East Cape was passed, and the North-East passage completed. Having been thus entirely successful in their great undertaking, the explorers, after a short delay at some islands near the Straits, set their course for Japan, and arrived at Yokohama on September 2.

Their voyage must certainly take rank as one of the most remarkable ever made in the Arctic Ocean. The difficulties they had to encounter were no doubt less than those against which other navigators in Arctic seas have had to contend; but never-

theless they were in all probability such as could only have been overcome by very skilful and very determined men. How great they were cannot be easily learnt from Lieutenant Palander's narrative, since, unlike most travellers, he seems anxious to speak as slightly as possible of the obstacles he was able to overcome. His reticence is to be admired, and should do him no harm with English readers. It is for those who have failed to indulge in many words. Those who have succeeded can afford to be brief.

INJUDICIOUS WOMEN.

A RUDE man who was told that a certain lady was a little injudicious asked his informant whether he had ever known a judicious woman. If such a question were put to us, we should reply that we know not only judicious, but over-judicious, women. We might even add that we know women who are as wise as serpents; though not as harmless as doves. But whether women are always injudicious, or, as we maintain, sometimes the contrary, it must, we should think, be generally admitted that they are occasionally jealous. When one lady is jealous of another she instinctively talks a great deal about her, and the general drift of her remarks under such circumstances must be pretty familiar to every one whose acquaintanceship is not confined to the male sex. It is certain that she will never admit her jealousy; but beyond that there is no saying what observations she may make about her enemy; nor will she miss any opportunity of saying an unkind word of her. She will generally contrive, however, that none of her weapons of attack shall be so damaging as her praise. She will allow that her enemy is beautiful—beautiful as a tigress—but she will affirm that she is wicked; she will admit that she is amusing, but she will declare her to be ill-natured; if she calls her innocent, she also calls her silly; and if she praises her as true-hearted and trustworthy, she stigmatizes her as unsympathetic and uninteresting. If she begins by describing her as clever, she goes on to hint that she is an infidel. If she praises her balls and her parties, she abuses her for being too fat or too thin, a bad caller, or a Roman Catholic. There are plenty of other faults with which ladies accuse each other behind their backs; such as inhospitality, idleness, having "odd people" to stay with them, frequently changing their servants, and even telling lies; but it is needless to multiply instances. When, however, a lady is so renowned for her personal goodness and excellence, her social charms and her unselfishness, that any attack upon her character with the usual weapons would be worse than useless, her opponents resort to the equivocal subterfuge of calling her injudicious. We wish to call special attention to this point, because, after some experience, we have come to the conclusion that in a large number of cases this is the most unfair and unwarrantable of all the forms of backbiting attack ever stooped to by woman, which is saying not a little. It is worthy of classification with the "You will be sorry for it when I am gone," or the "Please yourself; pray do not consult *my* wishes," of the direct feminine attack; and we veritably believe that some women consider that any woman who is charitable, kind, and unselfish, must *ipso facto* be injudicious. If one lady hears that another has built a church or endowed a scholarship, she is generally ready, like a true Bible-loving Englishwoman, to say, "To what purpose is this waste?" or words to the same effect.

It is all very well to have a stall at a fashionable bazaar for the relief of a famine in Beloochistan, or to be one of the lady patronesses of a charity ball; but to visit in person a squalid lodging in a back street, and carry food and clothing to a starving family, is considered injudicious. There are "proper people" to do all these things. Are there not the district visitor, the clergyman, the relieving officer, and the parish doctor? How much better it would be if Lady Jane would fulfil the duties of her own position and remember her station! It would be quite useless to reply to the speaker that there are "proper people" to do some of the things to which she devotes much of her time; that there are professional comedians to act, that there are gamekeepers to follow the shooters, that there are wise men to give opinions upon things "not understanded of women," and that there are stable-boys to talk slang. It would be worse than useless to suggest that it might be better if she herself attended a little more to the duties of her position, and if she were not so apt to forget her station in life. To say such things would be futile, because she connects most injudicious acts directly or indirectly with charity, and of charity she is certainly not guilty; therefore she cannot believe herself to be injudicious. It is quite permissible for a girl to dance till three or four o'clock in the morning, and then to drive several miles home on a snowy night, but it is thought imprudent to get up at seven o'clock to go to an early service. The latter is fatiguing and might expose the devotee to cold. Then it is quite right and proper to pay forty guineas for a dress, but to give five shillings to a poor person is most injudicious; giving such a large sum to one person is robbing others, and so much in a single case is quite uncalled for. It is simple extravagance, and the indulgence of such indiscreet charity may soon lead the donor into serious embarrassment. Moreover, it is wrong because it tends to pauperize the recipient, and it is mischievous in principle because it helps to hamper the working of the Anti-Mendicity Society. There is another thing also about that five shillings. The case in which it was given was not a deserving one. The husband of the woman who received it was once seen drunk; therefore, to give her money—and so much too—is directly to encourage vice. "Depend upon it some of that money would be spent in drink," says the speaker, as she finishes her glass of 1858 Lafitte. Again, as regards visiting the poor, it is very right that ladies should drive about picturesque country lanes in comfortable pony carriages, district visiting, provided there are no fevers about; but if they rarely go to any cottages unless the occupants are ill or in serious want, and then pay frequent visits until the distress is alleviated, they come under the social anathema. "A friend will say "How very injudicious Lady Jane is. She suddenly took up some cottagers named Smith, whom she had never been near before, and went to see them every day for a month, taking soup and wine and meat and even bread, and then she suddenly dropped them, and I hear that she has not been to their cottage for weeks and weeks"; the truth being that, while the Smiths had illness or serious want in their house, she assisted them, but when they were off the sick list, or when work was found for the husband and sons, she left them to themselves. It is not only among the lowest classes that poverty exists; but, although it is quite legitimate for a lady to visit and help cottagers, under certain restrictions, she is considered to be interfering where she has no business, and to be lowering herself, if she visits and assists people in distress among the middle classes. There is another kind of charity which exposes a woman to the charge of being injudicious. This is showing kindness and hospitality to little-known newcomers in an exclusive neighbourhood. People with good credentials are sometimes looked upon coldly for months after their arrival in a new neighbourhood, and the time spent in a freezing social atmosphere is both wearisome and unpleasant in the extreme. When, therefore, an old resident is philanthropic enough to break the ice, and to invite them to meet their neighbours, she appears to the new arrivals to be the very incarnation of charity, while to the old neighbours she seems an excessively injudicious woman. Then, again, hostesses who give grand balls and other entertainments to their friends are excellent people; but ladies who give servants' balls, or entertainments to the poor, "do an infinite amount of mischief." At best, if nothing else can be said against the acts of charity of a kind-hearted woman, "it is a pity that she does not consult her clergyman before giving away money or meddling among the parishioners."

One celebrated statesman lately said of another celebrated statesman that he had not a single redeeming vice. Now if, in an otherwise spotless female character, it is tolerable that there should be one redeeming weakness, we are inclined to think that a slight absence of the judicious character in her charitable actions is the most endurable. It is well that men should be a little stern in cases of mendicancy, and it may be necessary for them to send a beggar or two to the county gaol now and then to encourage the others; but while the husband looks very terrible at Petty Sessions, and inquires with searching severity into all cases of professed distress or vagrancy, we are not very sure that we like to see the wife too austere in cases of want and destitution, even when the sufferers have been reduced through their own neglect or vices. Every case of distress, whether deserved or not, merits a certain amount of pity, and we venture to think that a woman looks as interesting when nursing a sick poacher as when nursing a sick clergyman. Pauperization is, we admit, a very terrible evil; but want of tenderness in woman is a still greater. It may be gratifying to reflect that beggars are no longer encouraged; that charity is managed by boards and committees, and that the undeserving, at any rate among the poor, meet with their due; but we have made such wonderful progress in these directions within the last few years that we may afford to give a little toleration to a woman here and there who is so injudicious as to distribute alms according to her own private judgment, without consulting boards, curates, or district visitors.

It seems sometimes to be forgotten that there is more than one description of injudicious woman. There are, for instance, women who repeat things about which they would wisely be silent, who speak ill of their neighbours, and irritate where they might soothe. There are ladies who goad their husbands into extravagant expenditure, and urge them to engage in ambitious projects from which they would naturally shrink. There are women who overfeed themselves while they neglect to feed the poor, and overfatigue themselves with dissipation, although they fancy themselves too delicate to engage in the most trifling works of charity. They are unhappy unless they have three times the number of servants necessary for their wants, and yet they themselves are the abject slaves of society. We admit that such women as these are very injudicious, nor do we offer the slightest excuse for them. Our gallantry, again, is not sufficiently pronounced to enable us to defend ladies who are so injudicious as to assume the prerogatives of men, to ape the manners of a class of women of whose very existence they should be ignorant, or to talk glibly upon subjects concerning which they are profoundly ignorant.

We think we have sufficiently shown that we have no wish to cloak the fact that there are such creatures in the world as injudicious women; but, while we freely admit both their existence and their enormities, we contend that there is something to be said in favour of that special type of injudicious woman which errs in the direction of excessive charity and liberality; and we own that, when we are told by a lady that some one whom we have never seen is injudicious in the exercise of her benevo-

lence, we are inclined to a certain prepossession in her favour. There are certain forms of female praise which are very damaging; but, on the contrary, feminine abuse for injudicious liberality may generally be accepted as presumptive evidence in favour of the accused.

ELECTION ADDRESSES.

If the glory of elections has somewhat departed with the disappearance of the hustings and the appearance of the Ballot, the comparative disuse of treating and the almost entire disuse of direct bribery, there are still elements left in electioneering to divert the outsider who is not too busily engaged in getting himself or somebody else elected. The independent Bridgewater elector who epigrammatically remarked to the late Mr. Bagehot, "I'm not going to do nothing for gentlefolks, unless gentlefolks does something for I," expressed a feeling of humanity which is common, if not wholly praiseworthy. The gentlefolks who are at this moment so busily claiming the honour of being allowed to sit up till six o'clock in the morning or six o'clock the next evening listening to Mr. Biggar are not permitted to do much directly for their fellow-creatures; but they provide him, if he be of a studious turn, with an immense amount of literature which is not destitute of amusing features. The amusement is indeed generally indirect, for the man who would dare to write a deliberately comic election address would be a bolder man —if his candidature were serious—than Achilles or Almanzor. Of indirect comedy, as well as of direct edification, there is, however, plenty to be found in the voluminous manifestoes which are just now gladdening the hearts of newspaper managers, and occasionally irritating the tempers of newspaper editors. Nor was there ever a period when the volume of such matter was greater. Time was when elections were almost purely local matters, and little except their result interested outsiders. Nowadays voters are so much scattered that election addresses intended for Cornwall have a public in London. Perhaps the majority of them—certainly a very large number—thus find their way side by side into the columns of the London papers, and what might once have been a toilsome study of comparative criticism becomes light and easy and capable of being prosecuted at the breakfast-table; for the freedom of which, by the way, once so famous, we do not on this occasion observe the slightest demand.

The philosophy of election addresses is perhaps to be better studied in the compositions of the political rank and file than in those of the leaders, if only for the simple reason that the obscure are necessarily the most numerous. Considering that the preparation of these documents must frequently be a severe trial to gentlemen who have not, as a rule, studied brevity in composition, it is almost surprising that a regular profession or subdivision of a profession has not sprung up to meet the demand. Some of the youthful persons who, in obedience to a suggestion of Mr. James Payn's, are now being trained up in literature, might be specially devoted to this department; for, though the occasions of exercising their skill would not be numerous, the fees would be proportionately high, and the qualifications required are somewhat peculiar. The ideal election address is a document the positive and negative properties of which are numerous, and not such as all comers are able to impart. An election address must not, save in very exceptional instances, be very short, for in that case there is an appearance of disrespect to the constituency, who may well think that ink and lamp oil should have been expended more generously. It should not be too long, lest haply the patience of the constituency should break down in the middle, and thereby miss the most effective points. In this latter respect the leader of the Opposition seems to have committed an error. Again, it is well that an election address should not be too argumentative, wherein also Lord Hartington comes short of perfection. For one of the first duties of an address, especially of a leader's address, is that it should be rousing and inspiriting. Now the effect of argument is occasionally rather soporific than stimulant. On the other hand, in the attempt to be trenchant excessive dogmatism and the airs of the superior person are carefully to be eschewed. It is a question how far epigram and piquancy are permissible. The literal meaning of the word "piquant" is understood to be pricking, and the danger of piquancy is that you occasionally prick the person whom you wish to conciliate. An agreeable instance of this misfortune has just been given by the right honourable member and candidate for the University of London, who, in endeavouring to throw stones at Lord Beaconsfield, projected his missile with happy directness, not merely in the face of the unfortunate correspondent whom he ostensibly addressed, but also in the faces of a solid phalanx of the constituency. On the other hand, a heavy address is not likely to win many votes, if it be not in any great danger of losing some. Opinions differ very much as to the propriety of being accurate in the statements made in these documents. On the one hand, it may be contended that very few of those who are addressed know the facts, and that a fiction is just as good to repeat and flourish in the face of an adversary as the fact itself. Against this may be set the consideration that it is unpleasant to some people (though not, it seems, to all) to be convicted of deliberate misstatement, and that the eyes of opponents are somewhat quick to detect anything of the kind. There is also a divergence between the ancient and the modern practice in the point of making reference to the individual interests of the constituency contested. This used to be done almost universally in England, and is still done almost universally in France. The progress of civilization, however, has rendered it in some cases difficult. There are now few towns which still require to have roads or railways brought near them, and not very many which have an industry so decidedly staple that it can safely be taken under definite protection. This makes the candidature of those who seek University seats rather easier than that of ordinary wooers of boroughs and counties, where interests are apt to jar. Human nature, however, being what it is, references of this kind, where practicable, are probably not unwise.

So far we have have dealt with the philosophy of election addresses chiefly in the abstract; but abundant illustrations are at hand. But few candidates, it is probable, could attain the heroic height of self-satisfaction with which the sitting members for Birmingham laconically inform their constituents that, in a faithless and backsliding Parliament, they, at any rate, have done their duty. It is more usual to hint modestly at an endeavour to perform that not always easy task. 'Tis not in mortals—except in Messrs. Bright, Muntz, and Chamberlain—to command success in such an attempt, and the inference obviously is that it is vain for any ordinary mortal to compete with them. Modesty, however, is not universal even among candidates less good and great. When the eye falls upon the confident announcement "the Liberal party has not the least wish to separate Ireland or any other part of the United Kingdom," it naturally travels down the page expecting to see the signature of Lord Hartington, of Mr. Gladstone, of Mr. Forster, or at least of Mr. Goschen or Mr. Lowe. But the gentlemen who thus take upon them to speak for the Liberal party are Messrs. W. H. Stone and J. Ebenezer Saunders, of whom all that we can say is that they are candidates for Greenwich, and that from another sentence in their address they appear to have arrived at the conclusion that, jointly, they are about equal to Mr. Gladstone. It is natural that documents of this kind should exhibit a somewhat wide divergence of opinion. For instance, Mr. Charsley in Buckinghamshire is quite certain that, unless local taxation is altered in favour of the landowners and landholders, terrible things will happen; while Mr. Thorold Rogers in Southwark is equally certain that taxation must be altered in favour of those who do not hold or own land. In Marylebone Mr. Daniel Grant considers it evident that the depression of trade is due to the policy of the Government; while in Lambeth Sir James Lawrence, who probably considers himself as good a Liberal as Mr. Grant, informs us that the depression of trade cannot fairly be charged upon them. The reform of the Bankruptcy Law is the darling project of Mr. Arthur Cohen, Q.C., and this, he owns to the inhabitants of Southwark, seems to him of more importance than a great many other things. Elsewhere a singularly vague but very tempting promise has been discovered in the phrase, "the appropriation of funds hitherto improperly diverted." Obviously, the "proper diversion" of funds, though something of a contradiction in terms, would lead them to flow into that pocket in which the voter holds his hands—and possibly not much else—as he reads the inviting placard. Mr. Reed at Cardiff is business-like and truthful. "Gentlemen," he says, "you have other things to regard besides home and foreign policy. You have the interests, the business, the prosperity, and the reputation before the world of Cardiff itself to consider." There is the good old all-Muggleton ring about this. On the other hand, Mr. Samuda, save by a vague reference, seems to assume that the Tower Hamlets think only of foreign affairs and free trade to the exclusion of baser and more particular matters. A phrase which we like, and which is new to us, is to be found in the address of Mr. Robinson, a competitor for East Surrey. "I offer myself," says Mr. Robinson, "as one of your Liberal candidates." "Your member," "your representative," are of course common, but "your candidate" is new. It suggests the signature of a letter—I am your obedient candidate, your poor unfortunate faithful candidate, and so forth. There must be a certain pride in the soul of the elector who finds himself in possession of so fair a herd of candidates.

Speaking generally, the election address, like most other things in this world, divides itself into three classes. There is the address which is obviously the work of its ostensible author, who is well enough accustomed to such work; there is the address which is also original, but whose author is not quite a deacon in his craft; and there is the address which has been composed by a talented and obliging friend, and which bears marks of joint authorship. In the two former cases, the reader is often tempted to remember a certain sentence of Thackeray's and to imagine that it expresses the author's feeling. "Though I have written the above paragraphs myself, and don't understand a word of them, I can't upon my conscience help thinking that they are mighty pretty writing." A postscript of this kind might perhaps fairly be attached to a certain manifesto which led the van, and to not a few of its followers. In the third case—the case where the time-honoured phrase "I take up my pen," would be less appropriate than "I take up somebody else's pen"—the ostensible author, if he is wise, will leave his coadjutor full liberty of action and expression. Collaboration in such cases is fatal, and can rarely be concealed, though it would be unkind to point out individual instances of it. It may be noticed also that in this as in other instances the last comer is by no means at a disadvantage. It is, we believe, an article of faith among election agents that to get your address out first is somehow a benefit. From a literary

point of view it is very much the reverse. For you can obviously, instead of stating your own views, be down upon your opponent's shortcomings, which is not only much easier, but also much more exciting and stimulating to the readers. Such are the outlines of the philosophy of election addresses, with examples of the most recent date. They are very heartily at the service of belated candidates, who with their aid can hardly fail to produce masterpieces before the event of next Wednesday makes addresses give way in point of practical importance to the more uniform and monotonous compositions of the Clerk of the Crown.

TASTE, SHAKSPEARE, AND THE MUSICAL GLASSES.

MR. JAMES PAYN, who seldom writes without being amusing, has contributed to the *Nineteenth Century* a characteristic article on "Sham Admiration in Literature," a thing of which there is no doubt plenty in existence, almost as much, perhaps, or indeed quite as much as there is of sham admiration in pictorial and sculptural art. Probably there are as many persons who speak with bated breath of Shakspeare and the musical glasses in entire ignorance of what they are talking about as there are people of the Cimabue Brown class, who go into esoteric raptures over things of which they have no suspicion of knowledge. An astute Jew in one of Lever's novels observes that there are three things which people will do as long as the world goes on—make love, make war, and gamble; and he might perhaps, without fear of contradiction, have included sham admiration in his list of perennial attitudes of mind or action. The sham admiration, however, which Mr. Payn in the main justly holds up to ridicule is not of the esoteric kind, but is of that wider sort which includes things which the majority of mankind have agreed to be excellent, and which the sham admirers think it perfectly safe to admire. "There are," as Mr. Payn says, "certain books which are standard, and, as it were, planted in the British soil, before which the great majority of us bow the knee and doff the cap with a reverence that in its ignorance reminds one of fetish worship, and in its affectation of the passion for High Art." This, no doubt, is generally true, but we doubt if the illustrations which the writer proceeds to give are altogether happy. The first instance he adduces of books "without which no gentleman's library can be considered complete," and which the person who affects a sound literary taste feels himself bound to admire, is *The Rambler;* and it seems to us to be open to question whether, to begin with, the sort of people at whom Mr. Payn's satire is aimed have ever heard of *The Rambler;* and, in the second place, whether, if they have heard of it, they find it a duty to praise it, unless indeed they happen to have mixed it up with *The Spectator*. Indeed, if *The Spectator* were substituted for *The Rambler*, the following remarks of the writer would perhaps have more force:—"Given the age of the ordinary individual—that is to say, of the gentleman 'fond of books, who has really no time for reading'—and it is easy to guess his literary idols. They are the gods of his youth; and whether he has been 'suckled in a creed outworn' or not, he knows no other. These persons, however, rarely give their opinion about literary matters except on compulsion; they are harmless and truthful. The tendency of society in general, on the other hand, is not only to praise *The Rambler* which they have not read, but to express a noble scorn for those who have read it and don't like it." Mr. Payn himself read *The Rambler* and did not like it; indeed, when he was shut up with it and a Shepherd's Guide for all literary food in a mountain inn, he was very glad to have the Shepherd's Guide to turn to; and we are far less disposed to find fault with what has been well called his "literary palate" in this instance than in some others, to the chief one amongst which we may as well come at once.

This instance will seem so startling to many people that it may be desirable to set forth Mr. Payn's confession or defiance in his own words. "I remember," he writes, "in my own case that from that mere reverence for authority which I hope I share with my neighbours, I used to speak of *Headlong Hall* and *Crotchet Castle*—both great favourites of our forefathers—with much respect, until one wet day in the country I found myself shut up with them. I won't say what I suffered; better judges of literature than myself admire them still, I know. I will only remark that *I* don't admire them. I don't say they are the dullest novels ever printed, because that would be invidious, and might do wrong to works of even greater-pretensions; but to my mind they are dull." It is impossible not to admire the candour of this statement, as well as the kindly and condescending reticence of its concluding sentence; but it suggests food for some curious reflections. It is in the first place, or it seems to be, a strange inference that, because these books—two of Peacock's happiest efforts—were great favourites of our forefathers, therefore they are not now great favourites. The deduction is illogical, and the conclusion involved in it, we venture to say, is not correct. They are great favourites still with most people who know them and a curious proof of the virtue that is in them was given by the success, with the larger number of people who do not know them, of a singularly coarse imitation of their style and method which a few years ago made some noise. This defect, as it seems to us, in Mr. Payn's appreciation, is the more odd, because he himself has much of the qualities of light true humour and close observation, of giving just the right touch of exaggeration to his satire, which adorn Peacock's writings. But, then, three-volume novels were not quite so recognised an institution in the days of Peacock, though even about that period their tyranny was beginning to be felt, as they are now; and possibly the now unusual form in which the works are cast had something to do with Mr. Payn's dislike to them. Form of this kind, in these days of rapid reading, has in such matters an influence quite out of proportion to its real value. But if Mr. Payn is entirely wrong in his estimation of Peacock, it is worth while to remember that Peacock was equally wrong, or more wrong, in his estimation of a greater writer than himself. In *Crotchet Castle* there occurs a passage referring to Sir Walter Scott, which it may not be amiss to give at length, as there is every reason to believe that the sentiments put into Dr. Folliott's mouth represent with more or less accuracy Peacock's own opinions. The party, we are told, fall into a discussion on legendary histories:—

Lady Clarinda. History is but a tiresome thing in itself; it becomes more agreeable the more romance is mixed up with it. The great enchanter has made me learn many things which I should never have dreamed of studying, if they had not come to me in the form of amusement.

The Revd. Dr. Folliott. What enchanter is that? There are two enchanters; he of the North, and he of the South.

Mr. Trillo. Rossini?
